While male cruising is far more visibly widespread, cruising has been instrumental to fostering lesbian subcultures, too. In Bangkok, for example, the Mah Boonkrong shopping complex (known more commonly as MBK) emerged in the 1990s as a major site for toms (butch women, from the English “tomboy”) to look for dees (femmes, from the English “lady”) as sexual partners (Wilson 2004). In US-based contexts, scholar Sally Munt has examined the figure of the flâneur, usually a man of means who took to strolling urban areas for leisure (1998). Munt builds on the work of Walter Benjamin (who in turn drew on Charles Baudelaire) to emphasize the importance of flânerie—of strolling to see and be seen, to be a gentleman investigator of the capitalist city. For Munt, there is also a tradition of the “lesbian flâneur,” which she maps onto various characters in literature as a “lesbian vindication of the right to cruise” (41), thus making an important theoretical intervention by connecting flânerie with queer theory. Examining several novels, she describes “butch dandies” strolling through the lesbian bars and spaces of New York in one book, and in another, the “parodic portrait of the bulldagger as Parisian flâneur, complete with Freudian phallus (the cigar)”—a workingclass butch who can pick up women and who has sex next to some deserted train tracks (44).

Women’s sexuality has been heavily policed historically, and this includes cruising and public sex between women. Sarah Lamble documented the court case R. v. Hornick (2002), which resulted from a police raid on a women's bathhouse in Toronto, Canada. In September 2000, five male officers raided a sold-out bathhouse event known as Pussy Palace, investigating liquor license violations and criminal sex acts, and later charged two members of the Toronto Women’s Bathhouse Committee (Lamble 1999). The Bathhouse Committee won the case when the court ruled that the police had violated the women’s security and privacy. Davina Cooper considers the cruising between women in queer feminist bathhouses to be an important part of a feminist ethics of care. However, she notes that some aspects of the bathhouse events hosted in Toronto, such as the emphasis on “sex, the self, stranger relations, and pleasure,” posed challenges for maintaining feminist care ethics (2009, 106). Organizers had looked to gay male bathhouses for inspiration—a fact that some criticized. She also describes the racism and transphobia that can flourish in the highly sexualized environment, which constitutes “crimes against the bathhouse” rather than private harms, and identifies these as an important point for feminist analyses of women’s public sexual practices.

Online Cruising
Gentrification, moral policing, and on-line apps have all taken their tolls on cruising, cruising grounds, bathhouses, and public sex. However, *Spartacus* still listed thousands of cruising grounds in its 2016 global guide. Grindr and similar apps may be seen not as weakening cruising culture but as representing an evolution in cruising. Viewed this way, the apps provide more efficient modes of the same looking, flirting, chatting, sizing others up, and checking out others’ bodies that occurs in Brazilian public restrooms during *banheirão*, in the parks of eighteenth-century Paris, and on the escalators of a Bangkok mall. Thus, Grindr can be read as merely the contemporary part of a much larger queer archive of cruising and its attendant visual and embodied pleasures.

The Cuban Revolution and Homosexuality

DAVID TENORIO
Assistant Professor of Spanish
University of Pittsburgh, PA

The Castro regime's policy toward and treatment of homosexuals.

Along with the Mexican Revolution (1910–1920), the Cuban Revolution (1953–1959) was one of the most momentous social enterprises to seize international attention in Latin America and the Caribbean during the twentieth century. The revolution helped significantly revamp the political left, as it represented the epitome of anticolonialism and American interventionism, as well as self-determination, self-governance, and social welfare. The period known as the Cuban Revolution is often situated as starting in 1953 with the first insurgent uprising and culminating with the Cuban dictator Fulgencio Batista’s (1901–1973) escape from the island on 31 December 1958. As a radical rearrangement of sociopolitical and cultural structures, the social reforms brought about by Fidel Castro’s (1926–2016) revolution did not always positively address issues of gender and sexuality in Cuba. The sexual politics of the Cuban Revolution are at times contradictory, yet historically and culturally contingent. At the very base, any gender or sexual practice, value, or expression that was unaligned with the heterosexual, masculinist nationalism embraced by the Communist regime after 1959 was perceived as an act of counterrevolutionary dissidence that had to be eradicated to contain the growth of “antisocial” sentiments that could hinder the teleology of progress embodied by the Castro regime.

SEXILIO AND MIGRATION

The term sexilio refers to “sexile” (sexual exile)—that is, the migratory experience that LGBT individuals from Latin America and the Caribbean undergo based on sexual orientation, gender expression, and/or sexual practices. This forced displacement occurs as a response to state persecution, social violence, or discrimination owing to their nonadherence to normative sexual identity, practices, and discourses. In the context of Cuba, the apex of the queer diaspora took place between 20 April and 31 October 1980, during what is commonly known as the Mariel boatlift, under Fidel Castro’s socialist regime. Following an incident at the Peruvian embassy in Havana in 1980, in which a bus driver drove a bus full of passengers onto the embassy’s premises in a desperate attempt to seek political asylum, Castro announced that Cubans wishing
to leave the island were permitted to do so through Mariel Harbor, located 40 kilometers (25 miles) west of Havana.

This decision came after a very stringent foreign affairs policy under which Cubans needed special approval to leave or travel abroad. In the midst of tense political relations between Cuba and the United States, social unrest on the island grew rapidly as certain factions of society that strongly supported the regime showed disdain and disgust for those wanting to leave. Castro extended an invitation to Cuban Americans to come with boats to pick up any relatives wishing to flee. However, when the passenger ships arrived, Castro not only allowed relatives to travel but also ordered all social “scum” (escoria)—such as homosexuals, prostitutes, criminals, and the mentally ill, against whom he led a public excoriating campaign—shipped to the United States. In his autobiography, the exiled Cuban writer Reinaldo Arenas describes how

to be able to depart from the Port of Mariel, people had to leave the Peruvian embassy with a safe-conduct issued by State Security, and had to return to their homes and wait until the Castro government gave them the order to leave…. The homes of those waiting for exit permits were surrounded by mobs and stoned; in the Vedado, several people were stoned to death…. Opposite my room someone had put up various posters reading: HOMOSEXUALS, GET OUT; SCUM OF THE EARTH, GET OUT.

(1993, 279–280)

The first Cubans disembarked in Key West, Florida, on 21 April 1980. Overall, approximately 125,000 arrived as part of the Mariel boatlift, which constituted an immigration crisis and created a diplomatic hardship in US-Cuba relations. The influx of queer Cuban immigrants also transformed Miami’s social landscape and shaped a sense of gay cubanidad abroad. The Cuban Adjustment Act of 1966—commonly known as the wet foot, dry foot policy—facilitated the assimilation of Cubans into American society as it stipulated that any Cuban citizen who entered the United States could obtain residency after one year. The US-Cuban thaw of 2014 put an end to this policy, eliminating the possibility of documented Cuban migration into the United States. More recently, the decision announced on 16 June 2017 by the US president Donald Trump to roll back the US-Cuba policies adopted by the previous administration shows a stark intent to revive Cold War trade policies and sanctions on Cuba.

In general, migration crises in Latin America and the Caribbean are considered to be a phenomenon of globalization. In late 2015 approximately 6,000 Cuban citizens en
route to the US-Mexican border were left stranded in Costa Rica as a result of stringent immigration laws that restricted their free passage. This immigration crisis was further complicated by the end of the Cuban Adjustment Act of 1966, forcing Cubans, including sexual exiles, to find refuge in different countries throughout Latin America. Although the Cuban government has officially stopped persecuting sexual minorities, these groups continue to face social stigmatization and often choose exile.

“Sexile” and sexual migration from Latin America and the Caribbean should be understood as a complex process of migration in which socioeconomic, class, and racial factors, among others, constitute a tightly woven assemblage. It is undeniable, however, that the waves of LGBT migrants from Latin America and the Caribbean during the second half of the twentieth century have formed enclaves of queer latinidad (Rodríguez 2003) in North American city centers. Although many members of the LGBT community in Latin America and the Caribbean have fled their place of origin because of state persecution, social violence, family rejection, discrimination, and other forms of systemic oppression, others decide to remain in their home countries. “Sexile,” sexual migration, and choosing to stay may all function as viable forms of political resistance.

The Cuban Revolution was undoubtedly nationalistic from its onset and sought to alleviate and eradicate the social ills left behind by the Cuban republic: social inequality and extreme poverty, economic dependence on the United States, reliance on sugar plantations as the basis of a national economy, and governmental corruption, as well as social immorality (Bejel 2001). The accomplishments of the Cuban Revolution, however abrupt, included radical changes in the agricultural, educational, social welfare, and public health-care sectors. In terms of its gender and sexual politics, the Cuban Revolution embraced a heterosexual masculinist paradigm based on the principles of virility, violence, and patriarchy. To a degree, it inherited a set of presumptions about sexual practices and values that came from the region's historical, sociopolitical, and cultural transformations—mainly,
machismo, the family as the structural base of society, a set class and racial hierarchy, and an obsession with virginity (Hamilton 2012). In other words, homosexuality, gender fluidity, and sexual diversity—terms that are widely used today—along with homophobia, discrimination, and violence, coexisted prior to the advent of the Castro regime but acquired different connotations under the newly Sovietized socialist government.

**The Problem of Homosexuality to the Revolution**

Homosexuality during the onset of the Cuban Revolution was regarded as a moral threat to its masculinist project. The heroic teleology of progress, so avidly represented in the image of the virile guerrilla fighter, eschewed any alternative form of masculinity—let alone femininity. This vision of maleness was paradoxically homosocial and homophobic. As social constructs of a conflicted notion of masculinity, homosexuality and homophobia have been central forces in defining the sociopolitical and cultural characteristics of the Cuban fatherland—a national culture whose imaginary is lubricated by the heroism of icons such as José Martí (1853–1895) and Castro. Official historical accounts have privileged this type of subjectivity as the sole legitimate actor in the fight for liberation and social transformation. Cuban nationalism after 1959 also became a moral enterprise to extirpate all social imperfections from the past: the feminization of men and the masculinization of women (Sierra Madero 2006). The concept of “the new man” skillfully drafted as a new subjectivity by Ernesto “Che” Guevara (1928–1967), the Argentine Marxist revolutionary and Castro’s close associate, in *El socialismo y el hombre en Cuba* (1965; Socialism and man in Cuba) set the new parameters under which Cubans would measure their commitment to the structural and social reforms brought about by the revolution. But the solidification of a new social paradigm regarding gender and sexuality also sought to regulate, patrol, and correct the private practices of intimate everyday life. On the relationship between sexuality and social imagination in Cuba, the critic Emilio Bejel establishes that “this revolutionary Cuban subject ought to be free of the impurities of the bourgeois past, willing to sacrifice for his country, ready to renounce utilitarian values, and eager to possess a great disposition and aptitude for the struggle (a physical struggle, if need be) for nationalist and socialist ideals” (2001, 99).

Homosexuality became more explicitly politicized with the advent of the Cuban Revolution and was perceived as a form of ideological divergence—of political dissidence—that needed to be rehabilitated by socialist values of labor, sacrifice, and struggle for the sake of the nation’s welfare. The American journalist Lee Lockwood captured Castro’s sentiments about homosexuality during a taped interview in 1965. On the role of homosexuals within the new social order of the Cuban Revolution, Castro answered as follows:

*But above all, I do not believe that anybody has a definite answer as to what*
causes homosexuality. I think the problem must be studied very carefully. But I will be frank and say that homosexuals should not be allowed in positions where they are able to exert influence upon young people. In the conditions under which we live, because of the problems which our country is facing, we must inculcate our youth with the spirit of discipline, of struggle, of work.

(QUOTED IN YOUNG 1981, 8)

Castro’s view of homosexuality inspired some decisions to approach the study of sexuality from a pathological lens.

**FRESA Y CHOCOLATE (1993; TOMÁS GUTIÉRREZ ALEA AND JUAN CARLOS TABÍO)**

Before the 1993 film *Fresa y chocolate* (Strawberry and chocolate), representations of gay men in Cuban cinema were few and far between, and they almost always appeared as minor characters who provided comic relief by way of their exaggerated effeminacy. *Fresa y chocolate* changed that with its portrayal of Diego (Jorge Perugorría) as a positive and sympathetic homosexual male protagonist. Since then, representations of gay men and other sexual minorities in Cuban cinema have increased exponentially, although none—with the possible exception of *Santa y Andrés* (2016; directed by Carlos Lechuga)—has explored the intersection of homosexuality and politics under Fidel Castro (r. 1959–2008) or Raúl Castro (r. 2008–2018) as thoroughly as *Fresa y chocolate*.

The film tells the story of David (Vladimir Cruz), a politically and sexually inexperienced university student, and the relationship he develops with Diego, a victim of state persecution of homosexuals. Not coincidentally, the film is set in 1979, at the tail end of the Quinquenio Gris (literally, “Five Gray Years”), when many intellectuals, educators, and artists were persecuted for their unorthodox views on the Cuban Revolution, sexuality, and other matters of concern to the state. The 1971 Primer Congreso Nacional de Educación y Cultura (First National Congress on Education and Culture) is symptomatic in this regard; the declaration that came out of that congress set very strict limits as to what may be considered “revolutionary art” (i.e., art in support of Fidel Castro’s 1959 Cuban Revolution) and who may be considered a revolutionary artist:

*The cultural sectors shall not be used as a means of proliferation for false intellectuals who pretend to transform snobbism, extravagance, homosexuality, and other social aberrations into expressions of*
Against this backdrop, the film’s insistent references to a wide range of heterodox thinkers and artists, many of them homosexual, may be read as Diego’s attempt to recover a lost past of experimentalism and internationalism in the early 1960s, before Marxism-Leninism became the official doctrine of the state and, significantly, before the Unidades Militares de Ayuda a la Producción (UMAPs) forced labor camps were set up between 1965 and 1968 to “reform” conscientious objectors, political dissenters, and homosexuals—all of them considered equally counterrevolutionary at the time.

This political dimension of the film has been at the center of heated debates between those who consider the film state propaganda and those who see it as the work of dissident film directors. Take, for example, David’s characterization of singer-songwriter Pablo Milanés’s internment in the UMAP camps as a “mistake.” Diego responds by asking who will pay for those mistakes, and the matter ends with silence on David’s part. This brief exchange exemplifies a strategy that director Tomás Gutiérrez Alea used to similar effect in his 1968 Memorias del subdesarrollo (Memories of underdevelopment) of presenting viewers with confronting perspectives but leaving the conflict unresolved. For this reason, critics who dismiss the film as state propaganda are as partial as those who celebrate it as dissenting art. In fact, the film’s truth does not lie fully in either of these perspectives but rather in their confrontation, so that, ultimately, the more interesting question is what these different perspectives might reveal about the complex relationship between alternative sexualities and alternative politics in Cuba in the early 1990s, a time of profound political and economic crisis, known as the Special Period, that ushered in intense and critical debates on the future of the revolution. For example, the very production of Fresa y chocolate was facilitated by the Cuban Institute of Cinematographic Art and Industry's success in reversing the state’s censorship of Alicia en el pueblo de maravillas (1991; directed by Daniel Díaz Torres; Alice in Wondertown), a film with much more critical views on the state’s monopoly on knowledge and political expression. In the long term, however, Fresa y chocolate’s most important legacy is having effectively opened the door to LGBTQ-themed films throughout Latin America, by demonstrating that audiences were eager to support engaging films with psychologically complex characters, regardless of their sexuality.

**BIBLIOGRAPHY**
Despite his intention to understand the causes of homosexuality, his vision sought to identify, contain, analyze, and eradicate a “problem” that opposed the spirit of the revolution. To this end, homophobia was institutionalized.

Medical discourse was also aligned with the revolution’s pathological vision of homosexuality. In the journal Sexología: Divulgación científica y educación sexual (1936–1963; Sexology: Scientific dissemination and sexual education), Ángel Custodio Arce (c. 1963), the top sexologist during the early decades of the revolution, called on society to combat tolerance for homosexuals and prostitutes, while warning against the moral vices of a capitalist society. Moreover, by associating homosexuality with the perceived ideological decay of capitalism, the revolution inevitably framed practices of same-sex desire within the geopolitics of the Cold War. That is, homosexuality was seen as a practice of political dissidence and of capitalist excess. In that sense, acts of social repudiation and homophobia were necessary to combat the public enemies of Cuban socialism.

One of the first public displays of gay cleansing occurred in 1961 when a massive socialist raid against homosexuals took place in Havana. Known as Noche de las Tres Pes (Operation Three P’s)—for pederasts, prostitutes, and pimps—the operation was carried out as a xenophobic act to cleanse the streets of the capital city. These police raids set a precedent for the treatment of sexually diverse subjects under the Communist regime. Today, the fact that some transgender community members face police harassment and discrimination on a daily basis serves as a case in point.

**Creation of the UMAP Camps**

In line with a socialist agenda of bringing change through labor and productivity, Castro
and other military officials created the Unidades Militares de Ayuda a la Producción (UMAPs; Military Units to Aid Production) during the 1960s. These camps were created with the intention of tackling the moral conversion of social deviants, including homosexuals, prostitutes, hippies, rebel youth, religious zealots, intellectuals, priests, drug addicts, and any other outcasts who were seen as a “counterrevolutionary” threat to the Communist regime. The UMAPs were agricultural forced-labor concentration camps run by the Cuban army from November 1965 to July 1968 in the province of Camagüey, located on the east side of the island. Recruitment to the UMAPs came from denouncements by the secret police, neighbors, or Comités de Defensa de la Revolución (Committees for the Defense of the Revolution), whose main scope involved policing and monitoring the proper moral behavior of neighborhood groups according to socialist statutes.

An estimated 35,000 internees are believed to have performed forced labor in sugarcane plantation camps not only as a strategy for sexual reeducation through labor but also to remedy the labor shortage in agriculture, as well as to reduce the labor cost of military soldiers (Ponte 2014). In a 2012 interview, María Elena Solé Arrondo, a psychiatrist whose clinical work focused on the “rehabilitation” of homosexual interns at the UMAPs, suggests that these camps were also centers where psychological studies on the categorization of homosexual behavior were being conducted prior to their closure in July 1968 (Guerra and Sierra Madero 2016). Under the direct command of the Ministerio de las Fuerzas Armadas Revolucionarias (Ministry of the Revolutionary Armed Forces), Solé Arrondo was part of a clinical team in charge of identifying homosexuals based on an A1 to A4 scale, where A1 identified a subject with a very discreet homosexual tendency, and A4 a subject with an exuberant homosexual tendency. The study also sought to identify the causes of homosexuality and devise clinical treatments for their integration into the socialist way of life.

Impact on Culture

The new ideological and moral principles of the Cuban Revolution regarding homosexuality and sexual diversity not only permeated the sociopolitical spheres of the newly transformed society but steadfastly extended to the cultural and aesthetic fields. In a speech delivered to Cuban intellectuals in June 1961 at the Biblioteca Nacional (National Library), Castro also demarcated the margins of what revolutionary culture ought to be and the functions of the Cuban intellectual as a fighter for the revolution. “Esto significa que dentro de la Revolución todo; contra la Revolución, nada” (This means that within the revolution, everything; against the revolution, nothing), Castro infamously asserted, as many of the artists present at the time felt that their freedom to create was being truncated by the new social order. Many of the openly gay intellectuals were among the first ones to experience the discrimination, violence, and ostracism of the revolution. Central cultural figures, such as Virgilio Piñera (1912–1979), whose literary production incorporated issues
of corporeality and sexuality, and Antón Arrufat (1935–), whose theater pieces critiqued the new form of government, were rapidly dismissed from important roles in cultural institutions. José Lezama Lima's (1910–1976) novel Paradiso (1966; Paradise), which treated the topic of homoeroticism extensively in its eighth chapter, infuriated official cultural authorities. Other gay artists and intellectuals also fell prey to immediate internment in the UMAPs.

Post-UMAP Treatment of Homosexuals

The international denouncement of the Castro regime's treatment of intellectuals by prominent Latin American writers such as Mario Vargas Llosa, Julio Cortázar, and Carlos Fuentes, along with international pressures on the treatment of Cuban counterrevolutionaries, led to the subsequent dismantling of these concentration camps. But even after the closure of the UMAPs, discrimination against and persecution and ostracism of homosexuals in Cuba continued. Most notably, the unrelenting persecution of the writer Reinaldo Arenas is an example of the institutionalized homophobia that characterized the Castro regime even after 1968. Many decades later, in 2010, Castro assumed total responsibility for the marginalization of homosexuals in the UMAPs in an interview with the Mexican newspaper La Jornada. However, he never apologized to his constituents in any of his public speeches in Cuba.

It was not until 1979 that homosexuality was legally recognized, and in 2013 discrimination based on sexual orientation was made illegal in Cuba. The Centro Nacional de Educación Sexual (CENESEX; National Center for Sex Education), created in 1990 and now directed by Mariela Castro Espín (1962–; niece of Fidel Castro), celebrates on 17 May of each year La Jornada Cubana contra la Homofobia y la Transfobia (Cuban Day against Homophobia and Transphobia) as an institutional attempt to bring visibility to LGBT rights in Cuba. Although transgender rights constitute an integral part of CENESEX's political agenda, same-sex marriage legislation is nonexistent. The fight for LGBT rights and its implications for daily life in Cuba continue to carry sociopolitical, cultural, and historical contradictions. For instance, the creation of a transgender network, called TransCuba, does not ensure the daily survival of trans women, a very vulnerable population subjected to violence and discrimination based on gender expression, sexual orientation, and/or gender identity. Independent LGBT groups and grassroots organizations in Cuba that demonstrate an unwillingness to collaborate with CENESEX's political agenda are often scrutinized and delegitimized for their perceived dissidence, signaling that any social change can be mediated only through the official institutions of the revolution.

Ponte, Antonio José. “¿Qué fueron las UMAP?” [What was the UMAP?]. *Diario de Cuba*, 23 February 2014. [http://www.diariodecuba.com/cuba/1393116891_7285.html](http://www.diariodecuba.com/cuba/1393116891_7285.html)

The first federal court decision in favor of a constitutional claim to a birth certificate sex-designation change in the absence of a statute contemplating such changes.

In 1975 the Stonewall riots (1969) were still a recent memory and the notion of substantive LGBT antidiscrimination law was in its infancy. The modern era of US transgender law, however, was already two decades old—yet it was on a bifurcated trajectory. In 1955 the state of Illinois enacted legislation specifically contemplating the desire and need for a change of sex designation following transition. Arizona, Louisiana, Hawaii, Utah, and North Carolina followed suit (Taylor, Tadlock, and Poggio 2013–2014; Rose 2004; Utah 1975).

These statutes, as well as the treatment options available to those who would seek to use them, are products of an era that all but exclusively contemplated surgery-based transition, a reality reflected in the legal and community language of the time (Stryker 2008). Consequently, the term transsexual is more situationally proper for discussing the early statutes and cases than is the term transgender. Moreover, irrespective of the degree to which they may currently be used by individuals who eschew transsexual in favor of transgender or some other term of choice, the term transsexual birth certificate statute is commonly used to encompass laws that specify a legal procedure by which those who have undergone gender transition can conform their birth certificates to the reality of their post-transition lives (Rose 2009). That term is thus wholly appropriate for the Illinois statute and those enacted during the quarter-century thereafter.

The first six transsexual birth certificate statutes yielded no published decisional law to reinforce their clear textual meanings. In no small part, this was attributable to the very existence of the statutes themselves (Matambanadzo 2005). In the absence of a statute, the threshold question always was whether a court could even hear a request for a legal change of sex; litigation that produced negative answers to that question also produced several
published court opinions. With the existence of a statute mandating a positive answer to that question, the only remaining issue for a court was whether a petitioner met the standard(s) set out under the given state’s statute (e.g., providing acceptable proof of having undergone surgery or other statutorily sufficient medical procedures). Even this issue did not manage to make transsexual birth certificate statutes visible to the majority of legal practitioners. Not until the twenty-first century did an appellate court (in Illinois) address whether the requirements of a state sexchange statute had been met (Fletcher 2006).

The main challenge faced by transsexual persons arose in states that lacked a clear statutory requirement for birth certificate sex-designation changes; there, they faced legal hurdles of whether or not their requests were seen as legally cognizable—that is, whether their requests were even reviewable by courts under accepted legal principles. It is not clear when or where the first such birth certificate sex-change request was made, but during the 1960s some were successful (either administratively or judicially). These also resulted, however, in no published opinions that would establish legal precedent (Tierney and O’Brien 1968). Beginning in 1966, courts in jurisdictions without statutes did begin issuing published opinions on the issue. The most infamous and persuasive of these came from England in 1970 (Rose 1999–2000), although some of the more well-known US decisions came from trial courts in New York. These courts uniformly held against recognition of transition, although some did provide occasional support for name changes (Meyerowitz 2002; Rose 1999–2000).

Later in the decade, a Virginia court appears to have approved of a birth certificate change in the absence of a statute (Gaysweek 1978), but no published opinion accompanied the decision. Perhaps more importantly for trans people born in the state, Virginia did enact a birth certificate statute the following year (Rose 2004). In 1978 a Pennsylvania trial court also issued an opinion memorializing its favorable decision regarding a birth certificate change, but even as a court it could only request such from the petitioner’s state of birth, because the Indiana-born petitioner’s birth certificate was under control of that state’s authorities. In K v. Health Division (1977), however, the Oregon Supreme Court fell in line with the view that a statute was necessary for a request to be accepted. Although that trans-negative reasoning broke no new ground, it was the judgment of a state’s highest court. This was more representative of the legal landscape faced by Diana Darnell when she brought her case in a federal district court in Connecticut.

**Diana Darnell Takes Administrative and Judicial Action**

Diana Darnell underwent gender-confirmation surgery in New York in 1972. A native of New London, Connecticut, her path to transition may not have included the genderidentity clinic in that state’s capital; a Hartford (Connecticut) Courant feature noted that her then-ongoing case had no connection to the clinic (Lang 1975). But her path did cross the office
of Connecticut's commissioner of health, Franklin Foote. Darnell requested that Foote's agency change the sex designation on her birth certificate. Foote held an administrative hearing on the matter. Darnell was represented by counsel and presented evidence in support of her position. Foote denied her request, and Darnell appealed that decision to the New London County’s court of common pleas, a state court. However, she did not do so within the mandated time frame. Based on this procedural failing, the court of common pleas upheld Foote’s decision.

Darnell then looked to the federal court system for a remedy based on constitutional civil rights principles of equal protection. In the interim, Douglas Lloyd had taken over as commissioner of health. He asserted that the combination of Darnell’s administrative action and failed attempt to appeal to the court of common pleas amounted to res judicata, a final, substantive determination of Darnell’s legal rights that precluded any other court from again considering them. M. Joseph Blumenfeld, the federal district judge handling the case, rejected this position out of hand, pointing out that the only thing that established precedent required a plaintiff in Darnell’s position to do was to exhaust her administrative remedies before launching a civil rights action, which was precisely what she had already done.

Thus, the commissioner of health lost on his procedural argument. Still, Darnell was not able to claim a full victory. Blumenfeld expressed disdain for the relatively sparse legal arguments and factual support that each side in the case had brought to him. He characterized Darnell as having used “a ‘shotgun’ approach, predicking the wrongfulness of the Commissioner’s conduct on many different grounds” (Darnell v. Lloyd 1975, 1213). Lloyd’s total response to all the claims consisted of merely two pages, which Blumenfeld derided as “frivolous” (1213). However, Blumenfeld acknowledged that, at a minimum, one of Darnell’s theories constituted a valid legal cause of action and could prove successful if she was able to sufficiently demonstrate that she was female. In Blumenfeld’s view, the commissioner’s policy of granting some birth certificate changes on bases that were not listed under statute but not those that transsexual persons such as Darnell would seek implicated principles of equal protection. In suggesting the merits of Darnell’s equal protection claims, Blumenfeld noted that Darnell’s fundamental marriage rights “at least tangentially” supported her claims regarding her birth certificate sex-change request (1214).

No subsequent published opinion addressed Darnell’s case. In a 2000 case not involving transition, the Connecticut Supreme Court seemed eager to point out that Blumenfeld had found only that Darnell’s complaint had stated a cause of action and that he had not rendered a final judgment in her favor. The implication seems to be that, had a case similar to Darnell’s then been before the Connecticut high court, it might not have ruled in line with Blumenfeld. State statutory law soon thereafter embraced the notion of “gender change,” although the timing seems to have been coincidental (Connecticut 2001).
News reports subsequent to the 1975 ruling do indicate that Darnell did succeed in obtaining a birth certificate with a female sex designation. That process, however, was not simple for her. It was not until August of the following year that she and the state were able to reach a settlement. The state agreed to amend her birth certificate “by crossing out, not obliterating, the ‘male’ designation and writing in ‘female’ followed by asterisks.” The asterisks would lead to a footnote indicating that she had undergone surgical transition (Bridgeport [Connecticut] Telegram 1976, 42). Arguably, this achieved what she had been seeking: a birth certificate that would allow her to obtain a passport and marry a man, although in the modern era, this success would seem partial, at best.

An Era of Inconsistent Judicial Rulings on Trans Law

Victory in court was possible for individual trans persons during the 1970s. Consistency in court victories, however, was elusive—a problem not exclusive to the first post-Stonewall decade (Haider-Markel and Taylor 2016). With the exception of the door to federal Title VII antidiscrimination protections being firmly closed (Holt 1997), until the twenty-first century (Rose 2001), no overarching national rules emerged. A notable victory in one case in one jurisdiction typically would be tempered, or even fully offset, by losses on the same issue in other jurisdictions.

Courts in Minnesota, California, and Iowa ruled in favor of transsexuals seeking government funding for transition-related health care (Doe v. State, Dept. of Public Welfare [1977]; G.B. v. Lackner [1978]; J.D. v. Lackner [1978]; Pinneke v. Preisser [1980]), but a federal court in Georgia ruled contrarily (Witherspoon 1980). The Illinois Supreme Court partially nullified Chicago’s anti-crossdressing ordinance, in no small part because of the existence of the state’s transsexual birth certificate statute (City of Chicago v. Wilson [1978]), and a federal court relied on that decision to partially nullify Houston’s ordinance (Doe v. McConn [1980]), despite the lack of a Texas statute regarding gender changes on birth certificates. But a morass of conflicting decisions in Ohio led to no clear rule on such laws even within that state (City of Cincinnati v. Adams [1974]; City of Columbus v. Zanders [1974]; City of Columbus v. Zanders [1970]), and the US Supreme Court declined to take up the issue when presented with the opportunity to do so (Advocate 1974). In cases not directly implicating birth certificates, a New Jersey court recognized a transsexual woman’s postsurgical sex status for purposes of a marriage to a cis man (M.T. v. J.T. [1976]) but a New York court did not do similarly for a transsexual man’s marriage to a cis woman (B. v. B [1974]).

The birth certificate issue also saw no uniformity even in the realm of administrative interpretive law. In 1975 the attorney general of Massachusetts formally interpreted a non-trans-specific vital statistics framework in favor of transsexuals six years before the state enacted a statute (Bellotti 1975; Rose 2004). The corresponding offices in North Carolina and Florida, however, insisted on the necessity of a transsexual-specific statute (S. Smith
to find grounds for requiring state agencies to make requested gender changes on birth certificates. Though likely a coincidence, North Carolina did enact such a statute mere weeks after Blumenfeld’s *Darnell* opinion. Florida, however, has never enacted such a statute, with its lone published court decision being a hostile rejection of a birth certificate from another state lacking such statutory authority (*Kantaras v. Kantaras* [2004]).

**Minimal Influence of *Darnell v. Lloyd***

At the time of Blumenfeld’s published opinion, six states had transsexual birth certificate statutes. Iowa, California, Michigan, and Virginia (as well as the territory of Guam) had also enacted such statutes by the end of the decade (*Rose* 2004; Guam 1980). The following decade, generally regarded as one of civil rights retrenchment rather than advancement, saw Arkansas; Oregon; Massachusetts; Washington, DC; Georgia; Colorado; New Jersey; Missouri; and Wisconsin offer transsexual people a statutory avenue to transition recognition (*Rose* 2004). These states represent a range that fell outside of traditional geographical and political groupings as to LGBT-friendliness (*Taylor, Tadlock, and Poggione* 2013–2014).

During the last half of the 1970s and on through the 1980s, state recognition of transition grew substantially—via statute. The notable published legal decision of the 1980s came from a probate court judge who misgendered the trans woman petitioner even while offering the seemingly contradictory acknowledgment that he would abide by a transsexual birth certificate statute if his state had one (*In re Ladrach* [1987]). His state was Ohio, however, which did not have a relevant birth certificate gender-change statute.

The *Darnell v. Lloyd* decision stands out as a positive one in an era rife with, at best, inconsistent transgender legal rules. However, as the subsequent activity in *Darnell v. Lloyd* indicates, her victory was but a prelude to a compromise (*Bridgeport [Connecticut] Telegram* 1976; *Hartford [Connecticut] Courant* 1976). It also had very little impact on judicial decision-making in the ensuing four decades. Some commentators have made some effort, albeit not extensive (*Rosky 2013; Weiss 2001; Matambanadzo 2005*), to explore the contours of how transsexuals’ rights are “tangentially” negatively affected by birth certificate restrictions. More frequently one can find commentators, including unapologetically anti-LGBT ones (*Zakaria 2005*), simply pointing to Darnell having been able to avoid having summary judgment granted against her (*Madeira 2002; Brown 2001; Tobin 2006*). Others refer to the decision via what appears to be little more than obligatory or tangential citations (*Markowitz 2008; Barry et al. 2016; Strasser 2003*). Commentators adopting an activist posture criticize the jurists who wrote post-*Darnell* negative birth certificate decisions without even paying heed to Blumenfeld’s decision (*Rose 1999–2000; Frye and Rose 2003*).

Indeed, two of the more ferociously anti-recognition decisions completely ignored *Darnell*
(In re Ladrach [1987]; Littleton v. Prange [1999]). Even the single pro-recognition decision (In re Gardiner [2001]) that properly contextualized Darnell viewed it as being of less importance than the New Jersey decision (M.T. v. J.T.) that emerged in 1976 while Darnell was negotiating her compromise with Connecticut. And that pro-recognition decision was subsequently overruled by an anti-recognition one, an opinion that mentioned Darnell only via quotation of the decision it was overruling (In re Gardiner [2002]).

One is just as likely to see Darnell v. Lloyd deployed, either in judicial decision-making or in commentary, for the purely procedural question that Blumenfeld quickly brushed aside in 1975—namely, whether Darnell's interaction with the administrative arm of the state of Connecticut constituted res judicata, a full and complete determination of her rights. Soon after the Darnell decision was issued, it came into play when a New York attorney was told that a state administrative proceeding did foreclose his federal action (Hammer v. Town of Greenburgh [1977]) and when a Puerto Rican police officer claiming wrongful termination was able to go forward with some of his claims (Jimenez v. Toledo [1978]). Decades later, another police officer was able to do so as well, in part as a result of Blumenfeld having distinguished otherwise-controlling US Supreme Court precedent (United States v. Utah Construction & Mining Co. [1966]) so as to see a distinction between proceedings that are "judicial in nature" and those that are merely advisory (Eaton v. Siemens [2007]) for purposes of subsequent federal civil rights actions.

Understudied Role in Legal Academic Literature

Legal academic commentators have, perhaps, noticed this case more than the actual world of legal practice, although, again, the influence has been relatively less than might be expected for the pioneering aspects of the case. Twenty-one articles have cited the case in general discussions regarding transgender rights, and nine have discussed it with respect to Blumenfeld's statements regarding birth certificate sex changes and marriage rights. The closest Darnell v. Lloyd has come to having any substantive impact, however, has been in the esoteric universe of the interplay between administrative and constitutional law. In the four decades plus since Darnell was able to secure a birth certificate that reflected the reality of her post-transition life, she does appear to be the only transsexual person to have benefited directly from Blumenfeld's opinion.

In the realm of transgender legal history, Darnell v. Lloyd is an overlooked judicial positive during an era in which the courts sent mixed messages that many often misinterpret as a wholly negative reaction to transsexuality by the US legal system. That view discounts the slow, yet steady, stream of states enacting transsexual birth certificate statutes. Moreover, courts began to accept challenges to anti-cross-dressing laws, government unwillingness to fund transition-related health care, and state failure to recognize post-transition marriage. On all fronts there were indeed negative court decisions. However, except for employment discrimination, there also were positive ones. Transsexuals seeking recognition of change
of sex in state courts in the absence of a birth certificate statute triggered many of the negative decisions. However, Darnell’s legal resistance to Connecticut’s administrative law decisions led to a federal court issuing the most positive of the early transsexual birth certificate opinions.

Daughters of Bilitis

MARCIA M. GALLO
Associate Professor, Department of History
University of Nevada, Las Vegas

The first women's organization in the United States to directly address issues of female same-sex sexuality and gender.

The four lesbian couples who organized the Daughters of Bilitis (DOB) in the mid-twentieth century could not have imagined the variety of gay, lesbian, bisexual, transgender, and queer communities that would exist in the twenty-first century. Yet the DOB provides a vital link between yesterday and today. Founded in San Francisco in 1955, the Daughters of Bilitis was the first women’s organization in the United States to directly address issues of female same-sex sexuality and gender. It helped develop one of the most significant movements for social change: the gay and lesbian civil rights movement. Through its leadership in the predominantly male homophile (love of same) movement, the DOB provided first social and then political involvement. The group’s magazine (the Ladder), its network of local chapters, and its series of public conventions throughout the 1960s played crucial roles in creating lesbian identity, visibility, institutions, and political strategies. The members of the DOB were part of a tiny network of women and men in the post–World War II period that began to question their lack of basic civil rights because of their choice of sexual and romantic partners. As a result of their efforts, later movements for gender and sexual equality developed in the 1970s and beyond.

The DOB was created by a small and racially diverse group of working- and middle-class women, including Phyllis Lyon (1924–) and Del Martin (1921–2008), who wanted to find a space to socialize with other lesbians in San Francisco. The obscure name they chose for their new group—which referenced a book of lesbian erotica first printed in the late nineteenth century and reprinted in paperback in the early 1950s—reflected the cautiousness of the mid-1950s. This was a time when gay people were just beginning to identify themselves, organize groups, and advocate for civil rights despite severe social and political repression. By the early 1960s there were DOB chapters in New York, Los Angeles, and Chicago, and chapters were added in more cities in the 1970s. Throughout the organization’s history, DOB members engaged in regular discussions—in print and in person—about sex roles, gender conformity, gay marriage, and raising children, to name some of the issues they took up, issues that are still relevant in the twenty-first century. They used education, research, and lobbying to influence personal attitudes, institutional policies, and social practices regarding female homosexuality.
Phyllis Lyon (left) and Del Martin, Two of the Founders of the Daughters of Bilitis. Lyon, Martin, and other lesbians created the Daughters of Bilitis in 1955 as the first women’s organization in the United States to directly address issues of female same-sex sexuality and gender.

The Daughters often disagreed with one another about the best ways to achieve their goals, but the one thing that they all agreed on was the significance of providing safe spaces for lesbians. Whether they believed in social services or social change as the essence of the group, whether they were educators or organizers, athletes or intellectuals, former Daughters describe the DOB first and foremost as providing a meeting place for women.

They planned parties, picnics, potlucks, discussion groups, and public meetings with psychologists, sociologists, lawyers, and politicians—all nonthreatening ways to reach out to women who might want to join. They welcomed anyone who wanted to learn about “the problem of the female variant,” as they wrote in the statement of purpose printed in every issue of their magazine.

**The Ladder**

The Daughters of Bilitis is renowned for creating the first ongoing monthly magazine by and for lesbians, the *Ladder*, published from 1956 until 1972. It provided a means of communication, debate, and political education for women in the United States and internationally and promoted lesbian writers, artists, and activists. It also inspired the development of similar magazines. Envisioned as a recruitment tool when it began, the *Ladder* in its first few years was written almost entirely by DOB members, typed by
volunteers, and copied in secret at night at someone’s workplace, then assembled and mailed in plain brown envelopes to friends and potential allies. Despite its homemade appearance, it helped attract new members to the DOB. At the same time, it added an important female voice to the small, male-dominated homophile movement of the mid-1950s. During its sixteen years of continuous publication, the *Ladder* became a respected site of debate and analysis for the growing gay and lesbian movement while expanding contemporary attitudes about lesbians. It always reflected strongly pro-woman perspectives.

Working on the *Ladder* also provided a sense of purpose to the organization as a whole. The production and distribution of the magazine was the central activity of the Daughters and drew on the administrative skills of women in the DOB’s hometown of San Francisco, as well as in the group’s larger chapter cities. Starting in the mid-1960s, it also received regular $3,000 checks from a wealthy closeted supporter, which enabled the little magazine to be professionally typeset and printed. During its final years, from 1968 to 1972, the *Ladder* was used to promote the ideas of the emerging feminist movement and lesbian liberation.

The *Ladder* relied on the commitment of the five women editors who guided its development during its sixteen years: Phyllis Lyon (1956–1960), Del Martin (1960–1963), Barbara Gittings (1963–1966), Helen Sandoz (1966–1968), and Barbara Grier (1968–1972). Each one left her particular mark on the publication, expanding its scope and content, but all of them disseminated information, helped the DOB appeal for funds and volunteers, and reported on local and national developments in the lesbian and gay movement.

Today, both the content within its pages and the images on the cover provide researchers with tools to unearth the complexities of women’s organizing in the post–World War II period. The *Ladder* helps today’s readers understand that the 1950s was a complicated time not only of social conformity and political repression but also of nascent civil rights struggles that included gender and sexuality as well as race and economic status. While the dominant media images of white women in the post–World War II era may have emphasized domesticity, the reality of continuing female employment outside the home and the increase in women who were seeking college degrees meant that social norms were shifting toward gender equality. As the African American playwright and civil rights activist Lorraine Hansberry wrote to the *Ladder* in 1957, “I’m glad as heck that you exist…. Women, like other oppressed groups of one kind or another, have particularly had to pay a price for the intellectual impoverishment that the second class status imposed on us for centuries created and sustained. Thus, I feel that *The Ladder* is a fine, elementary step in a rewarding direction” (*Ladder*, May 1957, 26).

**National Conventions**
Starting in 1960 and continuing every two years for the next decade, the DOB organized the first and only large public gatherings of lesbian activists and their allies in the United States in that period. Their national conventions were an impressive feat for a tiny, all-volunteer group. Drawing anywhere from 100 to 300 women and men at each one, the DOB conventions were held twice each in San Francisco and New York, as well as in Los Angeles and Aurora, Colorado, near Denver. Each convention was held in a hotel in a central location and featured speeches, parties, and at least one gala event. Special awards, such as the “S.O.B. awards” (for “Sons of Bilitis”), were given to men who had been helpful to the DOB. National conventions also included a DOB business meeting, during which delegates from the chapters voted on national officers and policy changes. Voting lists of eligible members, proxies, and financial statements and reports were carefully created by the national governing board and the chapters for each gathering. In this way, the DOB consciously implemented democratic structures and practices into its organizational work.

Perhaps most importantly, the national conventions provided unprecedented opportunities to put the Daughters’ faces and voices before the public. As the 1960s progressed, and media interest in homosexuality increased, DOB activists and lesbians in general saw their visibility climb as they were “discovered” by talk-show hosts hungry for provocative and popular topics. To promote their conventions, the Daughters sent press releases and contacted the media in the host cities. Each of the conventions saw an increase in local coverage from the one before. For example, the DOB’s 1962 convention in Los Angeles resulted in television appearances by and numerous interviews with DOB members that were used as the basis for a best-selling 1964 nonfiction book, *The Grapevine*, by Jess Stearn. During the DOB convention in New York City in 1964, the *New York Times* sent a reporter to cover some of the sessions, leading to unprecedented publicity for the organization. Whenever any of the group’s members appeared in the media, the response was immediate, with women contacting them for information about the organization. The Daughters sharpened their abilities to be interviewed by newspaper reporters, radio hosts, and television personalities without being diminished or trivialized.

Their media appearances only increased as the decade went on. Many of the Daughters, such as Gittings, Lyon, and Martin, became regular guests on local, regional, and national talk shows. By then, however, Gittings was putting her considerable writing and speaking skills to work on behalf of the growing gay rights movement, while Lyon and Martin had moved on from the DOB to the National Organization for Women and other new groups promoting feminism. The growing militancy of both the gay and feminist movements in the late 1960s and early 1970s influenced the DOB in many ways, both positive and painful.

“If That’s All There Is …”

The Daughters of Bilitis officially disbanded as a national organization in 1970 after then-*Ladder* editor Barbara Grier and DOB president Rita Laporte took the magazine and its
mailing list away from the DOB and began to publish it independently. They claimed that they did so to devote the *Ladder* and its resources to the growing feminist movement. Many Daughters, including Lyon and Martin, felt that the action to take the magazine from the DOB amounted to a theft. However, among the first articles published in the new *Ladder* was Martin’s essay “If That’s All There Is,” which she used to document her break with the gay rights movement.

In August 1970, on the day of the first national Women’s Strike for Equality, Martin and other DOB members were joined by two new gay women’s groups as they confronted the closing session of the North American Conference of Homophile Organizations (NACHO). NACHO delegates had passed a resolution in support of women’s liberation but also stated their criticism of women-only groups. Martin was furious that the NACHO “would not address themselves to the underlying reason for the existence of separate women’s organizations—that the female homosexual faces sex discrimination not only in the heterosexual world, but within the homophile community.” In her essay Martin condemned the “male chauvinists of the homophile movement”; the “co-ed organizations” where “women are invisible”; the “defense of washroom sex and pornographic movies”; the “gay bars that discriminate against women”; and the “bastions of male privilege,” including “male evangelists from two disparate worlds” (*Ladder*, December/January 1970–1971, 4–6). Her powerful exposure of sexism within the gay rights movement was an unmistakable call to action for many lesbians.

In the early 1970s some lesbians answered the call and used the DOB and the *Ladder* as sites for organizing lesbian feminist activism. Younger leaders such as Jeanne Córdova in Los Angeles, Nina Kaiser in San Francisco, and Martha Shelley in New York saw the potential that the organization’s resources, including its network of members and its well-regarded magazine, provided, and they used them effectively. In addition, a number of new DOB groups began and thrived for short periods, most of them in large or medium-sized cities. In 1969, which is the same year as the Stonewall riots in New York City that supposedly “started” the gay rights revolution, a DOB chapter was founded in Melbourne as the first openly gay organization in Australia. DOB Boston also was started in 1969 and outlasted all other DOB groups; it remained active until 1995. During a time of personal and political upheavals, the aim of the members of DOB Boston was to provide a safe, social space for lesbians. In this way they brought the Daughters of Bilitis full circle: from its first group to its last, the DOB relied on social and educational events to bring women together.

The vision and commitment of the DOB provided a framework for lesbian organizing and publishing from 1955 on. Through conscious use of media and publicity and strategic collaborations with both gay male allies and heterosexual women and men, the Daughters of Bilitis provided an alternative universe of possibilities for lesbians where none previously had existed.

Defense of Marriage Act (1996)

AUSTIN C. EKLUND
PhD candidate
University at Albany, State University of New York

The passing and overturning of the US federal law essentially banning same-sex marriage.

H.R. 3396, commonly known as the Defense of Marriage Act (DOMA), was a 1996 bill pertaining to same-sex marriage passed by the 104th US Congress. It was signed into law by President Bill Clinton in the same year. The law was divided into three sections. The first section amended the federal judicial code to provide that no state or territory of the United States that did not permit same-sex marriages would be required to legally acknowledge or enforce same-sex marriages that took place in other parts of the United States that did permit same-sex marriages. The second section of the law established federal definitions of “marriage” as a legal union between one man and one woman as husband and wife and “spouse” as only a person of the opposite sex who is a husband or wife. The third section of the law absolved the federal government of responsibility to recognize any marriages between same-sex partners for the purposes of federal laws or programs, irrespective of the validity of those marriages in the couples' home states. In effect, the Defense of Marriage Act blocked same-sex married couples from federal rights, privileges, and protections afforded by default to all heterosexual married couples.

Origins

In 1996 the executive branch of the US federal government was helmed by President Bill Clinton (in office 1993–2001), a Democrat, while the legislative branch, including the US Congress, was overwhelmingly Republican. The Defense of Marriage Act was initially introduced by Republican representative Bob Barr of Georgia in May 1996. The bill passed the House of Representatives by a vote of 342–67. Republicans in the House supported it by a margin of 224–1, while Democrats backed it by a margin of 118–65. A similar landslide occurred in the Senate, where the 85–14 total vote saw all fifty-three Republicans voting for it and Democrats voting for it by a margin of 32–14. At the time, both houses of Congress were controlled by Republicans, and the majority of “yes” votes was significant enough to override a possible presidential veto. President Clinton signed the bill into law on 21 September 1996.
Republican Representative Bob Barr of Georgia. Barr initially introduced the bill that would become the Defense of Marriage Act in 1996.

From the time of the introduction of the Defense of Marriage Act, its constitutionality has been fiercely debated by legal experts and politicians. Traditionally, marriage and family law in the United States had been the exclusive province of the states. The “full faith and credit” clause of the US Constitution (Article IV, Section 1) was of special interest to both critics and supporters of the law, as the clause requires all states to respect the “public acts, records, and judicial proceedings of every other state,” including for domestic and family-related matters. During the significant civil rights changes of the mid-twentieth century, this clause of the Constitution had not been cited to force states with antimiscegenation laws to recognize interracial marriages, but it was then unclear whether or not the clause would be applied with respect to same-sex marriages.

**Social Context and Legal Precedent**

Discussions about extending civil rights to gay and lesbian Americans long predated the 1990s, when the Defense of Marriage Act was signed. In 1969 the gay rights movement was symbolically “born” when police conducted a routine raid of a gay bar called the Stonewall Inn in New York City. Bar patrons (including Marsha P. Johnson, a trans woman of color
credited with throwing the “first brick”) were frustrated by the persistent harassment and assault they experienced at the hands of law enforcement and so fought back during this raid in what became known as the Stonewall riots. Emboldened by this event and by the national visibility of gay communities that followed, a spate of similar events occurred at gay spaces in other cities nationwide: members of queer communities publicly and proudly pushed back against harassment and violence with demonstrations, protests, and lawsuits, in addition to organizing politically.

The following year, in 1970, Jack Baker and Michael McConnell of Minnesota became the first same-sex couple in the United States to apply for a marriage license. Hennepin County rejected their application, and the couple sued the state in *Baker v. Nelson* (1971), claiming a constitutional right to marriage. The Minnesota Supreme Court ruled that its state law limiting marriage to persons of the opposite sex did not violate the US Constitution. Baker appealed the decision, but the US Supreme Court dismissed the appeal “for want of a substantial federal question,” a rationale generally used to describe a legal challenge that does not impress the justices as sufficiently legally significant to warrant a full review. Because the case was not granted certiorari, and instead came to the US Supreme Court under a mandatory appellate review, its dismissal constituted a decision on the merits and established *Baker* as precedent nationwide. Still, several states, including Maryland, Virginia, and Florida, subsequently passed statutes that specifically excluded same-sex couples from marriage.

A national discussion about same-sex unions in the United States came to the fore in the 1980s, when the AIDS crisis killed tens of thousands of gay men, inviting questions about inheritance and death benefits for unmarried couples. The AIDS crisis is also credited with changing public perceptions of gay Americans, many of whom were galvanized by the crisis into coming out and organizing politically. For example, in September 1989, the influential State Bar Association of California urged recognition of marriages between same-sex couples, citing “fundamental fairness” and recommending a change in the California civil code to define marriage as a “personal relation arising out of a civil contract between two people.” This suggestion was ultimately symbolic, as the state’s conservative Board of Governors did not accept it, and same-sex marriage remained illegal in California through the end of the twentieth century.

The first legally significant victory for same-sex marriage activists came in 1993 in the Hawaii case of *Baehr v. Miike* (1993), when three same-sex couples sued the state of Hawaii after being denied a marriage license on the grounds that they were in same-sex relationships. The Hawaii Supreme Court ruled that the state’s prohibition of same-sex marriage violated the equal protection clause of the Hawaii Constitution because it discriminated on the basis of sex. The court remanded the case to trial, requiring that Hawaii prove a compelling government interest in prohibiting same-sex marriages. The plaintiffs won their case in 1996, when it was determined that Hawaii did not prove
sufficient interest in maintaining the prohibition. Shortly thereafter, the Hawaii legislature enacted a statute that exclusively defined marriage as a union between heterosexual couples; simultaneously, the state created the Commission on Sexual Orientation and the Law to study the issue of granting certain benefits to same-sex couples. In 1997 Hawaii became the first US state to establish a registry for domestic partnerships (called “reciprocal beneficiaries”) that extended some of the same rights of married couples to unmarried couples. However, in 1998, Hawaii voters passed a constitutional amendment barring same-sex couples from the institution of marriage, which overrode the finding in *Baehr*.

*Baehr* was the first occasion on which a state supreme court ruled that same-sex couples may be entitled to marriage rights. Although its original legal determination applied only to the state of Hawaii, across the country the ruling energized people who supported same-sex marriage and discouraged those who opposed it. Both groups wondered if, under the application of the full faith and credit clause of the US Constitution, other states would be forced to recognize same-sex marriages performed in Hawaii, creating a possible snowball effect. Thus, if Hawaii had begun to recognize same-sex marriages as legal, other states might have been forced to follow suit.

**President Clinton and the Defense of Marriage Act**

President Clinton’s response to the Defense of Marriage Act has been the subject of widespread discussion and debate. He signed the bill into law in 1996 after a long day of campaigning for reelection against Republican opponent and then-Senate majority leader Bob Dole. Social conservatives were prone to oppose same-sex marriage and tended to vote for Republican candidates by significant margins, and the Republican platform at that time included vehement opposition to the extension of marriage rights to same-sex couples.

During his first election bid in 1992, Clinton had been more transparent and more aggressive in seeking votes from an increasingly organized gay political caucus than any presidential candidate in history. At that time, Republicans had controlled the White House for twelve years, and significant criticism had been leveled against the administrations of Ronald Reagan (1981–1989) and George H. W. Bush (1989–1993) for their neglect in funding the battle against AIDS, which disproportionately affected gay men. While governor of Arkansas, Clinton spoke at the first major presidential campaign event for gay and lesbian supporters in West Hollywood, California, delivering a stump speech focused heavily on the AIDS crisis and the moral responsibility he saw to address it. “I have a vision and you’re a part of it,” he told the crowd of mostly gay and lesbian attendees. “I believe we’re all a part of the same community and we’d better start behaving as if we are” (quoted in SoCarides 2013). In his second term, Clinton became the first president to officially address the Human Rights Campaign, an organization devoted to equal rights for LGBT Americans, and he also nominated James Hormel as the first openly gay ambassador in US
history.

However, some LGBT activists have argued that President Clinton’s “positive” relationship with gay and lesbian communities was inconsistent. In 1993 President Clinton announced a policy that would tolerate “homosexuals” in the military only if they remained silent about their identities, or “closeted,” and stayed sexually inactive while serving. Commonly referred to as “Don’t Ask, Don’t Tell,” but originally termed “Don’t Ask, Don’t Tell, Don’t Pursue,” the rule was designed to halt the removal of service members from duty based solely on their sexual orientation. While purportedly a measure to stop the indiscriminate firing of gay people from the military, the policy was viewed by many supporters of gay rights as an insufficient Compromise, even as the president was faced with a Congress that was overwhelmingly against affording civil rights to gay people inside or outside the armed forces. Raising further ire, following his signing of the Defense of Marriage Act, Clinton’s reelection campaign broadcast ads on Christian radio stations in fifteen states boasting about it. Following a swift backlash, the radio ad was pulled.

Still, Clinton’s presidency is regarded as theretofore the most supportive of LGBT equality in history. Nevertheless, throughout his reelection campaign in 1996, he repeatedly stated that he defined marriage as a union of one man and one woman. In the year of its signing, White House press secretary Mike McCurry called the Defense of Marriage Act “gay baiting, pure and simple,” and Clinton himself stated that the bill was “unnecessary” and “divisive” (quoted in Socarides 2013). One day before signing the bill into law, President Clinton released a statement:

> Throughout my life I have strenuously opposed discrimination of any kind, including discrimination against gay and lesbian Americans.... I have long opposed governmental recognition of samegender marriages and this legislation is consistent with that position.... I also want to make clear to all that the enactment of this legislation should not, despite the fierce and at times divisive rhetoric surrounding it, be understood to provide an excuse for discrimination, violence or intimidation against any person on the basis of sexual orientation.

*(CLINTON 1996)*

Unlike many other bills President Clinton signed, there were no cameras present for the Defense of Marriage Act’s signing, and no ceremony was conducted.

Thirteen years later, in 2009, President Clinton publicly endorsed same-sex marriage for
the first time. In an interview with CNN's Anderson Cooper, Clinton stated: “I realized that I was over sixty years old, I grew up at a different time, and I was hung up about the word. I had all these gay friends, I had all these gay couple friends, and I was hung up about it. And I decided I was wrong.... I had an untenable position” (quoted in Socarides 2013).

**President George W. Bush and Same-Sex Marriage**

In 2004, consistent with views shared by the majority of elected officials in his party, Republican president George W. Bush (2001–2009) expressed support for a constitutional amendment banning gay marriage in order to “protect” marriage between a man and a woman, which he called “the most fundamental institution of civilization” (quoted in Stout 2004). He urged Congress to act on the amendment quickly, stating that a swift response would preempt action from “activist judges” seeking to redefine marriage in the United States by means of the full faith and credit clause of the Constitution. “Those who want to change the meaning of marriage will claim that this provision requires all states and cities to recognize same-sex marriages performed anywhere in America,” the president said (PBS NewsHour 2004).

In 2003 Massachusetts became the first US state to allow same-sex marriage after its supreme court ruled that the state’s ban violated the constitutional rights of same-sex couples. In 2004, like President Clinton at the time of the Defense of Marriage Act’s signing, Bush was running for reelection. His Democratic opponent, then-senator John Kerry of Massachusetts, publicly opposed gay marriage but also opposed Bush’s proposed amendment to the Constitution. Kerry was also publicly regarded as flexible on issues pertaining to gays and lesbians because his state was the first in the United States to grant marriage rights to same-sex couples.
DOMA Plaintiff Edith "Edie" Windsor in 2013. In 2010 Windsor challenged the US government’s unwillingness to recognize her same-sex marriage under the Defense of Marriage Act (DOMA) in its taxation of her late wife’s estate. Her lawsuit resulted in the US Supreme Court striking down DOMA in 2013 because it deprived same-sex couples their rights under the Fourteenth Amendment of the US Constitution.

The Legal Challenge to the Defense of Marriage Act

In 2013 the US Supreme Court was finally tasked with determining the constitutionality of the Defense of Marriage Act. Edith “Edie” Windsor and Thea Spyer were a lesbian couple who, after forty years together, were married in Canada in 2007. Two years later, Spyer died from complications associated with multiple sclerosis. Even though their marriage was recognized in the state of New York, where they had residency, Windsor, as the sole executor of her wife’s estate, was taxed on the inheritance by the federal government as if she and Spyer were unmarried at the time of Spyer’s death. Under federal law, a spouse who dies can leave assets to the other spouse without incurring taxes on the estate; because of section three of the Defense of Marriage Act, Windsor and Spyer’s same-sex marriage went unrecognized by the federal government, leaving Windsor with a tax debt of over $363,000.

In 2010 Windsor sued the federal government seeking a refund of the estate tax she was forced to pay. Windsor’s lawsuit made national news and received the enthusiastic support of the American Civil Liberties Union and the New York Civil Liberties Union, two activist organizations that challenge what they characterize as unnecessary government
interference in the lives of citizens. In part, Windsor’s lawsuit alleged that section three of the Defense of Marriage Act violated the equal protection clause of the Fourteenth Amendment to the US Constitution which guarantees equal rights to all US citizens. The lawsuit also described “differential treatment” for same-sex couples “compared to other similarly situated couples [as] without justification” (quoted in Reilly 2017).

**Nullification of the Defense of Marriage Act**

In 2011 US attorney general Eric Holder announced that the Department of Justice would not defend the constitutionality of section three of the Defense of Marriage Act. Holder stated that he and President Barack Obama (in office 2009–2017) concluded that classifications based on sexual orientation, like those based on race and gender, warranted strict legal scrutiny to ensure the absence of unfair discrimination, adding that section three of the Defense of Marriage Act was “unconstitutional.” President Obama was running for reelection the following year and, like his two predecessors, his position on gay and lesbian issues became a means of distinguishing himself from his opponent, Republican senator John McCain of Arizona.

Throughout his first campaign and first term in office, Obama had been more clearly and openly supportive of civil rights for LGBT people than any other president. For example, in 2008 Obama pledged to repeal the Defense of Marriage Act. In 2009 he signed the Matthew Shepard and James Byrd Jr. Act, which offered the Justice Department jurisdiction over violent crimes in which a victim has been selected because of sexual orientation, among other demographic characteristics. In 2010 he signed a bill repealing the “Don’t Ask, Don’t Tell” policy.

Theretofore, President Obama had repeatedly and publicly stated that he supported civil unions and other nonmarital partnerships for same-sex couples, some of which afforded them similar rights as full-fledged marriage. In 2012, the year of his reelection campaign, he became the first sitting president to express support for same-sex marriage. Obama subsequently won reelection by handy margins.

In 2013, in a reversal described as highly unusual, the former president Clinton penned an editorial in the *Washington Post* in which he publicly called the Defense of Marriage Act “discriminatory” and unconstitutional and urged the US Supreme Court, at that time tasked with determining its constitutionality, to overturn it. He stated:

> We are still a young country, and many of our landmark civil rights decisions are fresh enough that the voices of their champions still echo, even as the world that preceded them becomes less and less familiar. We have yet to celebrate the centennial of the 19th Amendment, but a society that denied women the vote
would seem to us now not unusual or old-fashioned but alien. I believe that in 2013 DOMA and opposition to marriage equality are vestiges of just such an unfamiliar society.

(CLINTON 2013)

In a five–four decision by the US Supreme Court, Edie Windsor won her case against the federal government, and section three of the Defense of Marriage Act was deemed unconstitutional, based on the ruling that it deprived same-sex couples of their rights under the Fourteenth Amendment to the US Constitution. The court also held that states, not the federal government, have the authority to define marital relationships, and that the federal government's interference in marriage defied legislative and historical precedent. The majority opinion in the *Windsor* case was written by Justice Anthony Kennedy, widely regarded as the US Supreme Court's “swing vote,” and was joined by Justices Ruth Bader Ginsburg, Stephen Breyer, Sonia Sotomayor, and Elena Kagan. Along ideological lines, Chief Justice John Roberts and Justices Antonin Scalia, Clarence Thomas, and Samuel Alito dissented. From the majority opinion:

*The class to which DOMA directs its restrictions and restraints are those persons who are joined in same-sex marriages made lawful by the State. DOMA singles out a class of persons deemed by a State entitled to recognition and protection to enhance their own liberty. It imposes a disability on the class by refusing to acknowledge a status the State finds to be dignified and proper. DOMA instructs all federal officials, and indeed all persons with whom same-sex couples interact, including their own children, that their marriage is less worthy than the marriages of others. The federal statute is invalid, for no legitimate purpose overcomes the purpose and effect to disparage and to injure those whom the State, by its marriage laws, sought to protect in personhood and dignity.*

(UNITED STATES V. WINDSOR 2013)

**Subsequent Marriage Ruling**

Still, striking down the Defense of Marriage Act did not fully extend marriage rights to same-sex couples across the country. Gay marriage was legalized nationwide two years later in *Obergefell v. Hodges* (2015), when groups of same-sex couples sued their respective state agencies in Michigan, Kentucky, Tennessee, and Ohio and challenged the
constitutionality of their states’ bans on same-sex marriage, or their states’ failure to recognize the legality of same-sex marriages conducted in other states. The plaintiffs claimed that, similar to the charges of Windsor’s lawsuit over the Defense of Marriage Act, their rights under the Fourteenth Amendment to the US Constitution were violated by disparate treatment on the basis of sex.

The US Supreme Court, in another five–four decision, ruled in the plaintiffs’ favor, arguing that the due process clause of the Fourteenth Amendment guarantees same-sex couples the right to marry. Judicial precedent has held that marriage is a fundamental liberty because it pertains to individual autonomy, protects an intimate association between two people, safeguards children and families, and is a cornerstone of social and cultural order. Like Windsor, the majority opinion in Obergefell was written by Justice Kennedy and joined by Justices Ginsburg, Breyer, Sotomayor, and Kagan. Chief Justice Roberts and Justices Scalia, Thomas, and Alito again dissented. From the majority opinion:

**The class to which DOMA directs its restrictions and restraints are those persons who are joined in same-sex marriages made lawful by the State. DOMA singles out a class of persons deemed by a State entitled to recognition and protection to enhance their own liberty. It imposes a disability on the class by refusing to acknowledge a status the State finds to be dignified and proper. DOMA instructs all federal officials, and indeed all persons with whom same-sex couples interact, including their own children, that their marriage is less worthy than the marriages of others. The federal statute is invalid, for no legitimate purpose overcomes the purpose and effect to disparage and to injure those whom the State, by its marriage laws, sought to protect in personhood and dignity.**

*(UNITED STATES V. WINDSOR 2013)*

Since the decisions in Windsor and Obergefell, hundreds of thousands of same-sex marriages have been conducted nationwide.

Reilly, Mollie. “Edith Windsor, Plaintiff in Landmark Same-Sex Marriage Case, Dies.” *Huffington Post*, 12 September 2017. [https://www.huffingtonpost.com/entry/edith-windsor-dead_us_59b83981e4b02da0e13d0ea](https://www.huffingtonpost.com/entry/edith-windsor-dead_us_59b83981e4b02da0e13d0ea)

The Diagnostic and Statistical Manual of Mental Disorders (DSM), published by the American Psychiatric Association (APA), presents a classification of recognized mental disorders. It is used in the United States as a diagnostic tool by clinicians and affects the insurance and pharmaceutical industries, because insurance companies will refer to its diagnostic schema when making decisions about which claims for treatment they will cover. Even though the International Classification of Diseases (ICD) is designed for international use, as the name would suggest, while the DSM is primarily intended for domestic US use, the DSM also has considerable global influence (Clark et al. 2017). For example, many parts of the world rely on the DSM to diagnose mental illness and to classify and track “epidemics” of poor mental health (Stein, Lund, and Nesse 2013), even though the deep divergence in acceptable cultural norms of behavior found in different parts of the world renders the idea of a universal psychiatry problematic (Landman 2013). In particular, the inclusion of sexuality- and gender-related conditions as mental disorders in the DSM has been the subject of long-standing controversy, often opposed by some critically minded medical doctors and psychiatrists, such as Charles Moser; by academics working in gender and sexuality studies from humanities and social sciences perspectives; and by LGBTQI+ activists, who see these as matters of identity rather than illness.

The different editions of the DSM (to date, five main editions, two followed by “revised” versions, and spanning more than half a century from 1952 to 2013) have, to some degree, reflected the changing Western social and cultural attitudes toward sexual practice, orientation, and gender identity throughout the twentieth and twenty-first centuries in their formulations of sexuality and gender-related diagnoses (Perone 2014). Homosexuality was “diagnosed” as a pathology in 1952, but all mentions of it were entirely removed by 1987. The “paraphilias” (the preferred APA term for “perversions” after DSM-II) were depathologized in 2013, such that only “paraphilic disorders,” where the unusual sexual stimulus is a source of “dysphoria” (emotional/psychological discomfort), remained as mental disorders in DSM-5 (Downing 2015). Along similar lines, “transsexualism,” which
appeared in *DSM-III* (1980), was removed in *DSM-5* (2013), such that only “gender dysphoria” remains, although this diagnosis is often a requirement for trans people to access therapies and surgeries in the United States and elsewhere. And, whereas *DSM-IV* included “interpersonal distress” as a proper cause for diagnosing hypoactive sexual desire disorder (i.e., the possibility that a husband who was unhappy with his wife’s lower libido could lead to that wife officially being classified as mentally ill), by the time of the publication of *DSM-5*, only dysphoria felt by the person with the disorder of sexual desire would qualify them for the diagnosis. The pattern that emerges, then, is a move from deviations from the norm—what Gayle S. Rubin terms instances of “benign variation” (1984)—being perceived as a problem for others and for society at large, and concomitantly pathologized, toward these variations falling within the definition of a mental disorder only if they cause distress to the person in question. The case of intersex conditions, however, is perhaps an exception to this broad trend, as many see the renaming of “intersex” as “disorders of sex development” in *DSM-5* as an intensification of the pathologization of intersexed people.

The broad parallel trajectories of destigmatization of a phenomenon in Western society at large and depathologization of it in the history of the *DSM* points up the degree to which political ideology and cultural taste intersect with and influence medical science. It confirms the perspectives of historians such as Ian Hacking, who argue, after the influential French historian and philosopher Michel Foucault (1926–1984), that diagnoses are culturally and historically contingent tools for establishing and policing regulatory norms of behavior and that shifts in diagnostic categories therefore map onto and reveal broader shifts in cultural attitudes (*Hacking 2006*).

**Homosexuality and Its Vicissitudes**

The sexuality diagnoses (homosexuality and “sexual deviations” or “perversions”) in the first (1952) edition of the *DSM* were heavily influenced by American psychoanalysts. However, unlike the founder of psychoanalysis, Sigmund Freud (1856–1939), who argued for the existence of universal primary bisexuality, such that homosexuals were seen to be suffering from “arrested development” but not from mental illness or moral degeneracy, the APA’s version of psychoanalytic thought, influenced by Sandor Rado (1890–1972), a Hungarian émigré to the United States, understood homosexuality as a pathology and more specifically as the “‘phobic’ avoidance of the other sex” (*Drescher 2015, 569*). In *DSM-I*, then, homosexuality appears as a “sociopathic personality disturbance,” whereas, by 1968, with the publication of *DSM-II*, it had been reclassified as one of the “sexual deviations” or perversions. In later years, however, psychiatry would branch off from psychoanalytic concepts and thinking and would move also toward a more nuanced understanding of sexuality. The controversial work of Alfred C. Kinsey (1894–1956) in the 1950s was crucial in contributing a qualitative understanding of the “spectrum” of sexuality and pushing
psychiatrists—however suspicious many of them were of Kinsey’s methods and findings—to reevaluate their understanding of homosexuality (Chiang 2008). This was further underpinned by the pioneering insights of the psychologist Evelyn Hooker (1907–1996), whose work led to the weakening of the assumed link between homosexuality and mental illness. The influence of nonconformist scientists and doctors, alongside activist groups, cannot be overstated in understanding the changes that would occur.

In the early 1970s, with the Stonewall riots having marked the turn of the decade in 1969, psychiatric circles held discussions regarding the appropriateness of continuing to consider homosexuality as a mental disorder at all (Martos, Wilson, and Meyer 2017; Kunzel 2017). Lesbian and gay activists disrupted the APA’s annual meetings in both 1970 and 1971, identifying the continued pathologization of homosexuality as a major contributing factor in negative social attitudes toward lesbians and gay men (Stoller et al. 1973). In 1972 John Fryer, a gay psychiatrist, joined activists at the annual meeting, appearing anonymously to talk about the difficulties of being a homosexual psychiatrist and the stigma and silence of those like him (Drescher 2015). A symposium was held at the 1973 APA annual meeting to debate the question: “Should homosexuality be in the APA nomenclature?” This followed research led by Robert Spitzer, who questioned whether conditions that did not cause distress to those presenting with them should still be considered mental disorders. He concluded that absence of dysphoria was a reasonable criterion for removal of a condition from the DSM and that homosexuality was, for the most part, such a condition. After evaluating the evidence of Spitzer’s group, along with other evidence presented, the APA members voted by a small majority to remove the diagnosis of homosexuality from the DSM.

However, DSM-II would contain a new diagnosis, “sexual orientation disturbance,” which would transform into “ego-dystonic homosexuality” in DSM-III (1980). These diagnoses considered persons to be suffering from a mental illness as a result of their homosexuality only if their orientation caused them significant distress. These caveat diagnoses were entirely dropped from DSM-III-R (1987). This decision was eminently reasonable because many would argue that, although somewhat destigmatized by 1980 in the West, continuing social oppression of, and prejudice against, gay and bisexual people may reasonably account for their feeling unhappy, without their sexuality itself being a factor in causing mental ill health. Yet, despite the APA’s eventual acceptance of the possibility of healthy homosexuality, in the American psychoanalytic community the tendency to pathologize nonheterosexual sexuality did not disappear, and many lamented its removal from the DSM. Writing as late as 1995, the socially conservative psychoanalyst Charles W. Socarides dubbed homosexuality “a freedom too far” in his politically reactionary account of the impact of gay liberation on American society (Socarides 1995).

Transforming the Trans Diagnoses
Understandings of gender identities and sexual orientations are not easily separated from each other in the medicolegal history of sexuality. For Karl Heinrich Ulrichs (1825–1895), a German lawyer and early gay rights activist whose theory of homosexuality was very influential in the 1840s and 1850s, an “Uning” (the name Ulrichs gave to a homosexual) was a person with the soul of one sex trapped in the body of another, thereby creating a very heterosexual logic for homosexual desire. This also describes one understanding, and one narrative, of “transsexuality” that held sway in the twentieth century—that of the dysphoria experienced by a person “born in the wrong body.” More recent understandings of trans identities among some trans activists and LGBTQI+ communities, however, reject the notion of dysphoria being a necessary factor in trans experience, and the medical establishment has moved gradually in the direction of depathologization. Yet, in certain cultural and historical contexts where homophobia is prevalent, the “trans-ing” of individuals offers an effective way of suppressing homosexuality and enforcing normative gender roles. In Iran in the twenty-first century, homosexuality is prohibited by the theocratic state, but the country hosts more sex reassignment surgeries (i.e., gender confirmation surgery) than any nation besides Thailand (Drescher 2010a). This situation leads some, including trans women and men themselves, to see homosexuality as a “willed deviation” and may encourage gender-nonconforming people to identify as trans (Najmabadi 2014, 250). In the 1950s and 1960s in the United States, medical experts such as the psychiatrist Richard Green (1936–) were concerned that patients presenting with transsexualism were “really” homosexuals. In order to be allowed access to sex reassignment surgery, a trans person was expected to express disgust at the idea of homosexual sex and to declare an entire absence of sexual desire (Valentine 2007). Both homophobia and a lack of respect for trans people and their experience as fully desiring human beings, then, permeate and shape the history of trans diagnoses.

In the case of the DSM, “transsexualism” and “gender identity disorder of childhood” were first included in DSM-III (1980), in large part in response to the influential work of the sexologists and psychiatrists John Money (1921–2006), Harry Benjamin (1885–1986), Robert J. Stoller (1924–1991), and Green, who set up gender clinics in the United States, where, between the 1950s and 1980s, they provided therapeutic and surgical treatment for those presenting with gender-nonconforming behavior, gender dysphoria, and the expressed desire for surgery. The high-profile case of Christine Jorgensen (1926–1989) in the 1950s brought media attention to the subject of transsexualism, partly because Jorgensen was a rare “out” trans person with financial power and social influence and partly as a result of her doctors publishing their account of her treatment (Meyerowitz 2002). The silence on the part of the APA on the subject of trans until 1980 has been explained as being the result of an unwillingness to recognize the efficacy of surgical treatment, in part owing to the psychoanalytically informed perception that gender dysphoria was a neurotic or psychotic delusion that should be “cured” using talking therapy (Drescher 2010a). However, even as early as the 1950s, when Benjamin was first
beginning to crystallize the concept of transsexualism, he would recommend that his patients should consult with mental health experts before undertaking surgical transformations.

Moves to replace “gender identity disorder” with “gender dysphoria” for DSM-5 (2013) were much discussed and debated by the APA in the consultation period prior to publication. Considerations included the perceived danger of stigmatizing an already vulnerable group further by considering their very identity as a mental illness. This was weighed against the concern that depathologization might lead to the withdrawal of medical support by insurers for trans people seeking hormonal and surgical interventions (Drescher 2010a). Lance Wahlert and Sabrina Gill (2017), in fact, point out that the “gender dysphoria” diagnosis in essence means that trans people in the United States may be considered ill enough to be diagnosed with a mental disorder but simultaneously be excluded from protections under the Americans with Disabilities Act. Finally, concerns regarding the treatment of trans youth centered on critiques of clinical practice aimed at attempting to persuade gender-nonconforming children to reject their gender identity and accept instead to live as their natal sex, which was seen as a cruel form of “reparative therapy” by some activists (Drescher 2010a).

Broadly, however, despite the potential disadvantages to some trans people of the partial demedicalization noted previously, the change in the trans diagnosis in the DSM parallels closely trends in trans activism. These include the broadening of the “trans umbrella” to include a spectrum of gender fluidity, as well as agender and nonbinary identifications. The main UK-based LGBTQI+ organization, Stonewall UK (2018), insists on this inclusive definition, and the work of activist-academics such as Alex Iantaffi and Meg-John Barker (2017) has popularized the notions of a gender spectrum and a “gender journey.” Such moves have signaled a break from the binary “crossing” metaphor on which the idea of “trans” was originally founded (Denny 2002). This definitional shift in the direction of activism is also echoed legislatively by a move away from a medical and legal gatekeeping process (that still includes coerced sterilization in many places) and toward a process of self-identification in a number of national contexts. These include, as of 2018, Argentina, Colombia, Denmark, Ireland, Italy, Malta, Portugal, and Canada, with a proposed similar change under discussion in the United Kingdom as well.

**When Absence Equals Illness: The Disorders of Sexual Desire**

The means of pathologizing nonnormative sexuality throughout history has largely been a matter of measuring the distance from a norm in terms of *object* (same-sex desire rather than opposite-sex desire), *act* (some preferred perverse alternative to reproductive heterosexual intercourse), or *quantity* of desire (too much or too little). As Peter Cryle and
Alison Moore (2011) have shown, discourses of “frigidity” in the nineteenth century, habitually ascribed to women, reflected sexist assumptions about the “appropriate” amount of desire women were supposed to feel. The nineteenth-century medical view held that women were naturally endowed with a lower libido than men; were it not so, the Austro-German forensic psychiatrist and father of sexology Richard von Krafft-Ebing (1840–1902) argues, “the whole world would become a brothel” (1893, 13). Yet, men also expected their wives to experience a sufficiency of desire and passion for their husbands, to be expressed, self-evidently, only within the confines of the marital bed, such that too much “coldness” was also presented as a problem to be solved (Cott 1978; Jeffreys 1985).

In the twentieth and twenty-first centuries, the misogynistic discourse of frigidity took on different forms, transmogrifying into the actively chosen identity of asexuality—or “ace” in activist community terms—and into “female sexual interest/arousal disorder” in the language of DSM-IV. Unlike the discourse of frigidity it replaced, however, a male counterpart also exists in the APA’s classification: “male hypoactive sexual desire disorder.”

Similar to what has been observed in the cases of same-sex desire and trans identity, the incremental DSM depathologization in the case of the disorders of sexual desire follows the emergence of a branch of identity politics and the advocacy of a pressure group, often spearheaded or supported by sympathetic medical allies. The sex researcher Lori A. Brotto and her team at the University of British Columbia have argued for asexuality having the status of an orientation, rather than that of a paraphilia or disorder (Brotto and Yule 2017). And concomitantly, in DSM-5, unlike in DSM-IV, it is indicated that these diagnoses may not be applied if the person presenting reports never having experienced sexual desire at all, such that the identity of “asexual” becomes a mitigating factor in classification. (Yet, given that some asexual-identified people report experiencing a degree of sexual attraction or desire in certain circumstances, the APA exception appears to be a rather blunt tool, suggesting that only the “approved” type of asexual person is “excused” a diagnosis.) The broader point, however, remains: where the discourse of “identity” gains sufficient traction, the diagnostic imperative of mental illness becomes more flexible.

Intersex or “Disorders of Sex Development”: An Exception to the Trend?

The medical establishment defines intersex conditions as congenital and chromosomal deviations from typical sex characteristics. For some intersex activists, however, these conditions are defined as “variations” in bodily morphology and therefore as not pathological (Inter 2015). Organized intersex activism began in the 1990s, when several national groups were established, including the (now defunct) Intersex Society of North America, founded by the high-profile intersex activist Cheryl Chase/Bo Laurent. Much activism focused in the 1990s, and continues to focus today, on the demedicalization of
these conditions and against the enforcement of sex-determining surgery in infancy. Intersex advocacy has been influential in debates on human rights and bodily autonomy; for example, in 2013, the United Nations’ Committee Against Torture looked into the impact of early genital surgery in Switzerland, China, and Hong Kong (Carpenter 2016). More recently, as in discussions of transgender rights, some intersex activists have argued that intersex individuals should have the option to self-affirm as women, as men, as nonbinary, as another gender identity, or as none at all (Carpenter 2016).

The case of intersex, then, reveals a similar tension between pathologization (intersex understood as deviation) and depathologization (intersex understood as benign variation, accompanied by calls for the move to self-identification) to that which has been seen in the cases of sexual orientation, gender identity, and lack of sexual desire. However, the narrative of a movement toward a gradual and partial depathologization of these phenomena on the part of APA is not echoed neatly in the case of intersex. Indeed, some see the APA, in tandem with other American medical organizations, as having, over time, reinforced and deepened the understanding of intersex as an illness. In the first decade of the twenty-first century, the North American medical establishment, including the American Academy of Pediatrics, renamed “intersex conditions” as “disorders of sex development” (DSD). The APA officially adopted this nomenclature in DSM-5 (2013). Activists such as Cheryl Chase vociferously opposed the introduction of the DSD terminology in endocrinology and psychiatry, because the language of disorder is arguably more pathologizing than the term intersex, as it suggests the need for medical (surgical) intervention and (psychiatric) regulation. The gender studies scholar Cynthia Kraus (2015) considered the move made within DSM-5 unhelpful, as it additionally reframed DSD as a specifier of gender dysphoria. This marked a departure from earlier editions of the DSM, where intersex was, in fact, an exclusion criterion for gender identity disorder. Kraus argues that this conflation detracts from the specific needs and experiences of both trans and intersexed individuals, while further pathologizing intersexed patients by giving them a second diagnosis.

It is also significant to note that the American medical establishment’s naming of DSD is the end point of a normalizing, colonializing process whereby Western understandings of “correct” bodies and binary gender are coercively applied to other cultures that have long recognized “third sexes” or a spectrum of intersex variations without attempting to “normalize” them. Scholars such as Paula Gunn Allen (1986) have pointed out that Eurocentric and medicalized norms have long been imposed on non-Western cultural understandings of sex and gender in this way.

**Some Concluding Remarks**

The APA has largely adapted—sometimes slowly, partially, and reluctantly—to trends toward social liberalization, thanks in large part to the significant influence of LGBTQI+
activism in the United States and the broader Western world. However, the use of the *DSM* globally as a tool for diagnosis and social categorization, as well as its potential to measure regressive attitudes toward LGBTQI+ people in parts of the world that still discriminate against them legally and culturally, should not be overlooked. In their analysis of the challenges of using the *DSM* for global understandings of mental health, Dan J. Stein, Crick Lund, and Randolph M. Nesse suggest that “a global mental health classification” would be preferable to the current *DSM* or ICD, as this “might also highlight societal-level risk and protective factors” (2013, 496). Stein, Lund, and Nesse use the example of depression, which has different cultural manifestations and meanings across the globe. However, the example of the sexuality and gender diagnoses are even more pertinent, as sexual orientation and gender identity are located at the intersection of cultural beliefs and exercises of power, psychological and emotional experience, and public health. There are also serious financial implications in the *DSM*’s homeland of the United States regarding the inclusion or exclusion of sexual and gender diagnoses. The Food and Drug Administration’s approval of the drug flibanserin (sold under the brand name Addyi) for the treatment of female sexual interest/arousal disorder in 2015, for example, makes the continuing existence of that diagnosis a matter of financial interest to the pharmaceutical industry. Such examples as these reveal the extent to which the *DSM* continues to be a locus and tool of political, fiscal, and regulatory power, even as its contents are influenced and shaped by the winds of social change.

Diasporas, Queer

FARHANG ROUHANI
Professor of Geography
University of Mary Washington, Fredericksburg, VA

Ways of critically thinking about the queer diaspora and how it is unique from other types of diasporas.

The term *diaspora* came into widespread academic use in addressing the dispersal of populations that reside across multiple state territories but that continue to maintain a durable set of relationships and a common sense of home or homeland. Some of the earliest examples refer to the Jewish, Greek, African, Palestinian, and Armenian diasporas and to the relationships of trauma, suffering, and loss associated with population diffusion. Over time, scholars have expanded what counts as diaspora from a singular association with victimhood to also include labor, imperial, trade, and deterritorialized diasporas (*Cohen 1997*). At the same time, the term has entered widespread popular usage, as journalists and others use it synonymously with the notion of an immigrant group, either in one country or multiple countries, as well as to the identities, living spaces, and forms of belonging of such immigrant communities and to ways of thinking about them. In the introduction to their pioneering edited volume *Queer Diasporas* (*2000*), Benigno Sánchez-Eppler and Cindy Patton argue that the study of queer diasporas is vital in how it brings together the insights on sexual otherness gained through LGBTQ studies and on ethnic and racial otherness brought forth in immigration studies. “Attending to the mobility of sexuality across the globe and body, as a materiality and a discourse … brings new insights into the individual and collective paths of queer escape and reconstitution” (3). This is the promising terrain that queer diasporic studies occupy.

While the term *diaspora* has come more and more into popular and academic usage, Sima Shakhsari warns against the “chic of diaspora” (*2012, 25*), the extent to which diaspora has been a trendy academic buzzword. The problem with this is that such a superficial application of the term assumes ease of movement and oversimplifies the processes of hybrid identity formation for transnational, cosmopolitan subjects. In Shakhsari’s analysis of the ways in which Iranian queers are represented in cyberspace, she concludes that while often differentiated, *diaspora* acts not all that differently from *exile*, in that it similarly “conjures up an idealized image of homeland as fixed and imagines a homogenous heteronormative Iranian community” (32). Thus, any critical perspective on diaspora, thus, needs to go beyond equating it with transnationalism or cosmopolitanism and to pay attention to the fact that diasporas are always complex, conflicted, and differentiating.
Two more recent dynamic conceptualizations of diaspora studies argue against objectifying diaspora as a coherent subject of study and assert its critical dynamism. Rogers Brubaker argues that any usage of the concept of “diaspora” needs to deal with the power relations through which immigrants construct, adhere to, and challenge community structures in a contextualized way that does not assume essential cohesion around immigrant ethnic identity as a category. Instead, “it may be more fruitful, and certainly more precise, to speak of diasporic stances, projects, claims, idioms, practices, and so on,” which creates opportunities for empirically based understanding (Brubaker 2005, 13). Stéphane Dufoix (2008) similarly perceives diasporas as idioms, stances, practices, and arguments rather than a congealed identity. In his categorization of diasporic experiences, Dufoix identifies multiple modes through which diasporas are constructed in relationship with the regime/country of existence, a referent-origin community, and the spatial relationships between individuals, groups, and communities, including but not limited to national state identities and communities.

These arguments have laid the groundwork for conceptualizations of queer diasporas by revealing diasporas to be contingent, contextual, multiple, overlapping, and conflicting in different ways, while also serving to urge scholars to approach them critically, rather than through objectified, neutral categories such as nation, community, and family. For queer Muslim migrants in North America, for example, the spaces that they occupy by way of their sexual, religious, and ethnic/racial identities means belonging to communities that are often in opposition to one another and leads to the need to create new identities and communities that transcend the limitations of the existing ones (Rouhani 2007). In examining queer diasporic contexts, one must always question the categories one holds as objective and neutral.

**Queer Diaspora Studies: Ideas and Practices**

Queer diasporic studies bring together the new insights into diaspora studies with queer theory. Queer theory has brought together an extensive critique of the normativities of life and subject formation, an emphasis on the social and political significance of transgression and liberation, and a refusal to give definitions, allowing queer theory to continually refresh and, in a way, continually queer itself. The development of queer diaspora studies since the late 1990s has helped bring new dynamism to both queer theory and diaspora studies. As Gayatri Gopinath argues, “The concept of a queer diaspora enables a simultaneous critique of heterosexuality and the nation form while exploding the binary oppositions between nation and diaspora, heterosexuality and homosexuality, original and copy” (Gopinath 2005, 11). Just as the queer is positioned as an imitation of the heterosexual, diaspora is seen as inferior to the nation, and bringing the two together unsettles and dislocates assumptions about both.

While centering diaspora studies on queerness helps to complicate understandings of
kinship, nation, and nostalgia, a focus on diaspora helps to bring forth much-needed questions of race, colonization, and globalization to the center of queer studies. This combined perspective thus productively serves as an interpretive framework to trouble assumptions and to make connections. These ideas are effectively brought forth in ethnographic studies of queer diasporas. Examining the ritual Catholic religious space of performance by Filipino gay men in New York, for example, Martin F. Manalansan IV (2000) shows how they occupy a syncretic space that is neither here nor there, local and global and transmigratory in scope, with reflections on mainstream US urban gay culture, Filipino Catholic culture, and Spanish colonialism. While fraught with challenges and complications, their cross-dressing ritual performances also allow them to creatively write their own lives and worlds.

This framing makes it essential to understand and critically interpret the complexities of the relationships between queer diasporic subjects and the mainstream queer host societies in which they live, in relational racial and political terms. As such, queer diasporic studies pay attention to how queer diasporic communities are constructed in relation to mainstream queer communities, most powerfully developed in Jasbir K. Puar’s 2007 work on homonationalism. Puar argues that in the European and North American contexts, homonationalism represents a national, patriotic, mostly white version of homosexuality that asserts its moral superiority by differentiating itself, particularly from Muslim racial and sexual others. As such, queer diasporic identities and communities are constructed in relation and opposition to the existence of such a powerful imposing queer political force.

The significance of this idea of homonationalism for queer migration studies is particularly evident in the experiences of LGBTQ asylum seekers and refugees in Europe and North America. In his analysis of the experiences of sexual orientation and gender identity refugee asylum seekers, volunteers, and lawyers, David A. B. Murray (2016) shows how homonationalism matters in the lives of queer refugees by legally regulating “authentic” and “inauthentic” LGBTQ refugees, based on dominant notions of queer “refugeeness.” While the incorporation of sexuality and gender has disrupted state-sanctioned ideas about who counts as a refugee, it has also been folded into the nation-state’s modes of gatekeeping and identity keeping, with far-reaching consequences on the lives of queer transnational migrants.

David L. Eng constructively argues for the potential in beginning from a queer diasporic approach that “emerges as a concept providing new methods of contesting traditional family and kinship structures—of reorganizing national and transnational communities based not on origin, filiation, and genetics but on destination, affiliation, and the assumption of a common set of social practices or political commitments” (2003, 4). In this sense, a queer diasporic approach can simultaneously challenge the normative, assumed kin and ethnic relations of community and provide the source and inspiration from which to create new senses of affiliation, kinship, and community based on a meaningful,
understood, and agreed-on set of commonalities. Expanding on these ideas in his 2010 book *The Feeling of Kinship*, Eng analyzes films, documentaries, and literature by Asian and Asian American artists in order to reveal how such things as queer Asian migrant labor, transnational adoption from Asia, and the legacies of Japanese internment form the base of narratives of racial forgetting and queer freedom in the present.

Queer diaspora scholars emphasize the importance of developing a methodology that consists of critical reading and interpretation practices. A queer perspective works "as a methodology, an oppositional mode of reading, interpretive strategy, or critical lens through which to question dominant ideologies of gender, sex, and nation" (Parker 2011, 640). Such a methodology works to read and expose taken-for-granted assumptions and normativities wherever they appear, even if they arise from what appears to be a queer source in the first place. For queer migrants, such reading practices are necessary simultaneously in relation to the dominant voices in the host country, the leadership of the immigrant community, and the mainstream gay/queer culture.

While most of the queer diaspora literature concerns queer subjects, a queer methodology can be applied to destabilize other practices of normativity (Wesling 2011; Mack 2017). Mehammed Amadeus Mack (2017), for example, shows how French Arabs and Muslims are queered as inferior, abnormal, and dangerous sexualized subjects within the dominant culture of French whiteness. At the same time they present new and dynamic possibilities for what French culture can be, by creating new opportunities for queer youth and adult masculinities and community as different from mainstream French queerness. As such, they are both queered as deviant from above and are creatively queering Frenchness from below. Being queered and doing the work of queering, in essence, are not the exclusive domain of queer-identified subjects, and a queer diasporic interpretative framework helps to simultaneously reveal the spaces of domination and the opportunities for transgression, liberation, and creativity from below.

**The Geographies of the Queer Diaspora: Home, Desire, Belonging and Unbelonging**

Of particular concern to many queer diaspora scholars is the experience of home and its related associations with homeland, community, nostalgia, family, community, and belonging. While mainstream diasporic conceptions of home and homecoming often present a linear though complex narrative, from the loss of home, through exile, to the recapture of home in the migrant community, queer diaspora scholars approach the home through a perspective that engages with the multiple negotiations with the past, present, and future that queer migrants face (Fortier 2001; Mai and King 2009). From a queer perspective, the home becomes more visible as an unsettled, sometimes violent site beyond the assumptions of cohesion in ethnic-immigrant communities (Wesling 2011). Unlike the
progress narrative of mainstream diasporic narratives, the home is neither a resolution nor a refuge from dominant society but a space that is itself fraught with tension and complexity.

Queer diasporic approaches complicate the idea of a sense of home in a way that shows how it is simultaneously desirable and undesirable, possible and impossible. As Dina S. Georgis compellingly argues, diaspora is less about the space of the home and more about the space of the loss of home. "When repudiated desire, which is to say queer affect, enters the space of the nation, we return to the space of diaspora: to our ambivalence, to our fraught longing, to our aggression and negation of home, and to the Door of No Return" (2006, 13). This complex relationship between diasporic desire and the tensions around longing significantly complicates the notion of diasporic home as any kind of refuge within a larger society. It also points to the complex ways in which desire, yearning, and, in general, affect figure into diasporic experiences in a way that is often otherwise underrepresented in diaspora studies.

While conventional diasporic studies pay much attention to the “homing” instincts and desires through which people construct new, durable communities, queer diasporic scholars unsettle and disturb the often taken-for-granted ideas of attachment as given, inevitable, or desirable. Johanna X. K. Garvey uses the concept of “queer (un)belonging” to identify habitable spaces that “undo belonging while not leading to the destructive behavior of not-belonging” (2011, 757). This notion of queer unbelonging starts with the premise that there is no such thing as a “queer homeland.” While any sense of a diasporic homeland is imbued with mythic, nostalgic attributes, in the context of the formation of a queer diaspora such a point of origin is simply impossible. While a queer diasporic stance disavows belonging in a stable, settled sense, it is impossible also to live in a permanent state of not-belonging. “Queer unbelonging” represents a space that seems impossible but can be made habitable and real. In her analysis, Garvey identifies some of the major elements of queer unbelonging as an embrace of the reality of daily migrant life that does not conform to diasporic nostalgia, the shaping of a different relationship to time and space that does not conform to a linear narrative, and new methods of reading and identifying people that incorporate difference into community in a way that introduces instability, uncertainty, and dynamism into a previously static conception.

What a queer diaspora approach does above all else is to show the constructive potential of residing within the uncomfortable spaces that disorient normative domestic arrangements. This uncomfortable though essential and life-giving relationship with belonging is something that queer diasporic scholars examine particularly in the lives of queer-identified migrants, who have an unsettled relationship with both their immigrant and mainstream gay host communities but also with diasporic subjects who are not sexual or gender minorities. The strength of this framework lies in its simultaneous emphasis on how diasporas are subjugated and how they creatively carve out spaces of liberation. Mack
(2017) provides a compelling account of such a form of queer unbelonging through his discussion of Arab and Muslim ethnic virility cultures in France.

In his 2015 analysis of US Iranian women’s memoirs, Farhang Rouhani examines how a queer diaspora lens supports a vital set of reading practices to counter the conventional Orientalism through which people read into experiences of home, family, gender, and nation. This approach calls into question the normative, linear progress narratives through which people interpret these memoirs, seeks to move beyond debates over what counts as “authentic” in the Iranian diasporic experience, and challenges how ideas of Iranianness and Iranian Americanness are assumed to be coherent, stable, and essential categories. At the same time, Rouhani argues that these memoirs can be queerly read for ways of relating and living differently, constructing an unstable sense of home that lives critically with the past, present, and future in a reimagined, liberatory way. As Gopinath argues, such an approach allows research to critically interpret but also support “the ways in which those who occupy impossible spaces transform them into vibrant, livable spaces of possibility” (2005, 194).

Digital Cultures in Latin America

ELISABETH JAY FRIEDMAN
Chair and Professor, Politics Department
University of San Francisco, CA

The Latin American LGBTQ community's use of the internet and digital tools to create community, promote dialogue, and advocate for LGBTQ rights.

LGBTQ activists in Latin America organized before the advent of the internet, but the internet and social media in particular have expanded opportunities and brought new complexities to their work for recognition and rights. This entry offers a consideration of the role of online media in such activism through two lenses. The first is a focus on LGBTQ “counterpublics,” or “the places, spaces, or means through which those pushed to societies’ margins develop their identities, construct communities, and formulate strategies for transforming wider publics” (Friedman 2017, 3). This concept is frequently used to understand how internet-based media provides a place for both personal expression and public citizenship in ways that enable resistance to the hetero- and cisnormativity enacted through mainstream media and society (Ciszek 2017; Harp, Bachmann, and Guo 2012; Pullen 2010; Soriano 2014; Warner 2002). In counterpublics, individuals and communities can engage with “public issues that are barred, tabooed, restricted, or subject to regulation offline” (Corrêa et al. 2011, 23) as they seek to develop their own identities and transform society. Given their history of marginalization, such counterpublics have long developed within an alternative media field.

The other lens is one that assumes the entwined nature of social mobilization and media technology, rather than seeing them as static, separable entities. Although the internet is popularly understood as a tool or resource for those seeking social change, both its development and deployment demonstrate a sociomaterial reality. The internet, like all technology, is both “socially constituted and constituting” (Dahlberg 2004), reflecting and refracting social relations of power, values, and the lived experiences of material reality. LGBTQ counterpublics incorporate internet applications in ways that are informed by specific histories and present-day contexts of access and activism.

Role of Online Media in LGBTQ Counterpublics

LGBTQ counterpublics in Latin America were well positioned to take advantage of the early internet. In the decades before the 1990s, they took part in regional resistance to authoritarian repression and, later, attempts to expand democratic openings to include a
wide range of rights. Even as right-wing regimes targeted them, many Left parties and movements, as well as the revolutionary states of Cuba (1959–) and Nicaragua (1979–1990), rejected, if not repressed, gays and lesbians in their promotion of heteronormative social ideals. The advent of democracy brought more political space for civic organizing but no guarantee of acceptance; police and social violence were endemic, especially against those who transgressed gender norms in their self-presentation and actions. However, the HIV/AIDS crisis beginning in the 1980s led to more attention—and resources—for LGBTQ communities, as they strengthened internally and networked across national and international borders. Reacting to being sidelined in gay rights groups and straight-dominated feminist organizations, lesbian feminists founded autonomous groups such as Centro de Investigación y Capacitación de la Mujer (Center for Research and Training for Women) in Mexico and Mujeres Creando (Women Creating) in Bolivia, while also connecting transnationally at the Encuentros Feministas Latinoamericanos y del Caribe (Latin American and Caribbean Feminist Encounters). Trans activism through organizations such as the Asociación de Travestis, Transexuales y Transgéneros de Argentina (Association of Travestis, Transsexuals, and Transgenders of Argentina) also grew in strength and numbers to draw attention to the specific problems trans people faced in social, medical, and legal arenas. LGBTQ groups built coalitions with feminist movements in promoting “sexual citizenship” and made common cause with other counterpublics in an attempt to influence political representatives and policy makers. Thus, in response to dismissal and worse in wider publics, activists built their own organizations, developed alliances, and extended networks across national and regional borders.

**WALTER MERCADO: QUEER DIGITAL ICON**

Walter Mercado (1932–), known since 2010 as Shanti Ananda (which means “peace everlasting” in Sanskrit), is a Puerto Rican astrologer, media personality, and best-selling author. For over thirty years, Mercado has hosted radio, television, and internet-based programs that include horoscopes and astrological predictions that are widely consumed across the hispanophone world, including in the United States among Latinx-identified populations (*Latinx* being a gender-neutral form of the Spanish *Latino/Latina*). He is the author of several books about mysticism and spirituality and has appeared in various other media, including advertisements for retail brands, Spanish-language telenovelas, and films aimed at a Latinx audience. His programming has also spawned a variety of products available for purchase in stores and online, including prayer beads, candles, and other spiritual iconography. Broadly speaking, his work promotes the idea that some gifted people, through intensive study and focus, can access transcendental Orientalist wisdom and achieve a fuller understanding of astrological influences on events of both personal and global significance.
For most of Mercado’s career, his programming has been mainly accessible on television, on radio, or in print. Since the advent of social media, however, his primary means of connecting with his audience has been through Twitter (@waltermercadotv) and similar sites. The digital age has given Mercado the opportunity to expand his audience and his brand, both intentionally and unintentionally. For example, while Mercado has not publicly discussed his sexuality, his flamboyant public persona is widely associated with queerness and a camp aesthetic. In the internet age, he is known as much for his appearance and his wardrobe as for his programming, and he has achieved a status as a queer icon despite his coquettish and evasive responses to questions about his identity status. In public appearances, Mercado regularly wears lavish capes and robes, styles his hair in a bright blond bouffant, appears to have had cosmetic surgery, and wears visible makeup, all of which has invited much speculation about his sexuality. However, Mercado has been willfully ambiguous when asked about this subject by interviewers. For example, in a 2008 online interview with the American Spanish-language television network Univision, Mercado replied to questions about his sexuality by stating that he practices tantra, continuing: “You unite your masculine and feminine forces and achieve a cosmic orgasm…. Some Hindu masters didn’t have physical sex, but cosmic sex” (Hedrick 2013; translation by Austin C. Eklund). References to physical sex that transcends boundaries of gender and corporeal desire come up regularly in Mercado’s work. Scholars note that, ironically, his ambivalence about his own sexuality has done some of the cultural work of queering him as a public figure despite his transparent avoidance of the subject. For example, the cultural historian Diana Taylor remarks that

Walter specializes in the art of reversal, exaggeration, conflation, contradiction, camp, ho cursi, rasquache, and relajo. He endows the drag queen with papal authority…. Instead of acting as the intermediary for God’s love, he offers us his own…. He is a ham, a diva, a comadre, a connoisseur, a businessman, and an hombre culto.

(2003, 125)

Mercado is by no means the only example of New Age mysticism in Latin American culture. For example, El Indio Amazónico is another celebrity Latinx healer and spiritual guide who, in lieu of providing his “services” through the media, offers in-person diagnosis and treatment (e.g., palm and tarot card readings) in New York City, Los Angeles, and his native Colombia. However, Mercado is inarguably the most prominent representative of Latin American queer mysticism. Paradoxically, many queer-identified and gender-nonconforming Latin Americans have struggled to find
acceptance in the region, which remains overwhelmingly Christian. As a result, many queer and gender-nonconforming Latinx people identify as unaffiliated with mainstream religious groups, instead preferring to engage with nondenominational spiritual practices, many of which have Eastern origins. Many consider Mercado the primary ambassador of Orientalist mysticism in the Spanish-speaking world, with scholars noting that such mysticism manages to coexist peacefully even with traditional Catholicism.

Scholars also suggest that Mercado’s access to spiritual capital permits him to hide his queerness in plain sight, as he regularly indicates that his ambiguous sexual and gender presentation is attributable to the form of mysticism he practices and promotes. To some, Mercado’s queer and camp aesthetic is consistent with notions of a Latinx identity, which has historically been characterized by “excessive affect and self-display” and other strategies of “self-fashioning,” including taste, music, food, and other cultural markers. This presentation, a form of queer-specific camp, has kept generations of audiences loyal to Mercado and to the particular Mercado brand of strange, contradictory, and wildly compelling televised spirituality for which he is responsible.

**BIBLIOGRAPHY**

*Austin C. Eklund*
Extensive networking across the region made these counterpublics ideal spaces for the diffusion of networked technology. Prior to the massification of commercialized access in the early twenty-first century, they benefited from a deliberate expansion of the earliest networks of networked computers outside of the market- and state-based priorities of commercial and governmental providers. The Association for Progressive Communications (APC) connected civically minded internet service providers into a global network through which activists and advocates could communicate nationally and globally (Willetts 2011). Those based in Latin America and Africa understood both the potential and the great need for alternative networks of information and communications, and they lobbied contacts in the Global North to ensure access to the necessary hardware and software. Thus, as they emerged from the authoritarian period of the 1980s, many in Latin America became “early adopters” of the internet through APC members (and some founders) across the region: Alternex in Brazil, Chasque in Uruguay, Nicarao in Nicaragua, Ecuane in Ecuador, La Neta in Mexico, and Wamani in Argentina. APC helped Latin American activists participate in national and global counterpublics a decade before commercial internet spread across the region.

The commercialization of internet access and the rise of social media have transformed connectivity and modalities, and progressive counterpublics have taken advantage of them. In Latin America, activism is now as highly correlated with social media use as it is with political ideology and participation in face-to-face community organizations (Valenzuela, Arriagada, and Scherman 2012; Valenzuela et al. 2016); a reported 65 percent of activists use social media to engage with one another and build networks through profile creation and contacts (Harp, Bachmann, and Guo 2012). A younger generation of activists relies on self-curated information on their Facebook feeds rather than mainstream media (Scherman, Arriagada, and Valenzuela 2015). For them, there is no bright-line distinction between online and offline arenas; instead, physical mobilization is enhanced by online participation. As information circulates across networks, it not only helps to shape protest narratives but also encourages turnout as contacts repost, “like,” comment, and promise to attend meetings and rallies (Salzman 2016). However, traditional sources of inequality, such as class, rurality, race, and gender, continue to affect access (Scherman, Arriagada, and Valenzuela 2015; Valenzuela et al. 2016; Friedman 2017). To take the reality of the region into account, counterpublic communities often deploy “chains of access” strategies, using a combination of online and offline media to connect those with and without easy access (Friedman 2017).

**Private Space, Public Platform**
LGBTQ counterpublic internet practices reflect the larger politics of sexuality and gender in the region: a blurring and reconfiguration of what is considered appropriate for private and public life. Such an approach is prompted by their sociopolitical context. There has been notable progress: the majority of countries have outlawed discrimination on the basis of sexual orientation and increasingly gender expression or identity; openly LGBTQ people serve in public office; and LGBTQ life has become visible at enormous pride parades, in lively gay neighborhoods, and on the ever-popular telenovelas (soap operas). But many obstacles remain, from constitutional prohibitions on same-sex marriage to frequent violence against transgender people to the ways in which poverty and racial discrimination interact to restrict access to rights protections. Because the region is characterized by hetero- and cisnormative institutions, asserting a nonnormative sexual or gender identity implicitly (if not explicitly) politicizes the putatively private issues of self-definition, love, relationship, family, and the like. LGBTQ individuals and communities continue to experience rejection and, too often, harm, for their challenge to social norms. But as with others who experience social opprobrium, “in the case of developing countries and other semi-authoritarian national contexts … online networks, however constrained by problems of access, can in fact offer real spaces and possibilities for oppressed groups to build new democratic narratives” (Matos 2017, 420). Thus, LGBTQ people have incorporated the internet for the twinned counterpublic goals of finding safe, private spaces for developing identity and finding community and of occupying a public platform from which to challenge marginalization and exclusion. And here they have found a synchronicity of internet affordance (its “inherent” properties) and community norms and needs for networking and even survival.

For those beginning to explore their sexual and gender identities, particularly in contexts where such exploration is difficult or dangerous, the internet can provide a “virtual lifeline” (Stein 2003, 182) of information and interaction instead of isolation. Those who can access it—increasingly through mobile devices but also on home, workplace, and school computers as well as in cybercafés and community centers—can assume their identity before coming out in “real time.” Information on and discussion about identity, as well as rights, health, intimate relationships, sexual pleasure, and more, can be accessed through text (and texts), photos, and videos. The opportunity to engage in self-representation, especially through social media, has both individual benefits and can show others that they are not alone. Although the deeply embedded inequalities of Latin American societies—such as class, race/ethnicity, and geographical location—have mediated LGBTQ access to digital modalities from the beginning, the networked existence of LGBTQ communities has also helped spread digital connections. Before the widespread use of cell phones, for example, organizations dedicated to LGBTQ empowerment and rights often included computer/internet access as part of their services.

Even before the advent of social media, email and websites enabled LGBTQ individuals to discern their identities in relatively safe spaces. The founders of the lesbian magazine
LeSVOZ in Mexico City and the regional lesbian discussion list Safo Piensa reported how often women would reach out to them to ask for resources or express gratitude for the information and connections they provided. Personal contacts were some of the most popular areas of early websites, and a crucial element of community building, giving readers a sense that others like them existed. Discussion lists and other applications directed at and heavily used for exchange, such as the Yahoo groups run by the decades-old Brazilian organization Grupo Gay da Bahia (Gay Group of Bahia), prefigured the social media explosion. Concerns for privacy and safety meant that founders often sought digital protection for the online community building they were undertaking. But these were not spaces divorced from the reality of dissention and debate; difficult topics, such as whether only women-born women could form part of lesbian feminist organizations and communities, were aired, and the resulting discussions could be explosive (Friedman 2017).

Virtual Networks for Activism

Virtual networks enabled LGBTQ people to “transgress the frontier of intimacy,” exchanging information about issues that the wider society would prefer remain hidden in private, thus helping to break with the culture of silence (Hooker Solano 2017, 127; translation by author). As social media advanced across the region, it became an instant arena for LGBTQ “transgressions”; for example, the Orkut social networking platform, which was highly popular in Brazil from its advent in 2004 until overtaken by the Facebook phenomenon, provided space for “dissident sexual selves” (Corrêa et al. 2011, 63). Such transgressions could also lead to an assertion of identity in public, often translated into a
demand for visibility: for example, in Latin America *visibilidad lésbica*, or lesbian visibility, is a frequently heard demand for the recognition of lesbian existence. While resource restrictions make offline space for lesbian, trans, and queer women difficult to maintain, digitally enhanced counterpublics enable activism and other forms of community expression (*Friedman 2017; Ciszek 2017*).

Although hardly unique to this community, the process of “sharing ... common experience serves as an affirmation of belonging” and helps promote mobilization despite physical separation; online exchange “works as the foundation for a social movement among members ‘disembedded’ physically, but ‘embedded’ socially and politically” (*Soriano 2014, 33*). While many movements may benefit from such action at a distance, it takes on particular relevance for those who cannot easily access local sources of support and solidarity, such as children alienated from their families because of their sexual or gender identities. Nevertheless, digital community is no panacea for real-world rejection. It can result in a kind of segregation, enabling users to rely more on virtual support than seek to build it face-to-face in local communities. As inspirational as border-crossing ideas and an imagined international community may be, lack of attention to the specific contexts and lived experiences of local actors can be detrimental to local and national solidarities and activities. Moreover, online means and spaces are hardly free from the dangers and discrimination of offline life. As LGBTQ individuals raise their profiles and offer their views online, aggressive commenters or hackers often pursue them there (*Soriano 2014; Friedman 2017*).

Despite such challenges, a wide range of organizations have brought activist projects online, seeking to nurture and inform local, national, and regional audiences. In doing so, they not only focus on policy change and other political demands, as do other counterpublics; they also continue to address a wide range of topics in LGBTQ culture that, like their struggles for recognition and justice, are often sidelined in society and go unreported in mass media. Portals such as Um *Outro Olhar* (An *Other Look*) from Brazil, *Rompiendo el Silencio* (Breaking the Silence) from Chile, and *SentidoG* (Gay Sense) from Argentina, along with the *OrgulloLGBT* (LGBTPride) blog from Colombia, have provided a range of resources, from international news, to entertainment and leisure, to psychological consultations, chat rooms, and personals. Illustrating the continuing importance of transnational support, the Colombian American Andrés Duque, a prolific blogger and activist, has reached out through Twitter (@noticiasLGBT) to offer updates on Latin American and international LGBT news, sending out well over 100,000 tweets to more than 50,000 followers since 2009.

While some efforts have wholeheartedly embraced the “pink dollar” commercial opportunities for selling lifestyle, merchandise, and tourism, others focus more on individual growth, community development, and activist campaigns. More targeted efforts, such as the now-defunct electronic journal *La Revista Labia* (The Labia Magazine) and the
database of scholarly articles of the Peruvian organization Grupo de Activistas Lesbianas Feministas (Lesbian Feminist Activists Group), or the Mexican lesbian feminist magazine and website LeSVOZ, bring their dedication to specific communities online. Resources continue to be a problem, however, with the frequent disappearance of web-based projects showing that the challenges of sustainability go beyond internet access. LeSVOZ, for its part, adapted to changes in the internet by relying on a cadre of volunteers but found it time-consuming to keep up with the dynamic mediascape. Online, it migrated from a basic website to blog and Facebook, defying the censorship, ignorance, and high cost of mass media outlets by circulating information, connection, and analysis online. But it also kept a print magazine in circulation, enabling readers for whom a cybercafé is too public a venue for personal perusal to read the latest at a time and place of their choosing (Friedman 2017).

One notable example of the public-facing organizing enhanced by internet incorporation are the campaigns for LGBTQ recognition from Argentina. The successful campaigns for same-sex marriage (2010) and genderidentity recognition (2012) benefited from the efficacious deployment of online resources. Esteban Paulón, a prominent leader and prodigious tweeter, explained in a 2012 interview that activists took advantage of the more static and social media of the time—web portals, Facebook, and blogs—and thus “won the technology battle” with the conservative opposition (Paulón 2012). Inspired by the example of the Spanish same-sex marriage law passed in 2005, a younger generation of activists eagerly contributed their skill sets. The graphic designer and journalist Martin Peretti Scioli, based in Rosario, Argentina, set up an information portal known as Actitud Gay (Gay attitude). He and collaborators not only carefully followed developments in Argentina but brought together research about LGBTQ issues across Latin America and other world regions for encouragement and perspective. It became a resource for the region, with traffic from throughout Latin America, as well as Spain. During the heat of the legislative debate, as the portal streamed live congressional debate, it received thousands of views a day.

**Mixed Media**

Online efforts have gone forward in combination with other media. This is a hallmark of internet incorporation in Latin American counterpublics, given the reality of the many inequalities that transect these diverse communities. Even as the reach of the internet expanded through the second decade of the twenty-first century, Vox (Voice), an LGBTQ organization based in Rosario, Argentina, sponsored a radio broadcast over the national public network called Pasa en las mejores familias (It happens in the best families) focusing on a wide range of issues and providing a space for both discussion and denunciation of discrimination and violence. The show producers and hosts were aware that in order to reach older adults, or those in marginal neighborhoods or in more remote or rural areas,
they needed to share the information they got from the internet in a more accessible format. The radio show could be a safe space for engaging with LGBTQ issues where the listeners could remain entirely anonymous—and where young people and their parents could learn together. To represent the show’s wide audience, its producers broadcast questions and comments that came to them from their telephone answering machine and through Facebook and by text message.

Vox is not the only organization that uses a combination of newer and older media to reach its community. The Nicaraguan radio show *Sin máscaras* (Without masks) also rebroadcast news from the internet and provided a forum in which people could ask questions anonymously. In this way the show was also able to reach those living in remote areas where radio is the only accessible media, to seek the information they wanted (Howe 2013). This kind of “dialogic” media-based activism formed a basis for later social media use (Howe 2013). Local activists were well placed to become mediators of information circulating globally ever faster and through ever more applications.

**Blogging for Self- and Social Recognition**

In Latin America, according to Carolina Matos, “blogs have particularly emerged as networks for debate and dialogue, alternative information, democratic self-expression and political criticism” (2017, 420). They are of considerable importance in countries such as Nicaragua, where conservative values and everyday violence can make LGBTQ life difficult. Nicaraguan gay and lesbian bloggers in their twenties have transformed this application to suit their counterpublic needs for “escapes, resistances, and transgressions” (Hooker Solano 2017). Some deploy anonymity or fictitious personas as a form of catharsis when coming out is not an option in “real time.” For the activist Franklin Leonel Hooker Solano, blogging has been a felicitous “escape from offline reality,” enabling empowerment: it “has been my biggest act of autonomy, has strengthened my capacity of agency, my right to be however makes me most happy, my capacity to decide when to write, about which issues, in which formats and how long” (2017, 113; translation by author). Together, blog writers and readers can experience companionship and build community based on shared experiences (Hooker Solano 2017). Lesbian and gay bloggers have also intervened in broader society by making public that which is rendered private, insisting that “there are infinite ways of being-inhabiting our own bodies” (Hooker Solano 2017, 17; translation by author). In doing so they break with dominant narratives, making visible what gay men and lesbians have brought to politics, society, culture, and history.

In Argentina, a similar goal has been the driving force behind the lesbian feminist blog *Potencia Tortillera* (Dyke Power): to insist on making visible both contemporary activism and lesbians’ own history, too often passed over in other venues and unknown to broader publics. The founders reimagined the blog format as a digital archive, including print, photography, video, and audio clips. Its primary intended audience is national, to show the
lesbian counterpublics of Argentina a past they can learn from and build on. The digital archive includes a wide range of generational and political positions and captures the stories of those organizing both inside and outside the powerful capital city of Buenos Aires. As so often happens with such projects, it has been based on volunteer labor, in this case so that there would be no external pressures for a particular politics.

Blogs have also been the application of choice for trans activists in Brazil seeking to denounce the all-too-frequent violence against their communities, including the terrible occurrences of transfeminicide. As with the Nicaraguan bloggers, these bloggers comprise a new generation that engages in both “self-recognition and the struggle for social recognition” through a new form of “political praxis” (de Lima Carvalho and Carrara 2015, 394; translation by author). The ability to post, repost, comment, and recirculate through other media both enables public deliberation and stimulates mobilization. As in Nicaragua, the focus on internet-enabled, particularly blog-focused activism, demonstrates a generational divide in activist approach. In the Brazilian trans community, this divide maps over a larger debate over the linked strategies and goals of activism. On one side, the older generation is concerned that the internet has been “overvalued ... as a space for activism” and argue that offline action is more effective (de Lima Carvalho and Carrara 2015, 396; translation by author). To them, effectiveness is measured in terms of legal change. On the other side, the younger generation insists that online discussions can enable exchange with other counterpublic communities and wider publics. These exchanges, focused on shifting the way people think, are this generation’s central concern.

LGBTQ Latin Americans have integrated the internet into their counterpublics to enhance both their private and public lives, while insisting on defining the borders between them in ways that benefit their community instead of conforming to what wider publics expect or approve. Those who have experienced isolation because of their sexual or gender identity can learn more about themselves and build community. Through a combination of old and new media, activist resources and alternative information are circulated and recirculated in ways that are critical for those sidelined or stereotyped by mass media. Ever eager to communicate their own reality, LGBTQ individuals and activists alike have embraced the shifting landscape of modalities, from mail, websites, and early social networking sites such as Orkut, to later ones including Facebook, Twitter, and blogs, to present their perspectives to each other and the public, as they seek to shift the terms of the debate over the politics and policies of sexualities and genders. As the Argentine lesbian feminist activist and Potencia Tortillera cofounder Fabiana Tron writes of the space of the internet, “The idea is to try to construct another imaginary, in which gay, lesbian, travesti people would not be seen as monsters, but more as other ways of being people” (quoted in Friedman 2017, 182).

Dissidence in Singapore

J. DANIEL LUTHER
PhD candidate, School of Languages, Cultures and Linguistics
SOAS University of London, United Kingdom

The ways in which queer activists navigate the authoritarian laws of the city-state of Singapore, particularly through performance art.

Dissident sexual minorities in Singapore struggle against a unique form of governmentality that is both authoritarian and paternalistic. Their struggle is compounded by the small size of the country and the vast reach of state power, which leaves little recourse to the shelter of anonymity or protest politics familiar in Western liberal democracies. This entry examines the unique dissidence mounted by sexual minorities in Singapore and how their strategies of survival and resistance fill in the nooks and crevices that form between the omnipotent tentacles of authoritarian state power. Sexual minorities in Singapore exploit loopholes within the government’s own laws to negotiate the terms of their visibility, expression, and identity. The entry begins by examining the way in which these loopholes created the conditions that led to the formation of Singapore’s Chinatown as a gay district. The entry then outlines the theoretical debates around these loopholes—known in Singapore studies as illiberal pragmatics—and finally explores the way in which the government’s illiberal pragmatism becomes the foundation for dissident strategies of resistance emerging from the spatial possibilities of the gay district of Chinatown.

Chinatown: Singapore’s Unofficial Gay District

Located within the heart of Singapore at right angles from the financial district around the spruced-up Marina Bay is Chinatown, one of three pockets of state-designated cultural heritage. Originally designed to serve the practices of ethnic segregation under colonial rule, Chinatown grew rapidly to house nearly one-third of the colony’s municipal population within its limited expanse of two square kilometers (C. K. K. Tan 2015). Singapore’s strategic location as a colonial port, its rapidly growing population, and its position as a hub of the sex trade (Warren 2003), among other factors, affected the character of Chinatown. Anthropologist Chris K. K. Tan notes that it “offered gaudy temples, brothels, gambling houses, and opium dens,” leaving it “queered ... from the very start” (2015, 2208). This character persisted well into independent Singapore, until the Urban Redevelopment Authority embarked on a project to transform the district between the 1970s and the 1990s. It was this transformation that allowed for the formation of what has unofficially become the gay neighborhood in the city-state of Singapore. This neighborhood
exists in contradiction to the Victorian laws and morality of the postcolonial city-state, which still criminalizes homosexuality.

**HONG LIM PARK: A CENTER OF LGBT DISSIDENCE**

Located in Chinatown, Hong Lim Park is Singapore’s first privately owned public garden, with a long history, encompassing even the period of Japanese occupation from 1942 to 1945. Responding to the need for liberalization, the government designated the park as Speaker’s Corner in 2000, relaxing rules regarding public assembly and address, thereby creating an official venue for dissent. Yet the park has had a longer history of dissidence. Hong Lim Park was an important cruising ground for gay men who did not fit the cultural demarcations of the Bugis Street and the Orchard Road scenes. The noted Singapore LGBT activist Roy Tan, in a photo essay documenting Singapore’s gay past, says that Hong Lim Park was a cruising ground during “the night-time for more than half a century” (2012, 120). Elderly Chineseeducated gay men and married men were its most frequent users until the 1990s, when the park was gentrified.

Extending its role as a site of LGBT dissent, Singapore’s annual Pink Dot event has been held in Hong Lim Park since 2009. Pink Dot was born from the earlier Pink Picnic at the Singapore Botanic Gardens and the desire for Singapore’s own pride parade. Pink Dot was a reformulation of Singapore being nicknamed casually as the little red dot by the former president of Indonesia, Bacharuddin Jusuf Habibie (1936–), and the nickname soon became adopted as an affectionate moniker for the nation by Singaporean politicians (Chua 1999). Pink was adopted as the color of the event both for its LGBT symbolism and because of its association with the pinkcolored Singaporean citizens’ identity card. Therefore, while spatially and politically bound within the legalities of Singapore, the park has traversed the curtailments imposed on LGBT Singaporeans. Hong Lim Park is a site steeped in Singaporean LGBT history, where the illiberal pragmatics of the law is instrumental in circumventing the sociopolitical proscriptions on dissident sexual minorities.

**BIBLIOGRAPHY**

*J. Daniel Luther*
Chinatown has been central in the imagining of a gay community in Singapore. Activist Russell Heng (2001) outlines the emergence of Singapore’s gay movement from the 1950s into the 1980s. Heng’s account, along with those of a few others, such as Roy Tan’s (2012), relies on a positivist interpretation of the development of a gay community in the latter half of the twentieth century. In both Heng’s and Tan’s accounts, one of the earliest recollections of what Heng calls a “gay scene” in Singapore was associated with Bugis Street. According to Audrey Yue, Bugis Street was “an area in Chinatown that was an icon of the exotic Far East” (2012, 7; see also Heng 2001, 81), where cross-dressers, or the *ah qua* who worked in the sex trade, could be sought out. On the other side of Chinatown, Hong Lim Park has long served as a landmark in this imagining. Along with other streets around Bugis Street, such as Malabar Street, Malay Street, and Hailam Street, Hong Lim Park was a well-known cruising ground. Tan notes that it was the “first gay meeting place to be listed in the premier international gay tourist reference, the *Spartacus International Gay Guide*” (2012, 120).

Scholars and activists alike have noted Chinatown’s predominance as a veritable gay neighborhood in Singapore. Tan describes it as a “thriving ‘rainbow belt’ of karaoke lounges, nightclubs, restaurants, bars, hair salons, bathhouses and clothing and accessories stores” (2015, 2204). Its kaleidoscope of gay venues extends to mainstream venues and clubs in Chinatown, such as Zouk, which has hosted an annual “Butch Hunt competition” since 2001 (Yue 2007; R. Tan 2012). Many of these venues have hosted community meetings, sponsored advocacy campaigns, and built capacity for the movement. They have played host to monthly Sunday forums resulting in at least two major campaigns against police harassment of gay men in gay venues (L. J. Chua 2014). The Attic, a pub located above the Mox Bar in Chinatown, provided a venue for the Free Community Church, an accepting and inclusive place of worship for gay Christians. Many of the venues in this district continue to host theater and arts events, particularly during IndigNation, Singapore’s annual pride season.

**Singapore's Illiberal Pragmatism and Chinatown**

It is primarily thanks to what is known in Singapore studies as the *illiberal pragmatics* of governance that the contradiction of the rainbow belt in Chinatown exists. The notion of illiberal pragmatism derives from Beng-Huat Chua’s work on pragmatism as an ideological underpinning for Singapore’s model of governance. Herein, pragmatism is seen as an ideology that focuses on economic development emphasizing scientific and technological advances, as well as capitalist and industrial growth, all mediated by a “centralised rational
public administration” (B.-H. Chua 1995, 59; see also Yue and Zubillaga-Pow 2012). Within such a system, illiberal pragmatism is marked by discontinuities in governmental policies that are both “liberal and non-liberal” (Yue 2012, 5). Thus, for example, the Asian Values Campaign in the 1980s bolstered the rhetoric of an imagined community of a conservative Singaporean mainstream that gradually came to be increasingly opposed to later “measures of liberalisation” (Tan and Jin 2007, 186). Here, the earlier policies promoting family values to build a national identity find themselves in opposition to newer policies on cultural liberalization meant to bolster economic development through the creative industries outlined in the government’s 2002 policy blueprint (Yue 2007). Thus, for example, family values became the rallying call of a public sphere against issues around homosexuality, whether over the “homosexuals can change” banner in 2000 (Yue 2007) or the legalization of gambling in Singapore (K. P. Tan 2003).

The restoration of Chinatown and the eventual formation of its rainbow belt is an effect of the illiberal pragmatics of the Singaporean state. On the one hand, responding to the concerns of rapid westernization alongside speedy modernization, Chinatown, along with Little India and Kampong Glam, was to be conserved for its “historical and cultural value … as a physical bulwark against the perceived cultural ‘Westoxification’” (C. K. K. Tan 2015, 2208). On the other hand, the pressures of neoliberal development meant leaving the actual redevelopment of Chinatown to private capital with “a free reign over actual building usage” (2208). As a consequence, Singapore’s gay district emerged within a narrow spatial geography but with a complex symbolic imbrication of national pride, cultural difference, and dissident desire. By 2003 the city-state had become a popular venue for over “ten thousand local gays and lesbians, as well as regional homo tourists” (Yue 2007, 149), who arrived for the successful annual gay and lesbian Nation Party, a protest party held around National Day (1 October). Singapore had begun to be hailed as “Asia’s new gay entertainment capital” (Yue 2007, 149; see also Lim 2005). The protest party, like the gay district, was an expression of these factors.

The dynamics of Chinatown as Singapore’s unofficial gay district, born of the commingling of dissident desire, national pride, and cultural difference, need to be situated within the historical background of the city-state. This background is essential to understanding both the workings of Singapore’s illiberal pragmatism and what has variously been called the queer movement’s strategy of pragmatic resistance (L. J. Chua 2014) or survival (R. Tan 2012).

**Singapore: A Brief Context**

The city-state of Singapore has been variously labeled “non-democratic” (Huntington 1991) and an “illiberal [or non-liberal] democracy” (Bell et al. 1995; B.-H. Chua 1995). This perspective historically situates the context of Singapore’s transformation from a small fishing village into a bustling colonial trading port that gained independence in 1965.
Singapore’s particular geopolitical context as a postcolonial island city-state entailed its inheriting of various colonial apparatuses of governmentality, including antisodomy laws and fierce anticommunist suppression on the Malay Peninsula. Singapore’s ruling party, the People’s Action Party (PAP) (which remained in control of the government as of 2017), was faced with the monumental task of building a city-state with no natural resources, including even a dearth of potable water. In addition to its turbulent engagement with communist and labor parties within the larger geopolitical milieu, Singapore also had to contend with race riots during the 1960s as a nascent multireligious, multiracial, multiethnic city-state. Furthermore, because it was dominated by an ethnic Chinese majority population in a Malay-dominated region, the Singapore government needed to walk a fine line in order to carve out a prosperous economic hub, a cohesive nation, and a peaceful society.

Singaporean Government and Dissent

In negotiating these various divisive forces, the ruling party (still forming the government) adopted many of the repressive tools of the colonial British government in suppressing dissent. One of these tools was the Internal Security Act (ISA), which was used by the colonial British government against communist insurgents at the peak of the Malayan Emergency in the 1950s. Prior to independence, the PAP was one of the voices protesting the ISA. However, soon after independence, and to secure its own power, it deployed the specter of internal security against all forms of dissent. This included communist rivals within its own ranks, Chinese and Malay media organizations affiliated with trade unions and opposition parties, and members of the government accused of receiving foreign funding, as well as social activists, community organizers, and, more recently, organizations with links to terror networks. Besides the ISA, the government strictly monitors public assemblies, stringently issues permits for protests, and has made use of the Sedition Act to curtail public speech that might incite racial or religious tension. Similarly, it controls the media through the Broadcasting Act and the Newspaper and Printing Presses Act. Rather than resorting to physical violence, the government deploys the letter of the law to “suppress and control dissent” (L. J. Chua 2014, 35). This reliance on rule through law becomes the first obstacle to any dissenting tactic in Singapore. It affects the registration and organization of societies or companies, the gathering and meeting of activists, and the championing of rights over and above those sanctioned by the state.

Furthermore, as Jothie Rajah demonstrates, the state reconfigures “the profoundly liberal concept of ‘rule of law’ into an illiberal ‘rule by law’” (2012, 267) by manipulating the three branches of government. Rajah examines how the Vandalism Act, for instance, was passed in 1966 ostensibly to demonstrate the rule of law but in fact corresponded to the curtailment of the already diminished opposition party (then the Barisan Socialis). Similarly, the Newspaper and Printing Presses Act of 1974 was used to curtail the Chinese-
language newspaper *Nanyang Siang Pau*, while the Legal Profession (Amendment) Act curbed the Law Society’s critique of the government. Rajah traces the continuation of this process into the twenty-first century since the 1991 Religious Harmony Act (which prevented religious groups from engaging in social justice activism) and the 2009 Public Order Act were used to further rein in opposition protests on the streets.

It is in this context of the tightly managed nationstate that Singapore’s dissenting gay rights movement needs to be situated. Within such a framework, and as part of a movement formed of citizens who have grown up in such a milieu, Singapore’s LGBT dissenters have been persistent, tenacious, and creative in addressing the state’s colonial hangover, which infects not only its laws but many social norms. Singapore is the only ex-British colony to have repealed the British antisodomy laws (in 2007), which had been reworked into more specific laws targeting gay men. Thus, Section 377 of the Indian Penal Code became Section 377A, introduced in 1938 (*Sanders 2009*). While Section 377 of the Penal Code deploys archaic regulations from the ecclesiastical laws of early modern England to criminalize “carnal intercourse against the order of nature,” Section 377A specifies “gross indecency” among men (*L. J. Chua 2014, 38; Tan and Jin 2007, 185*).

In an authoritarian state such as Singapore, where the rule of law is coterminous with the rule by law, how has its dissident gay movement survived and struggled? The final section of this entry looks at the strategy of what Lynette J. Chua has called “pragmatic resistance” in the various campaigns against both the criminalization and the social ostracization of sexual minorities.

**Pragmatic Resistance: Singapore's Gay Movement**

While inconsistencies in government policies stemming from illiberal pragmatics facilitated the creation of Singapore’s unofficial gay district, it was repressive events in 1993 that led to Singapore’s earliest documented dissident retaliation. In May 1993 plainclothes police officers raided the club Rascals, located at the Pan Pacific Hotel. Police detained several gay men who did not carry identification and compelled them to squat outside the Beach Road Police Station (*L. J. Chua 2014*). One of the patrons of Rascals that night, a lawyer, wrote a letter to the police and the Ministry of Home Affairs, citing the relevant statutory provisions challenging the credibility of the detention. His assertions, based on Singaporean law, challenged the authority of the police to detain a person for not carrying their identity card without cause. The letter stated:

> It is particularly disturbing to find Singapore law enforcement officers behaving rudely towards and verbally threatening citizens who have not committed any offences. It would also be in the public interest to clarify the legal powers of
Not only did this letter prompt an unexpected response from the authorities, it signaled a turning point in the strategic resistance mounted by groups of dissident sexual minorities in Singapore. In essence, the letter sought to clarify the law, not directly challenge the police actions. Its wording carefully seeks this information in the “public interest” and under the broader ambit of causing harm to “citizens who have not committed any offences.” Not only does the letter then move to curb the excesses of the police, which as Chua notes include public humiliation and verbal threats, but it does so without mention of discourses external to the context of Singapore in the 1990s. Rather, it seeks to use the letter of the law against the very enforcers of the law.

It is the strategic use of law, with carefully mediated moves and countermoves, that Chua terms pragmatic resistance. She defines this as a context-driven, ground-up struggle against the repressive mechanism and apparatus of an authoritarian state. This dissident strategy, while more broadly aimed at rights and equality, is also chiefly concerned with survival. It emphasizes the need to strategically adapt to the political context, even if it means shying away from tactics that might compromise the survival of the movement. Chua argues that “the tactics of pragmatic resistance aim at immediate gains that change practice and informal policies, not formal laws and regulations” (2014, 17). The letter in the Rascals incident targets social discrimination by state actors outside the purview of the law, and as a nascent first step it was to become exemplary in the dissident strategy in Singapore.

A few other key moments demonstrate the adoption and utilization of this strategy by the gay movement in Singapore. These include the second attempt, on 25 February 2004, at registering People Like Us (PLU) as a society following statements by the prime minister and senior minister on international platforms nodding toward tolerance of gay and lesbian Singaporeans. The second attempt at registration was not made with the hope of success but to expose the government’s hypocrisy and prevent it from using homosexuality to further its neoliberal agenda. Activist Alex Au describes the second attempt as a “‘heads I win, tails you lose’ kind of situation” (L. J. Chua 2014, 91), implying that both the successful registration of PLU and preventing the co-option of homosexuality were desirable outcomes. The events surrounding Josef Ng’s 1993 performance of Brother Cane mark another exemplary instance of pragmatic resistance.
Documentation of Zihan Loo’s Performance Piece Cane (2012). Artist Zihan Loo reenacts performance artist Josef Ng’s Brother Cane (1994) where he strikes bags of red dye resting on top of blocks of tofu with a rattan cane to protest the entrapment and arrest of twelve homosexual men in Singapore. Six of the twelve men pleaded guilty and were given a jail sentence of two to six months and three strokes of the cane each. Ng’s performance led to a ten-year restriction of the licensing and funding of performance art in Singapore.

Josef Ng’s Brother Cane and Zihan Loo's Cane

Strategic dissidence in Singapore has its strongest examples in the sphere of performance art. While performance art in Singapore has been a prominent cultural form receiving the largest share of funding from the government, it has also been subject to severe censorship and repression. In order to bolster Singapore’s status as a financial and economic hub, but also to counter the negative international perception of the city-state as “puritanical” and emblematic of a “philistine modernity” (Wee 2003, 85), the government embarked on a cultural policy to encourage the arts in the 1980s. By this time, there already existed a theater scene that courted state repression for its dissident performances. Kuo Pao Kun (1939–2002), an important figure in Singapore theater, was detained without trial in the late 1970s for his alleged communist activities. Often critically engaging with Singapore’s “top-down disciplinary modernisation” (Wee 2003, 86), theater performers challenged the state’s policies on several fronts, including politics, gender, identity, and ethnicity, thus inviting increasing repression.

In 1993 repression turned its ire on gay dissident protest performance when twenty-one-
year-old performance and visual artist Josef Ng invited severe state backlash against his protest performance titled *Brother Cane*, a rendering of the entrapment, arrest, and caning of twelve homosexual men in Tanjong Rhu ([Peterson 2003](#)). As part of the performance, Ng placed twelve news cuttings of a *Straits Times* article titled “12 Men Nabbed in Anti-gay Operation in Tanjong Rhu” on twelve tiles under twelve blocks of tofu and bags of red dye. He then performed a dance, rhythmically striking the floor with a rattan cane and whipping the tofu blocks and red dye with the cane, causing the tofu and dye to splatter across the stage ([Langenbach 1997](#)). The performance culminated with the scattering of cut pubic hair over the central tile, symbolic of Ng’s “silent protest” (see [Cane 2012](#)). The performative cutting of pubic hair was strategic, done in near darkness, with the performer’s back to the audience. It relied on an inference, and even as the audience attempts to piece together what had happened, the entire mise-en-scène “was plunged into total near darkness” ([Ho 2017](#)). Ng ended the performance by smoking a cigarette borrowed from a member of the audience and declaring “sometimes maybe silent protest is not enough,” stubbing out the cigarette on his arm.

Ng's performance incited a flurry of sensationalized media coverage, while politicians and government functionaries condemned Ng and his work. Ng was protesting the humiliating tactics of the media, as well as the excessive penalty levied on the twelve men, who were subject to caning despite pleading guilty to charges of solicitation and being fined. The National Arts Council (NAC) condemned the performance, calling it “vulgar” and “distasteful,” and withdrew all forms of support. The Ministries of Home Affairs and Information and the Arts issued a joint statement in January 1994 banning Ng and fellow performance artist Shannon Tham from “future public performances” ([Cane 2012](#)) and imposing stringent restrictions on performance art. Ng was charged with committing an obscene act in public.

Although the ensuing clampdown and media furor forced performance art in Singapore to adapt, compromise, and even bend to the rules being laid out by the government, *Brother Cane* had a lasting impact. The performance dramatized state violence and the use of excessive force in the whipping of tofu blocks, and through the subsequent lawsuits, it evoked a public demonstration of the state’s illiberal rule by law. The NAC and the government ministries also realized the inadequacy of the law on which to “draw the line” with regard to performance art ([Cane 2012](#)).

*Brother Cane* demonstrated the failure and limits of Singapore’s rule by law though the evocative use of near darkness to hide the entire scene. “The flash of light piercing the darkness was a newspaper photographer” ([Loo 2017](#)) who captured a barely clothed Ng facing away from the audience, leaning slightly and looking down. A video recording by Ray Langenbach of Ng’s original performance, used in Zihan Loo’s 2012 re-creation of Ng’s work, titled *Cane*, indicates that the mise-en-scène was nearly dark; Ng’s actual actions were not visible. The photographer’s flash, visible in the recording, had illuminated and
captured the scene. The act itself was not designed to be discernible or clearly visible.

Loo's *Cane*, in contrast, is performed under the harsh glare of bright lights. Loo (2017) meant for the performance to be “overexposed,” with the lighting “almost blinding.” Loo explains that the choice of lighting and its total contrast to the pervasive darkness in Ng's performance was intended to extend the moment of the photographer's flash. Loo's re-creation has two notable and powerful deviations from Ng's performance. The first is to deny the media and the law a “‘live’ snipping of pubic hair” (Loo 2012), challenging the law for its eroticization and the media for its sensationalization of a moment they constructed for their own purposes. At the same time, the performer is completely shaven and entirely nude at that point in the performance. He makes direct eye contact with the audience, as though challenging the gaze to locate the obscenity for which the state came down so heavily on Ng and Tham. In a second deviation, Loo cites government regulations about smoking indoors and exits the performance venue to perform the stubbing out of the cigarette. In this moment, the performer encounters the frenzied photography of the lurking press.

Here pragmatic resistance embarks not on challenging the archaic colonial laws that criminalize homosexuality, but on confronting the varied and diverse sociopolitical assemblages of homophobia. These assemblages—the gaze, the construct of obscenity and vulgarity, the sensationalization and eroticization of a sexual minority as spectacle, foreign, and un-Asian—are all simultaneously provoked and challenged. In the process, the performance does not fall afoul of legal requirements and, in fact, cites them for ironic effect.

Finally, Loo claims during the performance that his “main interest in the re-performance of this piece lies in using [his] performing body to recuperate the public memory of *Brother Cane*” (Cane 2012; Loo 2012). In accordance with this recuperation, the performer allowed the audience to record, tweet, and photograph, as well as live telecast and document the performance. In doing so, lifting “the usual rule in cinemas and theatres” (Loo 2012) regarding recording at the beginning of the performance, Loo reclaims the right to public memory from the strictly controlled domain of the media.

Al-Dizil (1994; Thani al-Suwaidi)

WILLIAM MAYNARD HUTCHINS
Department of Philosophy and Religion
Appalachian State University, Boone, NC

A transgender Arabic novella.

Al-Dizil (1994; The Diesel [2012]), by the Emirati poet Thani al-Suwaidi, is a rare twentieth-century Arabic language work of fiction with a transgender protagonist. First published in Beirut in 1994, this novella was also republished there and in Baghdad and Cairo. The story’s frank and sympathetic portrayal of a transgender person made it notorious in the Arab world, and for several years it was unavailable in al-Suwaidi’s own country of the United Arab Emirates. Since then it has gradually gained recognition as an important work of Emirati literature based on both its daring approach to a taboo subject in a conservative society and its innovative, poetic language.
SOURCE: ANTIBOOKCLUB

Cover of The Diesel, English Translation of the Arabic Novella al-Dizil. The cover of the English translation of al-Dizil combines a vintage photo of a child of indeterminate gender in front of a Gulfport with an upside-down image of a desert, drawing on the novella's major theme of gender fluidity in an Arab society turned upside down by cultural transition. Noticeably absent is a lurid image of an Arab drag queen, indicating the novella's sympathetic, nuanced portrait of a trans character.

Reflecting the author's background in the poetic medium, al-Dizil is a long prose-poem that relies heavily on folkloric fantasy that at times is divorced from reality, leaving the events narrated by the protagonist, who is known as “the Diesel,” open to multiple interpretations. The narrative has a dreamlike feel that, while not exactly stream-of-consciousness, is “deliberately disjointed to present the contemporary Arab experience in a portrait that reflects a self that is split between an image of the past and an image of the consumer-oriented present” (Nur al-Din 2011; translation by William Maynard Hutchins). In a 2004 interview, al-Suwaidi stated that the theme of the novella is the effect of the petroleum age on a community—in this case, a rural village in the emirate of Ra’s al-Khaymah—at a crossroads between two cultures. As noted by William Maynard Hutchins in the introduction to his 2012 English translation,
The earlier culture was supported by relatively small-scale, artisanal production and embraced a system of values that fit such a culture. The character of the Diesel represents the second culture, which projects the more bohemian demeanor of a modern-day jinni who has emerged not from a fancy flask but from an oil well. The author hoped that the reader would discern the impact of this new culture on a society that was initially unprepared for it and that was therefore shaken to its core by it.

(14–15)

Thus, the Diesel can be viewed as a jinni, and that jinni in turn can also be thought of as oil.

The basic plot describes the Diesel’s dawning awareness of a transgender (male-to-female) identity and the flowering of that identity when the protagonist becomes a singer and dancer in a dance troupe that transforms life in a sleepy Arab/Persian Gulf fishing community. The story is narrated by the Diesel to another character, whose identity is not specified except that he is male and a childhood neighbor of the protagonist. “The Diesel” is the protagonist’s stage name as a singer and dancer with his sister’s otherwise all-woman ensemble. This name is derived from the protagonist’s sinuous dance moves but—as the author explained—also suggests that the protagonist represents petroleum and its jinni-like transformation of the Arab/Persian Gulf from a sleepy, superstitious, closed society to a global powerhouse (al-Suwaidi, 25 October 2011, Hutchins).

**Plot Summary**

The Diesel recounts a series of life experiences that brought him to a realization of his identity both as a performer and as a transgendered person. The Diesel’s first sexual experience occurs as a teenager when he is raped in a mosque by a wayfarer, who then spends a week sharing a room with the Diesel at the invitation of the Diesel’s father. Far from describing the experience in traumatic terms, the Diesel states that “this man was magnanimous and provided me with more paternal affection in a week than my father ever had” (al-Suwaidi 2012b, 42). This experience stands in contrast with a more traumatic later episode in which the Diesel’s father and his father’s friend pressure the Diesel to have sex with an elderly woman “to prove what studs they were by having me screw a seventy-one-year-old woman” (56). When confronted with the woman, the Diesel cannot perform the act, stating, “I wavered, conscious of a need to demonstrate my father’s virility but also of my inability to obey his body’s command” (56). The Diesel returns to his father with the deed undone.

It is in the company of women that the Diesel finds an identity rooted in the feminine. At the age of eighteen, the Diesel begins to associate with the widows and divorcées who are
friends with his sister. He states, "We bonded as if we were family, even though there was a gender difference; their bodies were differently configured, that was all" (43). One woman in particular attracts him sexually: "When I saw her, I felt masculine desire lead my body toward another instinct that reminded me of that wayfarer" (43). This moment of heterosexual arousal leads to his memory of homosexual activity. The Diesel then examines his body and determines to "configure this body in a novel fashion to return the man to his original memory" (43), which, to the Diesel, is the feminine identity: "Woman is our original format" (80).

The following day, the Diesel attends a wedding for one of the widows. Traditionally, Arab men and women celebrate separately at weddings, but at this wedding, the Diesel is invited to sit with the women by his sister. Although this gender transgression is at first greeted with hostility both by the men and the women in attendance, the Diesel's reception is transformed when he is invited to dance by one of the women: "When I looked at that woman I felt my hips twitch, and then I was dancing across the floor.... I felt for the first time that I possessed a woman's body and could no longer be able to resist this feminine force" (44). The rapture of the dancing causes him to experience a vision of his dead mother that convinces him she is still alive. When he tries to convince his father and sister of this, his father forces him to see a Sufi saint to cure his madness. As the holy man begins to read from the Qur’an over the Diesel, the Diesel experiences an awakening as an artist: "I don’t know what came over me after this faith healer recited over my head, but the idea of singing began to dominate my thoughts" (47–48).

The Diesel eventually joins his sister's all-woman troupe, initially serving as the women's escort but then joining them as a singer and dancer: "I began to train my voice for a different type of singing, one the town hadn't heard before" (67). His first performance at a wedding surprises everyone: "The baffled males, with their virile scent, surrounded me, while the women looked at me defenselessly" (67). But as the Diesel continues to perform at other weddings, he becomes a sensation in the town. He sets up a cabaret in his home and quickly becomes the artistic director to a large ensemble of performers.

When the troupe's popularity soars, the Diesel reports that his voice supplanted that of the muezzin in the community: “I was the voice that changed many things in their lives” (69). The members of his troupe “became the town’s kings, who could make it rejoice or weep” (70). The Diesel has challenged a local, repressive version of Islam, not by being trans but by entertaining people with new music.

A recurring nightmare, however, warns him to abandon his career. When the Diesel refuses, he is beaten in the nightmare, which leaves him crippled in his waking life. He is confined to bed for three months before a local ruler prevails on him to sing at his daughter’s wedding, to which the Diesel is carried on a litter. His return sparks even greater devotion that threatens the power of the political rulers.
The Diesel's popularity inspires local rulers to fund their own song-and-dance troupes. When these cannot compete with the Diesel's ensemble, the rulers ban this form of musical entertainment. In response to the ban, a huge protest gathering is organized at an outdoor venue. The Diesel is feted as the guest of honor at the gathering; he is seated on a special chair, and several people pay tribute to the impact his art has made on their lives. The gathering becomes a huge dance party, at the climax of which the people unanimously vote the Diesel as their president. The Diesel feels the weight of such a responsibility, acknowledging that he is “obliged to rescue this nation” (84). Yet his reflections on his new public role lead him to a more personal reflection on the friend who has been listening to his story. In the novella’s most explicit expression of homoeroticism, the Diesel tells his friend, “Then I longed ever so much for your body” (85).

The novella ends, interestingly, with the Diesel once again encountering the wayfarer, who does not speak but instead points the Diesel toward the mosque. The Diesel’s response suggests that, despite the subversive role he has played in the community, he has not abandoned the religion of Islam: the last line of the novella is his directive to his friend to “rise and give the call to prayer” (85).

**The Innovations of *al-Dizil***

*Al-Dizil* is not the first work of modern Arabic fiction to treat an individual’s coming of age as representative of the transformation of an Arab society in the twentieth century (see, e.g., *Return of the Spirit* [2012], by Tawfiq al-Hakim). It is also not unheard for an author to provide a sympathetic portrayal of a queer character (e.g., *Sugar Street* [1992], by Naguib Mahfouz). What is unusual about *Al-Dizil* is that the protagonist is conscious of being transgender without feeling angst. By contrast, as Hanadi Al-Samman (2015, 182) has pointed out, the transgender character Khalil in Hoda Barakat’s novel *The Stone of Laughter* (1995) “discovers there is no space for ambiguous feminized masculinity in this combative society.”

Even if the character of the Diesel represents both a developing artist and the transformative power of petroleum, his disruptive transformation is not demonized in this novella. As the Diesel finds his voice as an artist, he becomes the popularly elected president of his people. And although he has drawn the townspeople away from the mosque, at the close of the novella his directive to give the call to prayer demonstrates that his rebellion is not against Islam, properly understood.

Equally innovative is *Al-Dizil*’s use of fantastic elements in the telling of the story. Rather than imitating nineteenth-century European novels, al-Suwaidi channels popular Arab storytelling, the best-known example of which is *A Thousand and One Nights*. Al-Suwaidi uses fantasy, based in the oral tradition of fantasy storytelling, to lend a spirit of subversive transformation to the narrative. One example is his blending of human and animal in his
characters so that the line between the two is blurred. At one point in the novella the teenage Diesel is working for a sorceress in an ancient castle and is upset that a black dog keeps drinking from his milking pail; when he brings this to her attention she tells him, “Let him drink as much as he wants ... he’s my husband” (63). This is reminiscent of the story of the two brothers who were turned into dogs in the second old man’s tale on the second night of *A Thousand and One Nights*. He says his two brothers were punished by his wife’s sister for trying to kill him and his wife (*Lyons and Lyons 2008*).

Just as al-Suwaidi blurs the binary line between human and animal, he also uses fantasy to blur the binary line between male and female. For example, a group of thieves steals the Diesel’s father’s catch of squid and is observed by both the Diesel and his sister. The Diesel’s sister identifies the thieves as “spiders in human form,” a deliberately ambiguous phrase that is open to interpretation by the reader as to what manner of creature they really are. Not only is their physical form undefined, their gender is equally ambiguous, as the Diesel observes: “They had rejected their masculinity, adopted a feminine argot, and moved their bodies as if responding to deep impulses” (29). These gender-ambiguous creatures start circling the Diesel, who at this point is a child, and they utter a prophecy over him about his gender identity: “They placed their hands on my head, like a man blessing his wife.” They told him, “Since you haven’t been able to defeat your spirit, you must defeat your body” (30).

This prophecy is a reference to the dissonance within the Diesel, who in body is male but in spirit is female. In a reasoned study of interactions between gender, law, and medicine in contemporary Iran, Afsaneh Najmabadi (*2014*) attributes a position on trans status such as that expressed by the Diesel to Hujjat al-Islam Karimi-nia, a transgender-friendly Shi’a cleric. For both the Diesel and this modern Shi’a scholar, the soul is decisive; the body’s configurations are secondary. A transgender person’s experience, then, is related to “the lack of correspondence between gender/sex of soul and body” (*Najmabadi 2014, 178*). For Karimi-nia, then, a transgender person’s efforts to reconcile this dissonance by undergoing surgery to make the body conform to the gender of the soul should be supported, not condemned, provided he does not engage in same-sex sexual activity prior to the transformation. Najmabadi (*2014*) admits being puzzled by the hard line that Kariminia felt compelled to draw between homosexuals and transgender people, with the former being unacceptable and the latter acceptable. At the end of *Al-Dizil*, the expression of longing for the body of his friend shows that the Diesel as a character does not draw a hard line between transgender and homosexual desires. It could be argued that in this novella gender is a fluid rather than a rigid category.

**Reception**

Fatima Ahmad Khalifa, a literature scholar from the United Arab Emirates, wrote that in *Al-Dizil*, al-Suwaidi “personifies place and breathes his spirit into it so that place, time, history,
and the character constitute a single whole” (quoted in Hutchins 2012b, 19). In a profile of al-Suwaidi in Arabic, the critic Muhammad Abu ʿArab wrote that in Al-Dizil “he kneads poetry together with prose” (2013; translation by William Maynard Hutchins)—rather than narrative with folklore. In a 2012 review of the English translation, M. A. Orthofer wrote the following: “Elliptical and poetic, The Diesel is not a straightforward text. It appears to arise out of not simply a different culture but also a different writing-tradition—its orality also emphasized by the fact that much of the text is directly addressed to a neighbor and ‘mute friend’ (i.e., also the reader) as if in conversation.”

In a review of The Diesel for Three Percent, Lili Sarayrah (2017) called it “the shortest and most experimental Arabic text I have ever read.” She concluded her review, saying, “This novella undoubtedly deserves attention for its highly unique execution and relevant subject material, and I would unhesitatingly recommend it to anyone.” Alan Cheuse in his 2012 review for National Public Radio summarized the protagonist as follows: “He/she is a djinn or demon born of the vast oil deposits beneath the Middle Eastern sands and then born into a fisherman’s family on the coast of the Emirates, born as a transgendered child who grows up to become a highly praised musician and performer.” He went on to say that “the story unfolds in a series of vertiginous riffs, on childhood, on village life, on commerce, on government, on the power of music, ... producing a sort of Arab surrealism with a deep foundation in local folklore.” In his summation of the work, Cheuse said that “this little work of fiction, with its wild metaphors and surprising turns, seems as tipsy as a dancer with too many drinks. It celebrates the Dionysian element in Arab culture we’ve seen much too little of these recent decades.”

Drag, Asian

KAREEM KHUBCHANDANI
Assistant Professor, Department of Drama and Dance and the Program in Women’s, Gender, and Sexuality Studies Tufts University, Medford, MA

The various forms of Asian drag, their reception in Asia and elsewhere, and their cultural impact.

Queer and trans Asians on the Asian continent and in the diaspora aestheticize gender for the purpose of entertainment, combining multiple performance traditions and historical references to simultaneously invoke community and perform social criticism. As highly visible figures—visible because of theatrical gender expressions, online circulations, and staged performance at festivals, pageants, nightclubs, and parties—Asian drag artists draw on a variety of cultural references that speak to numerous audiences at once. By employing syncretic aesthetics, their performances work in multiple registers that simultaneously engender familiarity, pleasure, and sociopolitical criticism. The performers examined here under the label of “Asian drag” occupy several gender categories—including gay men, otokoyaku, drag kings, hijra, bakla, kathoey, and trans women—and manipulate their femininity and masculinity through staged performance for a variety of reasons: fund-raising, global citizenship, diva worship, income raising, play, entertainment, pleasure, and self-actualization.

To make sense of Asian drag’s critical possibilities, it is necessary to consider how gender, sexuality, and race have been policed, colonized, and disciplined (by Euro-Western imperialism, intra-Asian colonization, and statesanctioned hegemonies) to name how artists invoke and/or interrupt norms. Asian drag must be studied in context, differentiating kathoey dancers from diasporic South Asian drag queens, from Japanese women performing in masculine roles in all-female revues, and so on, as their identity positions and aesthetic techniques both have and summon different histories.

ASIFA LAHORE

Asifa Lahore, who calls herself the United Kingdom’s first out Muslim Pakistani drag queen, is a performer, internet celebrity, and activist. Her involvement in the queer British Asian community includes working at the sexual health and advocacy organization NAZ; hosting queer Asian parties such as Urban Desi, Club Kali, and Disco Rani; creating a series of music videos released on YouTube; and appearing on various talk shows to speak about her experiences as a gay Muslim. She famously stages her
Muslim and Pakistani identities by performing in a full burka, stripping into a sari, and subsequently revealing a miniskirt. In a Facebook video testimonial uploaded in May 2017, Lahore came out to her online following as a transgender woman.

Navigating the respectability politics of the Pakistani diaspora, the xenophobia of a United Kingdom on the cusp of Brexit, an Islamophobia intensified after the 2005 bombings in London, and long-standing racism and transphobia in the gay community, Lahore uses drag to stage politics and to perform her own resilience. In interviews, she emphasizes the widespread visibility (albeit ambivalent acceptance) of khwaja sirs (a state-recognized identity category in Pakistan that includes intersex and transgender people; Khan 2014) to argue that drag is not foreign to or abject in Asian culture and communities. She reiterates this logic in her own name, Lahore, the capital city of the Pakistani state of Punjab, inscribing herself into the nation of Pakistan, while embodying the postcolonial nation in the metropole. Her transition, her strategic references to transfeminine communities in Pakistan, her visibility as a drag queen, her purposeful costume choices, her use of online platforms, and her involvement in a variety of queer Asian communities demonstrate the ways that Asian drag artists complicate Western gender/sexuality matrices, enact social critiques, and build community for marginalized populations.

Performing Gender: Between Art, Culture, and Everyday Identities

Many drag artists manipulate normative aesthetics of masculinity and femininity to incite recognition, pleasure, and discomfort in audiences. For a variety of reasons, the gendered aesthetics of Asian drag are rendered illegible because of a variety of historical and political inequities. Euro-colonial constructs of Asian effeminacy render male Asian performers already feminine within transnational contexts. While Asian men often find themselves the least desirable in American gay nightlife spaces that privilege masculine self-presentation, the legibility of their bodies as already feminine allows them to succeed at drag pageants
that reward portrayals of femininity (Han 2015). At the same time, their competitors read them as having a naturalized advantage, thus dismissing their craft.

Furthermore, the legibility of Asian performance styles may not be read as “art.” At the 1998 Diva drag festival in Trinidad, performances by an Indo-Trinidadian couple enacting heterosexual couplings from Hindi and Indo-Trinidadian films did not receive the enthusiastic reception that other performances elicited (Puar 2001). The audience, reading their dances as “just” a performance of their ethnicity, perhaps lacked the intimate cultural knowledge to be moved by the dance’s content, and/or positioned Indianness as perpetually foreign and therefore relegated the performance to everyday Indian “culture” instead of a more sophisticated “interpretation.”

Such hierarchical judgments also play out within Asia. A Malaysian transgender performance troupe visiting India in 2004 during the World Social Forum was invited to perform at a party hosted by the social and activist group Gay Bombay, whereas local hijra dancers were not (Shahani 2008). Although hijras (a feminine gender identity in India referring to people assigned male or intersex at birth and ritually inducted into hijra kinship structures) are often photographed and filmed dancing (at festivals or weddings or in straight bars, for example), few scholars writing about hijras critically discuss the aesthetic or pleasurable quality of their dance (Morcom 2013). The Malaysian troupe’s “foreign” style of drag aligned them with the cosmopolitan aspirations of Gay Bombay (Shahani 2008, 251), evidencing hierarchies within local gender/sexual matrices and between Asian countries, bodies, and genders. This pattern repeats itself in the preference of queer and trans dancers in Bangkok for Korean popular music (K-pop) over Thai songs; one reason for their preference is the illegibility of foreign lyrics that allows dancers to focus on movement instead of words. These feminine Thai dancers draw on K-pop to embody more cosmopolitan visions of Pan-Asian femininity (Käng 2014). And yet, even K-pop celebrities perform femininity in queer ways (Oh and Oh 2017), requiring complex layers of analysis to make sense of inter-Asian appropriations of gender and popular culture.

While some scholars argue for a differentiation between drag queens and localized transfeminine identities (Bakshi 2004), one can see in the Gay Bombay example how some transgenders are welcome to perform as “drag queens” in gay male spaces, whereas others are not. More generally, Asian drag confounds the assumptions of drag as a gender “crossing.” Drag is popularly understood as a crossing of a masculine-feminine gender binary for the purposes of entertainment; indeed, some of the artists described here insist on being understood as men who exaggerate femininity for the stage. However, Asian drag does not always rely on binary crossings, given the varying, evolving, nation- and region-specific matrices of gender and sexuality across Asia (Käng 2012); gender categories such as bakla, beki, kothi, and kathoey invoke a variety of feminine male and transfeminine subjectivities and performances.
Thai drag queen Pangina Heals, a virtuoso of waacking (an athletic dance emerging from black LGBT communities in California) and hilarious emcee, is the alter ego of Pan Pan Narkprasert, who speaks of himself as a gay man. On Sunday nights in Bangkok, Heals hosts a party and drag show at Maggie Choo’s, an underground bar styled as a 1930s Shanghai speakeasy. Heals’s cast features not only drag queens performing for a cosmopolitan gay audience but also transgender women who know how to play into the global gay aesthetics of bawdy humor, camp, and glamour. Heals has also been one of the few drag queens to compete on the Thai reality TV show *T Battle*, which more traditionally invites transgender women to participate (Stein 2017). The recognition of *kathoey* (a Thai gender category typically referring to male-to-female transgender people) by Thai popular media opens up space for a gay queen to perform and become legible, and that queen then opens up spaces for performances by transgender women at the gay club night he hosts.

Asian drag can also include heterosexual men. Hailing from the north Indian city of Jaisalmer, Queen Harish is an exceptionally graceful dancer, carefully combining in his performances the kneeling spins of Rajasthani folk dance, daring Indian circus feats such as dancing on broken glass, and demure *abhinaya* (facial expressions) of Hindi film actresses. Harish has long loved to dance and made a career of it by donning women’s clothing, makeup, and jewelry to perform. Given both his skill and novelty, he was invited to travel with performance troupes outside India where he was received by fellow performers as a “drag queen” and thus acquired the title “Queen Harish” (Roy 2008). In interviews, Harish reminds audiences that he is married to a woman, has children, and regularly goes to the temple, meaning he complies with the Indian state’s heteronormative expectations. Performers such as Harish are no aberration, and he aligns with a long tradition of cross-gender artistry. Indian theater in the early twentieth century included male actors who dressed as women; these men enjoyed popularity on stage even when women could occupy the stage, and they even had their own fan followings (Hansen 2004).

Since Harish’s renaming and embrace of “queen,” he has been booked at gay events in the diaspora such as Desilicious in New York City, and he even refers to his art form as “drag.” Another performer at Desilicious, Bijli, describes herself as having a God-given feminine spirit (Malik 2003). While at the nightclub, she discusses wishing to be desired as a woman, not a gay man or a man in drag. While Desilicious primarily attracts gay men, Queen Harish and Bijli are two performers who might be interpreted by their gay audiences as “drag queens” but occupy quite different identities from each other, as well as from the gay men who constitute their audience. Asian drag thus draws from different gender epistemologies and performance genealogies but also allows for the coexistence, proximity, and overlap of multiple gender identities.

**Conversing with Religion, Race, and Nation**

For Bijli, performing at parties such as Desilicious becomes a way of expressing her
feminine spirit. Her invocation of “spirit” reveals that Islam is one of the lenses through which she interprets her gender and that dancing her gender constitutes a spiritual practice. For other queens, performing their religious identity might take a more politicized tone. In 2017 a drag queen named Tara Ryst started to perform at Desilicious parties. Her name, meant to sound like terrorist, plays with the racist assumptions—exacerbated exponentially after the 11 September 2001 terrorist attacks in the United States—placed on South Asian, Arab, and Muslim people (Rana 2011). Performing as Tara Ryst therefore becomes a way of subversively occupying the sexual and gender aberrance attributed to Middle Eastern and South Asian people that has been used to justify colonial violence (Puar 2007). At the same time, Tara Ryst’s clever song medleys and salacious dance and costume style please her audience with references to contemporary Pakistani mujras (a salon-style seductive performance; S. Khan 2017) and nostalgic Hindi films.

For baklas (a Filipino feminine gender identity referring to people assigned male at birth) living in New York, hosting a drag pageant becomes a means of writing themselves into religious tradition, staging their racial difference, and reframing their positionality to both the United States and the Philippines (Manalansan 2003). Staging the Filipino Catholic ritual of the Santacruzan not as a procession in the Philippines but as a fashion show in New York City in 1992, members of the community health organization Kambal sa Lusog reinvented the various muses traditionally represented in the procession. Instead of carrying the flag of the Philippines, the bakla Queen of the Flag wore a slinky and diaphanous dress in the flag’s colors, sexualizing a symbol usually associated with “virginal and maternal tropes.” Another bakla styled as Judith of Bethulia carried the head of George H. W. Bush, the US president, commenting both on the state of US politics and US imperialism spanning the occupation of the Philippines to the present.

Even within Asia, queer and trans performers employ drag to critique national and colonial politics. The Pink Divas, a group of gay, queer, and trans dancers wearing high heels, skirts, sequin blouses, and other feminine garb, perform annually at the Bangalore Queer Film Festival. Following the Supreme Court of India’s recriminalization of sodomy in 2013, the dance group included a sequence in which a drag queen with angel wings pulled a banana out of the pocket of an actor portraying a Supreme Court judge, then fellated and ate it. Section 377 of the Indian penal code is a relic of Victorian British law that criminalizes acts “against the order of nature”; it remains in the penal codes of several British colonies (Narrain and Gupta 2011). During the Supreme Court of India hearings, the judges were more concerned with debating what counted as acts against the order of nature rather than discussing the dignity and safety of gender and sexual minorities. The simulation of this sexual act by the drag queen ridiculed the conservative Indian judges’ obsession over perverse acts, as well as colonial law, much to the pleasure of the cheering audience. In September 2018 India’s Supreme Court once again struck down the application of Section 377 against acts of sodomy.
Alongside the legacies of Euro-Western imperialisms, intra-Asian colonization shapes the political and performative efficacies of Asian drag. In the case of otokoyaku (women performing male roles in the Japanese, all-female Takarazuka Revue), their debonair personas are determined to be in excess of modest Japanese masculinity. This exaggerated masculinity performed by women couples with caricatured performances of non-Japanese Others in the Takarazuka Revue to secure, via the stage, notions of a naturalized, quotidian, nontheatrical Japanese colonial masculinity (Robertson 1998). Interestingly, Taiwanese artists also use drag to respond to the legacy of Japanese colonization. Fanchuanxiu is a Taiwanese male cross-dressing genre that uses a variety of recorded music for its artists to lip-synch. Employing nostalgic enka tracks (Japanese ballads) alongside other Japanese signifiers, artists invite their audiences to ambivalently engage with the ubiquity of Japanese popular culture in Taiwan (Wu 2017).

**Popular Culture, Circulation, and Virality**

The American reality TV competition RuPaul's Drag Race (2009–) has provided an important international media platform for drag artists in the United States to stage their craft and their politics. Through sartorial choices—such as Kim Chi’s elaborate take on the traditional Korean hanbok dress and Manila Luzon’s Filipino flag dress and her pineapple outfit—the queens reflect their ethnic and national heritage (Zhang 2016). At the same time, Asian queens on Drag Race have turned to racial performances that do not necessarily reflect their own ethnonational heritage: riffing on the Japanese geisha, appropriating the Chinese cheongsam, styling themselves as Latina cholas (part of the Mexican American women’s hip-hop subculture), and modeling “African chic.” These Asian queens’ strange stylings are reminders of how recalcitrant Orientalisms flatten complex differences between Asians and limit the ways that Asian queens can present themselves as racialized subjects.

Beyond RuPaul’s Drag Race, Asian drag artists struggle to find similar global success or even a platform on which to perform. Narrative theater productions function as sites to imagine what Asian drag could look like if it were given room to thrive. The heterogeneity of Asian drag is enacted in plays such as The Gentlemen’s Club (Mumbai, 2015), about intergenerational tensions at a Mumbai drag king cabaret, and Miss Meena and the Masala Queens (London, 2017), about conflicts between South Asian queens in a British nightclub. While drag is associated with nightclubs, in India, middle- and upper-class gay nightlife largely bans “cross-dressing,” excluding both transgender people and drag artists. As such, artists such as Maya the Drag Queen look to the internet—TEDx, Instagram, and Facebook—as a platform to accrue audiences. Many Asian drag queens have “gone viral” online. A 2010 video of a bakla artist lip-synching Whitney Houston’s “I Will Always Love You” as a zombie haunting her lover has garnered millions of views. A 2007 video showing the collective choreography of Filipino inmates at the Cebu Provincial Detention and
Rehabilitation Center dancing to Michael Jackson’s “Thriller” has received over 58 million views and prominently features Wenjiel Resane, a feminine performer in a sea of male zombies (Perillo 2011). The Instagram uploads of Apichet “Madaew” Atirattana, in which he films himself in makeshift haute couture, evidence how online circulation becomes especially useful to young rural Asians who do not have access to the monetary resources expected of drag artists nor the urban nightlife associated with drag cultures.

For Mumbai-raised, Chicago-based drag artist Abhijeet Rane, web-based and live performances are mutually constitutive. The acclaimed Instagram photo series Bad Beti’s features Rane styled as twelve South Asian women and femmes who refuse(d) to conform to gender expectations. Following the popular reception of this photo series, Rane curated a party at Berlin nightclub in Chicago titled Bad Beti’s featuring Asian drag acts (Moran 2017). The performers (South Asian, Korean, Japanese, and mixed race) drew from a range of musical references to stage Asianness in this nightclub: from the Orientalist stylings of Madonna, to Disney’s Aladdin and Mulan, to K-pop, and video-game theme songs. The eclectic musical samplings lip-synched by the performers in Bad Beti’s provide a reminder that Orientalist visions continue to structure the perception and performance of Asian genders, but that Asian drag artists can use these familiar referents, as well as many others, to invite the audience into community and to critique the colonial discourses placed on their bodies.

Dyketactics!

PAOLA BACCHETTA
Professor, Department of Gender and Women's Studies
University of California, Berkeley

Dyketactics! is an anarchist, anti-colonial, anti-racism, and anti-capitalist collective of self-identified dykes of all colors, founded in 1975 in Philadelphia. Today, Dyketactics! is most renowned as the first LGBTQI+ group in the United States to take a city to court for engaging in police brutality specifically against LGBTQI+ peoples. However, Dyketactics! engaged in direct-action struggle on many other issues, too (Bacchetta 2009).

The members of Dyketactics! were black, indigenous, Puerto Rican, racially mixed, Filipina, white, Jewish (both white and of color), and Asian and thereby, for such a small group, somewhat reflective of lesbian populations in the United States. The members ranged in age from nineteen to thirty. The majority of Dyketactics! members were raised in working-class families, but the collective also included a few members from middle-class families. During the most active period of the group between 1975 and 1978, Dyketactics! members lived together collectively in two houses in West Philadelphia. Many of them also worked together at Alexandria Books, a collectively run nonprofit feminist and queer bookstore in central Philadelphia. The housemates and other members had met in LGBTQI+ and other social movements. Most members had come out of prior social movement formations that were not LGBTQI+ specific and remained closely aligned with them or simultaneously within them: black liberation, socialist, communist or anarchist, Native American, student, Puerto Rican independence, and more. Dyketactics! was part of the most radically critical wing of LGBTQI+ movements and of many other movements against colonialism and capitalism, including Native American and black liberation movements, the movement for Puerto Rican independence, and the workers movements of the day.

Dyketactics! v. the City of Philadelphia

The major Dyketactics! struggle against police brutality began when Dyketactics! members were brutally beaten by police at a queer labor rights demonstration on 4 December 1975. Dyketactics! had been called on by its communities to participate in a LGBTQI+ demonstration during an official meeting of the city council inside City Hall to demand that Bill 1275, a citywide bill that outlawed antigay discrimination, be passed. The bill had been
brought up for many years in city council and had been dismissed every time without discussion. With the hope of preventing this from reoccurring, many LGBTQI+ organizations came together to watch over the process. The plan was to sit in the public audience section of the city council meeting room with banners indicating a strong LGBTQI+ presence. The night before the session, Dyketactics! members had created two large banners: “You Will Never Have the Comfort of Our Silence Again!” and “Dykes Ignite.” That day, they marched together to City Hall and entered the building and then the council session room, holding the banners.

The council session room was filled with LGBTQI+ activists. It was also heavily attended by journalists. It was guarded” by Philadelphia’s Civil Defense Squad (CDS), a special militarized contingent of “riot police” in Philadelphia that had been created by the then right-wing mayor Frank Rizzo, who was formerly the police chief of Philadelphia. Midway into the meeting, the bill came up. The city council voted once again not to bring it to the floor for discussion. When that decision was announced, demonstrators began chanting “Free Bill 1275,” while Dyketactics! members lifted the group's banners. With the first cries, the CDS moved in, targeted Dyketactics! members one by one, and brutally beat them up. Sometimes it took four or five CDS men to control one Dyketactics! member. Dyketactics! members defended themselves but also fought back. The CDS men violently dragged wounded Dyketactics! members outside the session room, down a long hallway, and threw some of them separately into smaller rooms. Eventually most Dyketactics! members, albeit having sustained significant injuries, found their way into the same part of the hallway. Other Dyketactics! members arrived on the scene and raised a giant witch puppet that belonged to the theater group Bread and Puppets in which Dyketactics! had allies. Dyketactics! members began screaming shrill curses against lesbophobia, the bill, and the CDS, refusing to be stopped by the CDS violence. Soon the CDS members reassembled, formed a circle, moved in on the Dyketactics! members, beat them again, and then dragged them down Philadelphia City Hall’s four flights of stone steps. At that point, the most injured Dyketactics! members were rushed to the hospital.

Within one week, six of the Dyketactics! members who had been most severely beaten filed a lawsuit against the City of Philadelphia for lesbophobic police brutality. They wrote a press release to explain what had happened and why they were bringing charges. This was the first case ever in the history of the United States of LGBTQI+ people taking a city to court for police brutality specifically against queers. The Dyketactics! six plaintiffs were Paola Bacchetta, Sherrie Joyce Cohen, Kathy Hogan, Linda Norwood, Sharon Owens, and Barbara Lipschutz (later Barbara Ruth). The trial for the case known as Dyketactics et al. v. Fencl et al. (Dyketactics! v. the City of Philadelphia) took place in the fall of 1976. It received much press and television coverage. The trial became a spectacle of lesbophobia, as the CDS’s lawyers worked to discredit every Dyketactics! member and to construct the CDS members as heroes. But the trial was also a spectacle of dyke resistance. The “Dyketactics! Six” and other Dyketactics! members arrived together in court each day chanting and
singing songs of resistance. They sat together in solidarity in the courtroom. When it became clear that there was no chance to win the trial (and the lawsuit did end up failing), the Dyketactics! Six began to use the trial’s publicity to do political work for the LGBTQI+ community and communities of color. For instance, in their testimony, as well as in interviews, they included statistics about crimes against LGBTQI+ people and about police brutality against people of color. These points ended up in the media, reaching a large audience.

During and following the trial, as a result of the extensive publicity in the media, members were marked, followed, and persecuted by a whole range of parties. Many were harassed in the streets, on public transportation, and elsewhere in public spaces. Some were framed on false charges and in some cases incarcerated. One, Bacchetta, was pursued on false charges for supporting Assata Shakur, a black liberation movement political prisoner, and eventually ended up forced into political exile in France.

**Other Actions**

Dyketactics!’s political actions are too numerous to list here (for more information, see Ruth 2009; Bacchetta 2009). Across their many actions, Dyketactics! centrally denounced Native American genocide and the ongoing conditions of native peoples; antiblack racism and racist violence, deprivation of queer labor rights, violence against women, the racial politics of sterilization, inaccessibility of abortion and contraception, class inequalities, the capitalist and racist destruction of the environment and all living beings, and racism within the women’s and LGBTQI+ movements. Some examples of Dyketactics! actions include a series of direct-action protests at the 1976 Bicentennial held in Philadelphia, including radical dyke theater and a demonstration to denounce the Bicentennial as a colonial, racist, and misogynistic event; a Philadelphia citywide women workers general strike; solidarity work on behalf of the anti–Vietnam War political prisoner Susan Saxe and Shakur; the liberation and rehousing (back with their mothers) of children of lesbians awarded by the lesbophobic, heteropatriarchal state to fathers; a protest to support a lesbian high school student who was harassed at school; high-profile protests against snuff films in which women actors were abused and killed; support for the struggles of sex workers, including those mobilized by the well-known sex-worker activist Margo St. James; and the organization of an entire neighborhood by Dyketactics! members living in the collective Samson Street (West Philadelphia) to protest horrific housing conditions perpetuated by their common slum landlord.

Dyketactics! also worked creatively to construct dyke music, poetry, theater, and dyke spaces. Some members were part of the Philadelphia theater group Rites of Women. Most members did street theater together as part of Dyketactics! political actions. Indeed, in an early press release, Dyketactics! affirms that the collective was seeking to “ignite the imagination” of the LGBTQI+ community (Ruth 2009). The group’s writings were published
in Philadelphia’s *Hera* and other lesbian and feminist newspapers of the day, including *Lesbian Connection, Majority Report, and Off Our Backs*.

**Political Significance**

Dyketactics! was a path breaker in several areas. Historically, the 1975–1976 Dyketactics! trial marks the first time ever that LGBTQI+ people took the city to court for police brutality specifically against queers. Dyketactics! was against prisons, and therefore did not demand prison sentences for the accused police officers. Instead the group demanded that the city recognize police brutality against lesbians and other queers, and provide financial compensation that Dyketactics! would donate to struggles of the group’s choice.

Beyond the trial, another leading aspect of Dyketactics! was its development of a specifically lesbian- and queer-situated critical analysis of settler colonialism, genocide, slavery, racism, and capitalist exploitation. The group incarnated a heterogeneity of racialized, class, and gendered positionalities and worked toward the inseparability of LGBTQI+ liberation with all the liberation movements of the day. For Dyketactics!, every liberation issue was always already a lesbian and queer issue, and every lesbian and queer issue required an analysis in which colonialism, racism, and capitalism were central factors.

Locally, in Philadelphia, Dyketactics! drew links between relations of power, subaltern conditions and subjects, and the brutalities of police repression. The Dyketactics! trial became a coalitional site that brought together in the same space some of the most radical Philadelphia lesbian and queer activists of the day, including Tommi Avicolli Mecca (Radical Faeries and the Gay Liberation Front) and Cei Bell (black trans struggles).

**Afterlife**

After 1978, under the pressure of repression, Dyketactics! members were forced to disperse, and the group could no longer meet regularly. Many Dyketactics! members remain political activists and *artivists*, in Philadelphia, elsewhere in the United States, and internationally. For example, one Dyketactics! Six member, Owens, a legal assistant and longtime black movement activist, worked on the defense team of surviving members of the black liberation and anti–police brutality group MOVE, after MOVE’s group home was bombed from the air in 1985 by the Philadelphia mayor’s office, killing eleven members including five children. Hogan became a lawyer; she gathered and digitized the constitutions of all native nations in the United States and made them collectively available on the internet so that the nations could learn from each other how to strengthen their individual constitutions to better protect their sovereignty. She also engaged in a large amount of pro bono legal work for people in poverty. Barbara Ruth, a widely published poet, became a leader in the queer disability movement. Cohen, also a lawyer, walked on the Longest Walk organized by the American Indian Movement, remained active in
LGBTQI+ organizing, worked closely with black liberation movements and workers' unions, and twice ran for the Philadelphia city council. Bacchetta, a sociologist and professor in the Department of Gender and Women’s Studies at the University of California, Berkeley, published widely on social movements. She continued as an activist in decolonial queer of color and anti-racism movements in the United States and France.

Beyond the Dyketactics! Six, another member, Monica A. Hand (1952–2016), an accomplished poet and activist, was part of Cave Canem and Black Lives Matter. She was the author of *me and Nina* (2012) and *The DiVida Poems* (2018). Julie Blackwomon is a widely published poet and fiction writer. Some of her short stories appeared in her book *Voyage Out 2* (1990). She also continued to work with prisoners. Chea Villanueva became a fiction writer, publishing *Jessie's Song, and Other Stories* (1995) and the novel *Bulletproof Butches* (1997). Pauline Miriam became founder and owner of Hot Flash, a company that organizes massive parties for lesbians in major cities, thereby building broad community. Many Dyketactics! members continue to communicate almost daily thanks to a (private) Dyketactics! Facebook group. The collective also holds in-person group reunions in Philadelphia every few years.

St. Mary’s College of Maryland, St. Mary’s City

The intersection between LGBTQ and environmental activism.

A number of monographs and anthologies published in the first two decades of the twenty-first century attest to growing scholarly interest in bringing together queer and environmental studies (Mortimer-Sandilands and Erickson 2010; Seymour 2013). While gender is increasingly used as an analytic frame in discussions of climate change (see reports from the United Nations Environment Programme and the Sierra Club’s Gender, Equity, and Environment Program for examples), sexuality has less often been addressed in environmental and sustainability studies. For instance, the fourth edition (2011) of Benjamin Kline’s First along the River: A Brief History of the U.S. Environmental Movement makes no mention of lesbian or gay environmentalism in spite of the simultaneous emergence of the environmental movement and the gay rights movement. The first Earth Day was celebrated on 22 April 1970, less than a year after the 1969 Stonewall riots in New York City, which inspired annual gay pride parades around the globe. The 1970s and 1980s saw a proliferation of environmental organizations such as Greenpeace (founded in 1971) and gay rights groups such as the International Gay Association (1978; now known as the International Lesbian, Gay, Bisexual, Trans and Intersex Association).

Some have attributed this seeming dearth in LGBTQ environmental history and scholarship to denaturalizing tendencies in queer theory, a field steeped in antifoundationalism and wary of biological determinism, the belief that human behavior is innate and rooted in biology (Seymour 2013). When for so long queer people and practices have been characterized as “unnatural,” as is evident in the phrase “crimes against nature” in antisodomy and antibuggery laws, it is unsurprising that queer theorists and LGBTQ-identified people have maintained a healthy suspicion of “the natural.” Early scholarship specifically attuned to queerness and nature focused on how rhetoric of “the natural” has been used against marginalized groups—indigenous peoples, women, people of color, and queers. For example, in “Toward a Queer Ecofeminism” (1997), Greta Gaard examines the social construction of “the natural” in Christianity and colonialist rhetoric. Deploying a queer ecofeminist lens, she elucidates “the ways queers are feminized, animalized, eroticized, and naturalized in a culture that devalues women, animals, nature, and sexuality” (119). Gaard’s observations have served as a touchstone for more recent intersectional queer environmental studies.
Just as feminist theory has experienced renewed interest in the natural sciences, especially pertaining to climate change and the Anthropocene (what some call the current, human-dominated geological period), queer studies has increasingly turned its attention to the ecological. Beyond discursive analyses of “the natural,” interdisciplinary scholarship in queer environmental studies has explored topics ranging from “queer” animals to the “eco-(hetero)-normativity” found in many conventional environmental campaigns, such as antitoxics discourse that doggedly insists on a dyad of sexual difference and traffics in eugenics rhetoric (Di Chiro 2010). Sexual politics and the politics of the natural have also informed one another when it comes to the regulation of natural spaces. For example, in the United States, male homosexuality became associated with urban degeneracy and was one of several factors spurring the national parks movement, which aimed to reignite masculine vigor and restore national character (Mortimer-Sandilands and Erickson 2010) while also justifying the relocation of indigenous peoples (Taylor 2016). At the same time, urban green spaces such as parks became well-known and heavily policed sites for gay cruising. Although LGBTQ communities are often associated with metropolitan areas, contemporary ethnographies of rural LGBTQ life demonstrate that bars, community centers, and communes have also been sites of queer resistance (Gray 2009; Herring 2010; Gray, Johnson, and Gilley 2016).
LGBTQ Back-to-the-Land Communities

Many women’s land communes in the United States were founded in the 1970s as part of a burgeoning lesbian separatist movement that coincided with growing environmental activism. “Lesbian nation,” one of numerous ideologies circulating at this time, entailed women establishing their own, nonpatriarchal culture, which included alternative economies, such as barter systems and skill sharing, cooperative childcare initiatives, and communes. Some lesbians took this attempt at “nationhood” literally by joining so-called land dyke communities. Ethnographic studies of these groups have centered on southern Oregon (Sandilands 2002); however, primary materials collected in the anthology Lesbian Land (Cheney 1985) confirm that these back-to-the-land communities existed throughout the United States and included temporary inhabitants from outside the United States. Much of what is known about this period in lesbian history comes from reader-written periodicals such as Maize: A Lesbian Country Magazine, WomanSpirit, and Amazon Quarterly, which circulated between these rural communities.

These periodicals are rife with ecological imagery and nature-based spiritual practices. They also shed light on the environmental positions held by many of these groups. For example, in “A Country Lesbian Manifesto,” the authors explain that “a lifestyle in which you must keep yourself warm, fed, and clean without central heating, plumbing, or plentiful jobs becomes a gratifying reinforcement of self-respect and strength. Which is for us a step in learning to live as a positive contributor to the environment around us” (Sankey and Benewicz 1973, 20–21). The yoking of environmental stewardship with self-sufficiency evident here recurs throughout this branch of 1970s lesbian-feminist thought.

One of the more well-known communities, OWL Farm (later known as the Oregon Women’s Land Trust), explicitly outlined its desire to be an “ecologically sound land-based community” in its charter, which documented its commitment “to preserve land and protect it from speculation and over-development, and to foster the recognition of land as a sacred heritage and resource belonging to all” (quoted in Cheney 1985, 158). Most of these back-to-the-land initiatives were short lived because of financial constraints and the challenges of shared governance; however, the development of Lesbian Natural Resources, a nonprofit established in 1991 to support lesbian land projects, as well as the persistence of several of these communities today, attest to the ongoing legacy of “land dyke” culture.

Another queer back-to-the-land group that emerged around this time is the Radical Faeries, an international network of gay and queer-identified beings, chiefly male bodied, for whom nature worship and nature-based ritual are a central part of their amorphous spiritual practice. On Labor Day weekend in 1979, gay activists Harry Hay, Don Kilhefner, and Mitch Walker hosted “A Spiritual Conference for Radical Faeries” at the Sri Ram Ashram, a desert sanctuary near Tucson, Arizona. Although there were proto-Faerie gatherings in the United States and Europe prior to 1979, Hay, a veteran gay rights advocate, is consistently credited
with introducing and popularizing the moniker Radical Faerie. Hay coupled *radical,* meaning “root,” “essence,” and “politically extreme,” with *faerie* (also spelled “fairy” and “fairie”), an insulting epithet hurled at gay men but also a synonym for sprites and nature spirits.

In the face of internalized homophobia and the devastating effects of the AIDS epidemic, Faeries and their allies sought solace in the secluded enclaves of Wolf Creek, Oregon, and Short Mountain, Tennessee. These sanctuaries are still operational today as are Faerie communes in Canada, Great Britain, France, and Australia. Annual Faerie gatherings occur around the world. For example, in August 2017 the Global Gathering of Radical Fairies, Friends, and Allies met at Featherstone Castle in Northumberland, United Kingdom. The event website underscores the group’s commitment to environmental stewardship: “We meet to deepen connections with each other and the earth and to celebrate the emergence of queer people as storytellers, rite preservers, ceremonial leaders, soul healers, community builders and transformation agents for the whole world” (*Radical Faeries of Albion* 2017). Another global Faerie gathering was slated for February 2019 near Phuket, Thailand.

Radical Faeries, lesbian separatists, and ecofeminists (ecofeminism being a branch of feminism that recognizes connections between patriarchy's degradation of the environment and its oppression of women and other marginalized groups) have rightfully been criticized for culturally appropriating indigenous imagery and practices (*Sturgeon* 1997; *Morgensen* 2009). While recognizing the implications of nonnative and predominantly white American men attempting to free “an indigenous gay nature by briefly removing to the rural and natural sites that code as indigenous in a settler society,” Scott Lauria Morgensen’s ethnographic work on the Radical Faeries nonetheless leads him to perceive their culture as “a creative mediation of the racial, national, and colonial conditions of sexuality” (2009, 91). Radical Faerie writings and interviews reveal that some Faeries were aware of the histories of colonization and imperialism (and the role of hegemonic masculinity therein), as well as their liminal position as both products of settler society and its exiles, particularly at the onset of the AIDS epidemic. In fact, exchanges in Faerie periodicals demonstrate that drawing inspiration from indigenous sources was a point of contention in debates surrounding Faerie spirituality, which prompted some Radical Faerie communities to consult and collaborate with Native Americans and two-spirit persons in the 1990s. Nevertheless, queer environmental studies and environmental studies more generally still have much to learn from indigenous climate justice scholarship, which perceives environmental injustice as a consequence of settler colonialism (*Whyte* 2017).

Relatedly, Jia Tan employs the term *queer transversals* as a way to think “through transnational alliances that go beyond the binaries of West/East or white/indigeneity” and to encourage dialogue between indigenous sexuality studies and area studies—in this case,
Asian sexuality studies (2017, 138). Examining the Beijing International Film Festival’s pragmatic deployment of the term ku’er (derived from the English word queer), which unlike tongxinglian (or homosexual) is less likely to raise the alarms of government officials, Tan argues that “both the essentializing of ‘cultural specificity’ and the accusation of ‘westernization’ ignore the complex process of circulation and the importance of strategic appropriation in China” and elsewhere (144). In other words, understanding sexualities in non-Western cultures only through a culturally specific lens of authenticity or, conversely, presuming the passive absorption of Western lexicon risks overlooking the ways that groups actively negotiate these transnational convergences, strategically deploying (or rejecting) certain identificatory categories at certain times to achieve certain ends. These geographical and sociocultural queer transversals mirror the cellular and genetic transversals and confluences that are discussed in more detail below.

**Contemporary LGBTQ Environmentalism**

Just as gender and sexuality historically have not been the primary axes of analysis in environmental studies, environmental justice has not been a chief focus of the mainstream LGBTQ movement, which has more often been preoccupied with civil rights such as marriage equality. However, the emergence of a number of LGBTQ environmental organizations suggests that this is changing. The Queer Ecojustice Project (QEP) was founded in the spring of 2016. The organizers hope that the QEP will be a member-driven organization for queers living in rural areas, those displaced by environmental degradation and/or homophobia, and those working in environmental justice organizations. On its website, the QEP cites the “cisnormative, white supremacist, capitalist, ableist, settler-colonial heteropatriarchy system” as “the root of environmental degradation,” and the group contends that LGBTQ populations around the world are particularly vulnerable to climate change (QEP 2017).

The coalition Queers for the Climate formed ahead of the 2014 People’s Climate March in New York City. The group draws parallels between US government inaction during the AIDS crisis and the failure to address climate change today. Holding tongue-in-cheek signs such as “Save the Straights (and the planet too),” the group participates in both environmental marches and pride parades. Similarly, the nonprofit Out for Sustainability (Out4S), which was founded in 2008 and is based in Seattle, Washington, formed with the aim of bringing together LGBTQ organizations and environmental groups. Committed to service and advocacy, Out4S funds community-based service projects through Earth Gay (a play on Earth Day); Greener Pride, which promotes environmental action and sustainability at pride parades; and a biennial international conference called the Fab Planet Summit.

Another network of activists who incorporate sexuality into their environmental outreach are ecosexuals. This growing global movement eschews earlier environmental models of the earth as a mother and instead imagines the earth as a lover or partner. The term
ecosexual emerged as an identificatory category on green dating sites in the early twenty-first century as a name for someone who finds nature sensual (or even feels more sensual in nature), but the word has evolved into an environmental philosophy and activist strategy. Two of the group’s most ardent practitioners are the performance artists and activists Annie Sprinkle and Elizabeth Stephens. Sprinkle and Stephens directed the film *Goodbye Gauley Mountain: An Ecosexual Love Story* (2013), which documents the impact of mountaintop removal on rural communities in West Virginia and Sprinkle and Stephens’s efforts to raise awareness about this destructive form of mining through environmental performance art. While not all ecosexuals identify as LGBTQ (Sprinkle and Stephens do), many ecosexuals hope that their unconventional activism can queer and challenge the environmentalist status quo. Presenting itself as a cause for environmental misfits—those who cannot find a home in the mainstream environmental movement—ecosexuality challenges the exclusionary and normative foundations of environmentalism.

Similarly, Laura Houlberg criticizes the environmental group Deep Green Resistance (DGR) for its “transmisogyny,” which she describes as “the confluence of misogyny (the hatred of women) and transphobia,” hate and violence “targeted toward trans women and trans feminine people” (2017, 475). The DGR aligns itself with trans-exclusive radical feminists, second-wave feminists who “[reject] the idea that trans women are women” (475). Houlberg attributes the DGR’s “green transmisogyny” to its “investment in naturalness,” which includes maintaining “the white supremacist, colonialist project of the gender binary” (477). In contrast with the DGR, Houlberg champions Trans and/or Women’s Action Camp, a weeklong trans-inclusive camp where female and genderqueer activists exchange ideas about environmental organizing and direct action.

**“Queer” Animals**

Many indigenous and non-Western cultures recognize gender diversity in nonhuman animals and humans. This is evident both in the presence of multiple genders and in the acceptance, even veneration, of individuals who encompass an amalgamation of masculine and feminine characteristics, such as the *mahu* of the Kanaka Maoli in Hawaii; the *nadleehi* and *dilbaa* of the Navajo, a Native American tribe; the *guevedoche* in the Dominican Republic; *hijras* in South Asia; the *burnesha* in Albania; and the *mashoga* in Kenya and Tanzania (*Independent Lens* 2015). This gender diversity parallels the prevalence of gender bending and shape-shifting in myths around the world: in Norse legends, the god Loki, most often deemed male, is able to transform into a woman; Hindu mythology contains several examples of gender variance among gods, as does Yoruba mythology of West Africa, which includes gods such as Mawu-Lisa, a deity consisting of both male and female elements.

By contrast, in Western cultures scholars and activists have looked to science for the prospect of “queer” animals—those who participate in same-sex acts and child-rearing, as
well as asexual, bisexual, trans, and intersex animals—to counter the supposed unnaturalness of homosexuality and gender nonconformity. Queer science studies offers an interdisciplinary corrective to heteronormative presumptions in animal studies manifested by biologists who dismiss same-sex encounters between nonhuman animals as anomalies. Joan Roughgarden’s *Evolution’s Rainbow: Diversity, Gender, and Sexuality in Nature and People* (2004) critiques the English naturalist Charles Darwin’s (1809–1882) sexual selection theory and illustrates the way heteronormativity colors how scientists interpret the behavior of nonhuman animals, including underreporting same-sex activity and pairings in certain animal populations. Roughgarden extends her illumination of sexual diversity in nonhuman animals to humans as well, challenging dichotomous understandings of sex and gender that underpin the life sciences. Examples of “queer” animals found in both scholarly and mainstream news sources include female-female mounting in Japanese macaques; bisexuality in the early life of male fruit flies; the polyamorous sexual play of bonobos; clownfish who transition from male to female; and co-parenting by male penguins, such as the highly publicized couples Roy and Silo, chinstrap penguins from New York City’s Central Park Zoo, and Stan and Olli, two king penguins and former residents of the Berlin Zoo, who have since moved to a penguin sanctuary in Hamburg. The 2006 *Against Nature?* exhibit at the Naturhistorisk Museum in Oslo, Norway, was the first museum exhibition to showcase animals known for homosexual activity.

© DAVID HECKER/AFP/GETTY IMAGES

**Gay Penguins at the Bremerhaven Zoo in Germany**. As of 2016, there were three pairs of male homosexual penguins at the Bremerhaven Zoo, including the couple Sechs Punkt (Six Point) and Schraegstrich (Slash), shown here. Not only did these penguins show no interest in the female penguins, one of the pairs even coparented an orphaned chick. Evidence of queer behavior in the animal kingdom stands in contrast to
heteronormative assumptions about the unnaturalness of homosexuality.

While recognition of the diverse sexual practices and pleasures of nonhuman animals has been welcomed by many LGBTQ-identified people, activists, and academics, some scholars have warned against the anthropomorphizing of these complex and species-specific phenomena, fearing that these “queer” creatures are of interest only as justification for human queerness. Instead of taking human constructs such as “homosexual” and “gay” and applying them to animals, whose behaviors are often more complicated and dynamic than these terms imply, queer environmental celebrations of biodiversity could challenge not only how humans understand human behavior but also the many ways humans have underestimated animals and plants as cultural beings. In other words, “environmentalists and queers [and presumably queer environmentalists] can engage with accounts of the sexual diversity of animals, allowing them to complicate, challenge, enrich, and transform our conceptions of nature, culture, sex, gender, and other fundamental categories” versus merely using them as justification for human sexual practices and gender identifications (Alaimo 2010, 59).

Animal and plant life have spurred new feminist and queer inquiries into the ecological. Homages to bacteria, fungi, and a host of symbiotic relations therein are not uncommon in contemporary feminist and queer theory (Hird 2004; Haraway 2008), which looks to these nonhuman phenomena to complicate conceptions of bodies and their boundaries and to provide models of interdependence and coexistence. For example, the human body consists of 100 trillion cells, and approximately 90 percent of those cells are microorganisms such as bacteria. Facts such as this have the potential to queer how people understand their bodies, which may not be entirely their own. Along these lines, some gender and sexuality studies scholars are turning to genetics for models of “queerness.” Phenomena such as mosaicism, when a person’s cells reveal different genetic makeups or genotypes, and chimerism, when a person has two complete sets of DNA or genomes, challenge notions of the autonomous human subject by highlighting nonnormativity and “deviance” at the cellular level (Hird 2004). Dana Luciano and Mel Y. Chen, the guest editors of “Queer Inhumanisms,” a special issue of *GLQ: A Journal of Lesbian and Gay Studies*, examine how the boundaries between the human and nonhuman “rub on, and against, each other, generating friction and leakage.” They ask, “When the ‘sub-human, in-human, non-human’ queer actively connects with the other-than-human, what might that connection spawn?” (2015, 186). Queer ecologies and LGBTQ environmentalism offer models for reimagining the world and its many inhabitants. In an era of increasing ecological destruction and uncertainty, the need for intersectional and inclusive global environmental justice doubtless becomes more urgent.

Mortimer-Sandilands, Catriona, and Bruce Erickson, eds. *Queer Ecologies: Sex, Nature,

http://queerecoproject.wixsite.com/qollective

The first and only movie made in communist east-central Europe to deal centrally with the topic of lesbianism.

The film Egymásra nézve (Another way) was the first and only movie in communist Hungary and communist east-central Europe in which lesbianism plays a central role. While there have been films that featured lesbian characters, such as the Hungarian film Hangyaboly (1971; Anthill), romantic love between women had, until 1982, never been a main theme in Hungarian cinema or elsewhere behind the Iron Curtain. Egymásra nézve was based on the semiautographical novel Törvényen kívül és belül (1980; Another Love [2007]) by the Hungarian lesbian novelist Erzsébet Galgóczi (1930–1989) and was directed by Károly Makk (1925–2017). It tells a story of a tragic love affair between two women in the repressive state-socialist political system. In doing so, Makk, who was internationally recognized as one of Hungary’s most prominent filmmakers (Ház a sziklák alatt [1958], Szerelem [1971], and Macksajáték [1972]), created a movie that was groundbreaking not only for representing a lesbian love affair but also for challenging official narratives about state socialism. Egymásra nézve reflects Makk’s innovative style in his choices of milieu, humanistic approach to his characters, and orthodox technique that produced firm story lines and appealing characters (Burns 1996).

Plot Overview

Egymásra nézve begins with what is eventually revealed to be the ending of the story: the recovery of the body of Éva Szalánczky, who was shot by border guards at the Austrian-Hungarian border. The next scene shows Livia Horváth in her hospital bed with a bandage around her neck, being told by a doctor that she will never fully recover from the injuries she suffered when her husband shot her. The rest of the film sets out to explain the prelude to the tragic ending, soon to be revealed as a love story. The story takes place in 1958, two years following the Hungarian Revolution that was crushed by Soviet forces. Éva, the charismatic main character, moves from the countryside to Budapest and lands a job as a journalist at a newspaper, where she falls in love with the married Livia. She pursues her, and it is not long before Livia, whose husband is a military officer, also begins to have feelings for Éva. When Livia confesses her love for Éva to her husband, he shoots her.
Éva, played by Polish actress Jadwiga Jankowska-Cieślak (1951–), is a taboo breaker in more than one way. Not only is she explicit about her sexual orientation, but she is also openly critical of state socialism. As a journalist, her desire to tell the truth about the bureaucratic corruption and forced collectivization in a Hungarian town ends her journalistic career. Éva’s defiance in her reference to the 1956 Hungarian uprising as a revolution rather than a counterrevolution (which was the official interpretation until 1989) is a poignant reminder of the limits of personal integrity in a dictatorship. Éva’s unwillingness to compromise her principles was more disturbing to contemporary critics than her openly lesbian identity. Indeed, over the course of the film, Éva’s lesbianism and her ideological commitment to telling the truth and nothing but the truth serve as metaphors for the political and cultural intolerance of state socialism not only during the 1950s but also in the 1980s. Once lesbianism functions as a representation of vulnerability (personal or political), it loses its particular significance as a nonnormative sexual identity (Burns 1996).

The Hungarian Context

Although homosexuality had been decriminalized in Hungary in 1961, lesbians and gay men were barely tolerated by the communist regime and faced entrenched homophobia. Nothing more powerfully demonstrates the depth of homophobia than the fact that neither of the actresses playing the two main characters of the film were Hungarian. That it was too risky for Hungarian actresses to play lesbian roles reveals the extent to which homosexuality (both male and female) was understood by authorities and the public alike as a medical and social pathology. Throughout state socialism there was a collective silence around homosexuality that was as true for state-run public discourse as it was for private discourse with family and friends.

In this context, Egymásra nézve was transformative in providing a platform for talking about homosexuality and, in particular, female homosexuality. In the words of a contemporary lesbian, the film represented “a great breakthrough” in public discourse about gayness (Borgos 2011, 49). Not only was it the first time that same-sex love (male or female) was the subject of a movie, but Egymásra nézve also initiated the first public discussion about lesbianism since the 1920s. To be sure, the discourse about homosexuality and love between women on the radio, on television, and in the printed press reflected the heteronormative and homophobic attitudes of both the larger public and the commentators (all of whom were male) of the state-censored media. People struggled to provide a definition for what most agreed was a nonnormative and unfortunate phenomenon. Yet, there were also some attempts to frame lesbianism not as a moral or medical pathology but rather as a different kind of love that deserved to be tolerated even if it was not entirely understood.
Significance for Hungarian Lesbians

For contemporary Hungarian lesbians, *Egymásra nézve* was an unprecedented milestone. It served as a new foundation for the formation of lesbian identity and subculture. The portrayal of a self-declared lesbian character who had no shame about her sexual orientation was inspirational. In reality, the idea of a proud and out lesbian could have been only a fantasy for most lesbians at the time. By the 1980s, lesbians had a small clandestine network located in Budapest. While known to the authorities, it remained under the radar for most Hungarians and even to many lesbians. According to interviews conducted with lesbians who saw the film, which “everyone watched about thirty times,” *Egymásra nézve* was not simply empowering personally, but it also opened a new avenue to connect lesbians with each other and to expand the community ([Borgos 2011, 187](#)). The use of the phrase “Egymásra nézve” in the personal advertisement sections of the newspapers became an important code for lesbians to find potential love interests and community.

That one of the protagonists was a married woman, moreover, had added potency for contemporaries, many of whom were trapped within the prescribed heteronormative ideas of state socialism: heterosexual marriage and family. That Livia falls in love with Éva and leaves her husband was both validating and encouraging for lesbians who had left their husbands or were considering leaving them. The performance of Polish actress Grażyna Szapołowska (1953–), who plays Livia, was well received not only among Hungarian lesbians. Szapołowska’s portrayal of the transformation of a heterosexual woman living in a conventional marriage into a woman who could desire another woman and contemplate divorce earned her the Best Actress award at the Cannes Film Festival in 1982.

A Stereotypical yet Authentic Portrayal of Lesbian Romance

In many ways, the representation of lesbian romance in the film reflects an age-old stereotype of a butch-femme relationship. Éva has a masculine appearance and acts as the active pursuer of the relationship; Livia’s appearance is unmistakably feminine, and she longs for a kind of personal attention that she could never have gotten from her husband. The ending of the women’s relationship also fits into a long tradition of artistic Western representations of romantic homosexual relationships (e.g., Radclyffe Hall’s *The Well of Loneliness* [1928]). Here, too, love ends in tragedy and the death of one of the characters. Livia ultimately rejects Éva and her own homosexual desire, while Éva intentionally lets herself be shot by the border guards. That in the end Livia wants to be with her husband despite being permanently damaged by him is an unmistakable sign of a return to normalcy.

At the same time that the film conforms to a conventional treatment of homosexual themes,
the romantic relationship between the two women is portrayed as authentically as any classical heterosexual love story. The intimate moments between the two women in public spaces, their shy eye contact, touching of hands, and eventual kissing are effective in portraying the spark and fruition of love between them. The same moments also reveal the power of the Hungarian state to encroach on one’s personal life. For instance, when the two women’s kissing on a bench draws the attention of policemen, Livia, as a married woman, is threatened with exposure to her boss and husband. Éva, however, is taken to the police. And as she protests her inhumane treatment, the policemen tell her, “We are not in America.” In these moments, the film is unequivocal in exposing the patriarchal nature of state socialism and its consequences for people whose love falls outside of state-sanctioned heteronormativity. In the sex scene that takes place in the confines of the home, the nakedness of the women and the sexual acts between them are suggestive but not graphically depicted. While the sensual moments between the women are aestheticized, the male-female relationship is portrayed in a much more naturalistic manner (Feldmann 2015).

_Egymásra nézve_’s depiction of lesbians and lesbian romance was an early representative of more positive portrayal of gays and lesbians even within the western European and American context. Considering that mainstream east-central European cinema, with some notable exceptions, has avoided and continues to avoid the subject of homosexuality, the legacy of the film is even more significant. Ongoing and even increased homophobia in Hungary and the former Eastern bloc after 1989 mean that LGBTQ-themed films remain a rarity and are mostly produced as independent films. Most mainstream lesbian films—which tend to be rare even within LGBTQ-themed films, such as _Csókkal és körömmel_ (1994; _Kisses and scratches_) by the Hungarian director György Szomjas or _Diši duboko_ (2004; _Take a deep breath_) by the Serbian director Dragan Marinković—continue to represent lesbians and queer female sexuality as something to be pitied and tolerated at best, and as something to be condemned at worst.

Einayim Pkuhot (2009; Haim Tabakman)

YARON SHEMER
Associate Professor of Israel Cultural Studies, Department of Asian Studies
University of North Carolina at Chapel Hill

Since the 1990s, Israeli cinema has shown a growing interest in the life of the Jewish religious communities, especially the Haredi (ultra-Orthodox) strand. The harbingers of this trend often conveyed a stereotypical, demeaning, and even ludicrous depiction of the Haredi community (Peleg 2016). Conversely, the new wave of films made about this and other religious communities in the early twenty-first century—albeit still populated mostly by "outsiders" (secular filmmakers and actors)—renders rich narratives and sensitive characters that the nonreligious viewer is apt to be empathetic toward rather than scorn. Homosexual relationships in the Haredi community may easily lend themselves to a voyeuristic and overdramatized cinematic treatment. However, Haim Tabakman's debut film Einayim Pkuhot (2009; Eyes wide open) delves into a story of homosexual desire not to elicit a titillating effect but, by situating it in the midst of communal engagements and family life, to patiently explore it within the context of a particular socioreligious milieu.

Einayim Pkuhot is set in the Haredi community of Mea Shearim in Jerusalem. After the death of his father, Aharon returns to his family's butcher shop and assumes his father's duties there. A young man, Ezri, appears at the shop's doorstep on the first day Aharon reopens it, and Aharon later offers this odd young vagabond a job as his helper and an available room over his butcher shop. Ezri, the viewer later learns, came to Jerusalem to find a yeshiva young man who used to be his lover but is avoiding him now. Ezri makes advances on Aharon, who initially resists the temptation but then succumbs and finds himself all consumed in this love affair to the point of compromising his reputation in this closely knit community and his place as the head of the family with a wife, Rivka, and four children. Eventually, pressure from the rabbi who urges him to send Ezri away, the growing risk of becoming an outcast within his own community, and the signs of the detrimental effects of his relationship with Ezri on his family prove to be too onerous, and Aharon confesses to his wife that he is ready to resume the life expected of a devoted man in the Haredi community, the way it was before his love entanglement with that young man. The film ends with the return of Aharon to the spring on the outskirts of Jerusalem. As he did before when he accompanied Ezri to that spring, Aharon removes his clothes and submerges in the water; this time, however, he is not seen surfacing.
Body and Impurity

It is a truism in contemporary scholarship that knowledge is inscribed on the body and that, in turn, the body generates knowledge. And yet, in addressing the centrality and the agency of the bodies in *Einayim Pkuhot*, the theologian Stefanie Knauss (2013) employs the term *eigensinn*, which in this context she translates as “stubbornness” and the “will of their own.” It is as if this film proffers a schism between the body and the volition of the mind and eschews the possibility for symbiosis between the two. The body/flesh, with its desires, emotions, pains, and *jouissance* (physical pleasure), defies asceticism, taboos, and conventions, and, ultimately, it upsets the conscious will. In this film, unlike in most narrative films, none of the characters gains raised understanding or consciousness as the result of the narrative junctures and developments. The title, *Einayim Pkuhot* (*Eyes Wide Open*), is therefore deceiving; seemingly it suggests a work that focuses on the ocular or, by extension, with regard to the topic at hand, on cognition, awareness, and acceptance of the homosexual self. And yet, *Einayim Pkuhot* is not a tale of “coming out of the closet.”

The body and flesh/meat (the Hebrew word *basar* stands for both and makes no distinction between the two) are thematically and visually the main motif in *Einayim Pkuhot*. Throughout the film, images of blood (e.g., Aharon cuts his finger as he uses the meat-grinding machine together with Ezri) and the almost tactile presence of meat—slaughtered, cut, sold, eaten—render the film’s color scheme, where the redness or pinkness of the meat/blood/flesh stands in contrast to the otherwise dull, at times almost monochrome, color palette of the mise-en-scène. The film’s first image is of a locked butcher shop (recognized by the Hebrew sign *Itliz*) as Aharon is trying to break into it. A poster on the shop’s front announces the death of Aharon’s father—Menachem Fleischman (the surname meaning, literally, “man of flesh/meat” in Yiddish and German). In a lengthy scene after he breaks into the shop, Aharon throws away rotted meat that he finds in the walk-in freezer. From the outset then, the film thrusts into center stage the flesh/meat/body triad and imbues it with odious connotations.
Jewish traditions, and specifically rabbinic texts referencing the body, do not unequivocally shun the body, and, in contradistinction to various religious doctrines, they do not proffer that the body should, ipso facto, be equated with sin. And yet, the body, and particularly the functioning of its orifices, is engaged in activities that are deemed shameful. In a 2013 article, the philosopher Yakir Englander and the legal scholar Orit Kamir demonstrate that for the Rabbis (Ḥazal) the body, created in the image of God, “is not the abject [serah odef] that one should minimize or even eliminate altogether, rather, it is what constitutes us” (60; translation by author). But then the rabbinical reference to the penis as mevushim, a derivative of the word busha (shame), signifies an intrinsic connection between the male sex organ and shame (Englander and Kamir 2013).

In consideration of shame and modesty, Haredi Jews are required to fully cover their bodies in public. Men in the Haredi communities are black frocked, and only the man’s hands and bearded face are exposed. This is precisely what makes the images of male nudity in the film so striking in the sexual encounters between the two men, as when Ezri and Aharon (and, at the film’s end, Aharon by himself) submerge themselves totally naked in the spring on the outskirts of Jerusalem.

In conventional Jewish texts, homosexuality (defined by the act and not intent or desire) is couched in terms of abomination. Unlike the equivocal treatment of the body in those texts,
the act of sexual relations between men in the Hebrew Bible is categorically a sin and, according to the book of Leviticus (18:22 and 20:13), is punishable by death. The strands of odious meat/flesh/body and of homosexuality converge in the film’s various registers—narrative, visuals, and dialogue. Immediately following the scene where Aharon engages in the act of cleaning/purifying the shop, the good-looking young Ezri appears at the shop’s front door. Thematically then, the removal of the rotted meat concurs with the appearance of a different “nonkosher flesh”—that of the homosexual Ezri. Later in the film, when members of the “modesty guards/patrols” visit the meat shop after rumors of the forbidden relationship spread, their leader tells Aharon that if he does not rid his place of Ezri they will make it public that he “feeds the people with forbidden food.” Toward the film’s end, a Haredi man reads aloud the *pashkevilm* (broadside posters) that, without specifically referencing Aharon and Ezri, warn against the newly revealed abomination in the midst of the community and the risk involved—“Who knows what unholy meat is being prepared in our butcheries?!?” Then, a passerby mutters “trefa”—the Hebrew word for meat that is ritually unfit for eating—toward Ezri and Aharon, who walk behind him. Thus, once again, the film is making explicit the connection between the meat/flesh/body (odious, rotted, nonkosher) and homosexuality.

Aharon (left) and Ezri Bathe Naked in the Spring in Einayim Pkuhot (2009). The scenes in the spring defy a facile association of water with purification or cleansing.

If water in Judaism, as in various other faiths, is often associated with purification or cleansing (e.g., the *mikveh*—the Jewish ritual bath), in this film water in its various forms—
rain, water pipes, and the spring—is linked to what is associated from the viewpoint of the Haredi community with sinful and repugnant engagements or woeful occurrences. The film opens with a prolonged pattering sound of rain over a dark screen; only later does the viewer see Aharon attempting unsuccessfully to open the old lock of the butcher shop with his key. Aharon's first act even before entering the shop is to unpeel from the shop's front the poster announcing the death of his father, which he then folds carefully, brings inside, unfolds again, and spreads on a chair to let dry. This establishes early on the meeting of death (rather than life and purification) and rain/water. The rain gradually gains an uncanny presence as it accompanies the film almost throughout. Despite the pouring rain when Ezri first appears at the shop's doorstep, strangely, he is well lit by what looks like a sunray. Likewise, it can be gathered from a comment Rivka makes to her husband, saying she is glad they reopened the shop before the High Holidays, that the film is likely situated in late summer (or possibly very early fall) when constant heavy rains are an extreme rarity in Jerusalem. Yet again, this somewhat mythic and unrealistic use of rain is not meant to suggest the cleansing of the soul but to accompany the falling of the film's main character. An outdoor water pipe bursts open when Ezri is attacked by his former gay lover and his yeshiva friends. Likewise, the breaking of the water pipe in the narrow alley is associated with disorder and violence—again, a far cry from the cathartic meaning water usually has in various faiths.

Seemingly though, as suggested by Nir Cohen (2012), the act of Aharon's submersion in the spring outside Jerusalem, once in response to Ezri's urging and then by himself at the end of the film, signifies that Aharon is experiencing a spiritual (rather than strictly religious) purification. A close reading of the filmic text, however, challenges this facile interpretation. This is most patent in the sequencing of the shots that includes an extended close-up of wasps buzzing inside a clear ziplock bag. There is first an establishing shot of Ezri with his back to the camera as he is taking off his underwear before taking a dip in a spring. A cut to a close-up of Aharon sitting away from the spring shows him following Ezri with his eyes and then, possibly out of modesty or embarrassment, moving his head sideways and looking down to realize that next to him is a bag with wasps. If anything, this juxtaposition of images exudes a sense of unease for both Aharon and the viewer rather than a sacred or spiritual state. Likewise, if the erotic encounter with Ezri in the spring is supposed to connote purification, then Aharon's return to the spring by himself in the film's final scene is puzzling because Aharon has just put an end to his relationship with Ezri and expressed his wish to Rivka to resume a normal life. Whether the submersion at the film's end is interpreted as an attempt by Aharon to relive the memories of bathing with Ezri before he commits to the mundane traditional family life and a return to the Haredi community as a dutiful member or, alternatively, because the film’s last shot does not show him resurfacing, as an act of committing suicide, these motivations and acts can hardly be associated with spiritual purification.
When Ezri enters Aharon’s butcher shop immediately following the scene depicting the trashing of the rotted meat, there are two contrasts being made: not only the odious and the abject with this young man’s good looks but also the death of the father with the promise of youth. Indeed, one of the most significant and radical themes in this film is the place Ezri takes as a substitute father. Initially, one would not deem Ezri a possible father-figure role model in the context of the Jewish Haredi community: he is feminine both in looks and comportment, free spirited, not a dedicated avrek (yeshiva student), a vagabond, and without family (although the film reveals various stories from his past, there is no mention of Ezri’s family). Likewise, while Aharon’s father was a respected member of this Haredi community, Ezri is an oddball who manages to unnerve nearly everyone who has an encounter with him, save for Aharon and his wife, Rivka. Yet, considerations of scholarship on the construction of Jewish and Zionist masculinity and of the film’s particular Ezri/Menachem Fleischman pairing offer a radically different view of Ezri’s place in this film.

In his seminal work Unheroic Conduct: The Rise of Homosexuality and the Invention of the Jewish Man (1997), Daniel Boyarin argues that in contradistinction to the Zionist rendering of the new Jew (and in contradistinction to Sigmund Freud’s construction of the male psyche and sexuality) as one who is connected to the land, audacious, and, most importantly, hypermasculine, in the Ashkenazi diasporic tradition the ideal man was appreciated for his genteel comportment, his cerebral aptitude, and his tenderness—and, generally, for what are now often associated with feminine qualities. In Beyond Flesh: Queer Masculinities and Nationalism in Israeli Cinema (2004), Raz Yosef attends to the highly constructed nature of the idealized/idolized Zionist body. For Knauss (2013), Einayim Pkuhot offers an alternative to this form of venerated masculinity.

Einayim Pkuhot points to a structural displacement/replacement of the father by Ezri. Even before Ezri’s first appearance in the store that coincides with Aharon’s putting the shop in order—clearing the freezer, picking up his father’s chair that is lying sideways on the floor, probably as a result of his father’s unexpected fall, and picking up the tallit (prayer shawl) —Ezri’s arrival is anticipated, as the obituary post for Aharon’s father on the storefront is replaced by the “help wanted” sign. Oddly, when Ezri enters the shop, he touches the drying mourning poster that has the father’s name in bold letters. Taking the shop’s helper job and accepting Aharon’s invitation to stay until he finds a place (which he never does or attempts to do), Ezri makes himself at home in the father’s room upstairs. Aharon points out to Ezri that his father used to rest in this room. To Ezri’s inquiry whether he too rests here sometimes, Aharon responds, “Rest brings about idleness and idleness brings about madness,” thus implicitly putting his father and Ezri (who is in no hurry to join him in the shop downstairs) in one odd category. When Aharon is startled to hear a thumping sound
from Ezri’s/the father’s room and he rushes upstairs, he finds his father’s chair lying sideways on the floor, possibly because of a kick or push by Ezri, exactly as it was shown at the beginning of the film when Aharon first enters the shop. Furthermore, the implied smoking habit of the father (a cigarette box can be seen on the floor when Aharon enters the shop) is also significant in the film’s stratagem of replacement/displacement with regard to Ezri/the father. Other than Ezri, no other person in this film is shown to be smoking, as if to suggest that the ghost image of the father is incarnated in the young helper.

In their bedroom, following Ezri’s departure owing to his condemnation by the community and the urging from Aharon, Rivka asks her husband, “Where do you want to be?” He answers instantly, “I want to be here,” and goes on to explain away the sin as something that was forced on him from the outside: “It’s not mine. It’s not me. It’s the evil urge [yetzer ha-ra]. It’s the evil urge that took over me. I didn’t bring it into our home.” Aharon is appealing at the end of this monologue—“Protect me.” Rivka moves him closer to her, and the composition when Rivka embraces Aharon’s languid body and cradles him in her lap immediately conjures up the image of the pietà (and a play on a previous scene when Aharon holds Ezri, who had just been beaten by his former gay lover and his friends). “Protect me” can be read then as a plea for Rivka to protect him from the “evil urge” but also as a suggestion on Aharon’s part that he already lost the protection of his biological father and now he has just lost the father’s replacement. In Hebrew, ezri literally means “my help” and is often used in the Bible in the context of a supplication before God. To borrow the French psychoanalyst Jacques Lacan’s (1901–1981) concept of the “name of the father,” the higher and compelling authority of God/father/Ezri are all intermixed in Aharon’s positionality toward this inexorable power.

The unique construction of Ezri as a displacing father figure coincides with the film’s unconventional rendering of gay sexual roles. Aharon seems to be the more masculine and dominant figure in relation to Ezri, who also looks at least half a generation his junior. In all the intimate scenes with the two characters together in bed, it is always Aharon who is atop Ezri. But again, Einayim Pkuhot challenges these facile expectations of “top-bottom” sexual roles. As it turns out, Ezri is the more dominant figure, and there is no doubt he is the film’s protagonist (i.e., the character who motivates the narrative); this tale of homosexual relations unfolds as a result of his arrival in the Haredi community of Mea Shearim and ends owing to his departure. More importantly, in different scenes, the film employs an intriguing composition to render the power imbalance between the two main characters, which results in placing Ezri and not Aharon at the film’s center stage. The first time the viewer witnesses this is in an early conversation between Ezri, with his back to the camera, and Aharon. Because he is facing the front of the shop and the outside, Ezri is well lit and in full focus. Aharon is reflected through the shop-front glass in the dim back of the store, and his image is therefore rather grainy and out of focus. When Aharon joins Ezri on the roof’s terrace (adjacent to Ezri’s/the father’s upstairs room), one finds the same cinematic
scheme—Aharon is in the background, dimly lit and out of focus, while Ezri claims the frame's foreground. The film employs this device a third time in the yeshiva, when Ezri is slumbering in the brightly lit foreground and Aharon is seen in the somewhat ill-defined background behind all the denizens as he is entering the yeshiva.

In her analysis of *Einayim Pkuhot*, Knauss (2013) demonstrates astutely that manhood is rendered in this film in contrast to its construction in both secular Zionism and religious Judaism; the two leading characters clearly do not fit the mold of either Zionism's new Jew or the old diasporic Jew. Yet, notwithstanding the film’s unique tale of a homosexual engagement in the midst of the Haredi community of Jerusalem, it might be argued that the film's most significant feat is to transcend the confines of a gay story and its design to reiterate that one's self can never be reduced to sexuality and sexual orientation. When Rabbi Vaisben visits Aharon in his shop and shows the hooligans of the modesty guards out after they threaten Aharon, a conversation ensues between the two. The rabbi seeks to hear from Aharon why he has not driven Ezri out. Aharon calmly responds, “I feel alive. I need him…. I was dead. Now I’m alive.” Clearly, his desperation for the bond with Ezri is more than sexual. Ezri offers Aharon all that the suffocating Haredi community shuns or cannot offer. Ezri is a free-spirited and independent young man who is more passionate about drawing people's profiles (to an extent, in defiance of the religious prohibition to create figurative illustrations of humans as they are created in the image of God) than about Torah and Talmud study. Ezri brings with him an air of otherness. In an early scene when Ezri is calling his former lover from a public phone, church bells can be heard. In a different scene, when Ezri is alone on the roof, a muezzin’s prayer is heard in the background mixed with Jewish prayers from a synagogue or a yeshiva close by. These are part of Jerusalem’s sound space and definitely so in Mea Shearim, a neighborhood abutting the old city. It is as if the film offers not an eerie homoerotic fantasy that defies reality, but a reality that defies the oppressive boundaries of the self and the place and to which, like Ezri, everyone should be attuned.

FILMOGRAPHY

Elbe, Lili (1882–1931)

RAINER HERRN
Lecturer and Researcher, Institute for the History of Medicine and Ethics in Medicine, Berlin University Hospital Charité, Germany
Associate, Magnus Hirschfeld Society, Germany

ANNETTE F. TIMM
Associate Professor, Department of History
University of Calgary, Canada

One of the first people to undergo surgical sexual transition, in 1930 and 1931, and how this example complicates assumptions about the concept of “transgender.”

Lili Elbe was born as Einar Magnus Andreas Wegener on 28 December 1882 in Vejle, Jutland, Denmark. At the turn of the century, Wegener began studying art at the Royal Danish Academy of Fine Arts in Copenhagen, where he met his future wife, Gerda Marie Frederikke Gottlieb (1886–1940), and where he was well integrated into the artists’ milieu of the city. While he became a successful painter of Danish landscapes, Gerda painted Jugendstil (art nouveau) and art deco portraits. The Wegeners moved to Paris in 1912, becoming part of a bohemian world famous for its unconventional lifestyles. Einar had begun modeling female clothing for Gerda’s portraits, a practice that seemed in retrospect to have been a turning point on the path to establishing a feminine identity. At first only in private but later also in public, Einar began presenting as a woman and being introduced as Einar’s cousin.

Series of Transition Surgeries

The desire to become a woman led to visits to various Paris doctors, most of whom either diagnosed psychopathological illnesses, such as hysteria, or evaluated the wish to transition as a sign of homosexuality, which they viewed as an illness. Appalled by these mischaracterizations, Wegener’s quest to harmonize body and psyche took a dramatic turn after a chance meeting with the Dresden gynecologist Kurt Warnekros (1882–1949). In 1930 Wegener followed Warnekros’s advice and visited Magnus Hirschfeld’s (1868–1935) Institut für Sexualwissenschaft (Institute for Sexual Science) in Berlin for the purposes of physical and psychological evaluation. The first step of this evaluation was a psychobiological questionnaire, which Hirschfeld had been developing since 1899 in order to determine the gender and sexual identities of his patients. Hirschfeld established the
existence of physical and psychological feminine traits, which he confirmed with a blood
test. A series of surgical interventions followed: first surgical castration in Berlin and then,
in Dresden, a penis amputation and other surgeries to create a vagina. The last of these
surgeries, likely an ovarian transplantation, was conducted in 1931 and was fatal,
prompting much press speculation about the cause of death.

Even before her death, news reports about how Einar Wegener had become Lili Elbe were
circulating in the Danish and German press; they implied that she was the first person to
have undergone surgical sexual transition. Yet Elbe’s later role as a key figure in trans
history is complicated by the fact that she never understood herself to be a transvestite—
the word used for all trans people since Hirschfeld coined it in 1910. She insisted that she
had been born as a camouflaged female and believed that she had not changed her sex but
had simply found ways to allow her femininity to express itself. She felt nothing but
revulsion for transvestites, whom she viewed as simply wearing costumes.

The Difficulty of Defining Sexual Transition

Despite Elbe’s self-understanding, both scholarly and popular accounts of her story have
continued to portray her as the first transsexual and a pioneer of a new trans movement.
Her case thus raised the question of how sexual transition should be defined. Does it mean
a life spent living in the social role of the “other” sex? Is it a desire for medical intervention
to alter the body? Or does it entail either the complete removal of the sexual organs of the
original sex or the construction of new genitals? Depending on the answer, many
individuals might be considered to be the first to transition, and several individuals who
underwent surgical procedures between 1910 and 1930 could lay claim to having been the
first to undergo physical transition. In other words, it is important to reject the notion that
only a complete removal of all sexual traits of the original sex and the creation of new
genitals counts as a gender transition, while also taking seriously an individual’s stated
wish to take advantage of any measures available at the time. Even if surgical intervention
is considered necessary to qualify as the first transition, then it was not Elbe who was first
but an anonymous individual treated by the psychiatrist Arthur Kronfeld (1886–1941) and
the surgeon Richard Mühsam (1872–1938) in Berlin in 1920 and 1921. However, despite
having undergone castration, the creation of a vagina, and the implantation of ovaries, this
person has not seemed appropriate as a pioneer or figure of identification because she
returned just a few months later to have reconstructive surgery on the penis and lived
thereafter as a man.

These early trans histories are difficult to investigate because European laws governing
surgery and marriage created incentives to obscure the details of the individuals’ life
stories. Despite the consent forms that Elbe and others seeking genital surgery were asked
to sign, surgeons knew that castration could be classified as illegal bodily injury under
German law and that even performing procedures classified as cosmetic surgery could
open them up to malpractice charges if the patient was unsatisfied. Those involved had every reason to cover their tracks and to be vague about medical details. As Sabine Meyer details in her meticulous 2015 investigation of Elbe’s life, in order to establish a legally plausible justification for the annulment of their marriage, Gerda Wegener had to provide the Danish Ministry of Justice with a medical opinion from Warnekros that Einar’s physical limitations made it unlikely that the marriage between the Wegeners had ever been consummated. Dissolving the marriage was, after all, necessary to allow a legal name change from Einar Wegener to Lili Elvenes—a last-minute change from “Elbe” for which no explanation has been discovered—in November 1930. (The name Elbe has been used in this entry to avoid confusion and because her legal name was never made public.) The surgery itself was possible, because German doctors had been conducting such procedures with the justification that they were the only way to prevent self-mutilation and suicide, a principle that was later enshrined in a 1931 law protecting German surgeons from prosecution.

**Representations and Misrepresentations of Elbe’s Life**

But the most important cause of misunderstanding has been the various ways that representations of Elbe’s life escaped her individual control and became sensationalized or instrumentalized for literary, media, and filmic purposes and even as a side effect of her role as a figure of positive identification for trans individuals. Constructing the story of her transition is certainly complicated by the fact that her medical files were likely destroyed in the Nazi raid on the Institut für Sexualwissenschaft in May 1933 (and subsequent book burnings) and in the bombing of Dresden in February 1945. Yet had they survived, these documents would also have been read through the lens of the complex relationship between Elbe’s subjective desires and their medical interpretation, and they would not change the fact that by the time of her death, Elbe’s story had become a media sensation with its own influence on the history of transsexuality.
In the last year of her life, Elbe sought the help of the Danish journalist, author, and translator Ernst Harthern (1884–1969; also known as Ernst Ludwig Harthern Jacobson) to compile her notes, letters, and reflections into an autobiography. The book was still not quite complete when she died, and Harthern published it in 1931 as a somewhat fictionalized biography under the Danish title Fra mand til kvinde (From man to woman) using the pseudonym Niels Hoyer. Gerda Wegener, Warnekros, and others also contributed to the writing process, making this a book with multiple authors. The later German (1932) and English (1933) versions were not only translations but revised texts. Harthern added new passages and rewrote many others in response to critiques and with the goal of convincingly establishing that Elbe had undergone “the first sex change,” as the 2004 English edition announces in its subtitle. Although Meyer has established that Elbe did authorize the Danish version of the biography and communicated extensively with Harthern about its form right up until the time of her death, changes in the later versions mean that they cannot be considered autobiographical. In sum, Elbe’s legacy cannot be understood without attention to this publication history and to its sensationalizing features.
Despite their obvious sympathy for Elbe as a person, Harthern and his literary agents had every incentive to paint her life story as unprecedented and yet comprehensible to a European public likely to be shocked by any blurring of gender boundaries and any kind of nonconforming sexual activity. *Fra mand til kvinde* thus emphasizes Elbe's desire for children as the reason for her last surgery, and it carefully negotiates the dilemma of Elbe's pre-transition sexuality with statements that adamantly deny preexisting homosexual desire. Even the twenty-first-century filmic depiction of Elbe's life, *The Danish Girl* (2015), starring Eddie Redmayne as Elbe, skirts the issue of sexual desire by failing to include a key scene from the novel on which the film is based. In David Ebershoff's *The Danish Girl: A Novel* (2000), Elbe's Parisian days include regular visits to peep shows, culminating in her seduction by another male patron while they watch a female performer. Although this scene might also be viewed as a fetishization of trans women's bodies, and though it is likely apocryphal, Ebershoff grants Elbe the sexual agency that other accounts deny her in their insistence on describing her transition in strictly binary terms and as a path to motherhood. Both film and novel also entirely ignore Elbe's fame, obscuring how media representations and prevailing gender norms continue to shape her story and influence trans lives. These issues aside, there is little doubt that Elbe has remained a symbol of trans identification to this day because of Harthern's sympathetic portrayal of her quest to become what she knew herself to be.

FILMOGRAPHY

Hooper, Tom, dir. The Danish Girl. Working Title Films and Pretty Pictures, 2015. Film.
La Monja Alférez (The Lieutenant Nun) was the pseudonym given to Catalina de Erauso (1592–1650), a Basque noblewoman who lived as a man for most of her adult life. At age fifteen, she escaped from the convent in San Sebastián, Spain, where she had lived since the age of four and used the fabric of her novice's habit to sew an outfit appropriate for a young man. Before leaving port for the New World, she adopted the name Francisco de Loyola. Later, she became known as Alonso Díaz Ramírez de Guzmán as well as Antonio de Erauso. The dizzying fluctuations of names, languages, professions, garments, and personal conflicts were accompanied by a steady itinerary of geographic relocations in Europe and the New World, ultimately underscoring a fluidity of identities that resist any single fixed designation.
La Monja Alfórez (The Lieutenant Nun). Catalina de Erauso, known as La Monja Alférez, was a seventeenth-century Basque noblewoman who lived as a man and a soldier for most of their adult life.

After nearly two decades laboring in various trades, serving as a soldier for the Spanish Crown in Chile and Peru (achieving the rank of second lieutenant, in part by massacring “hostile” indigenous peoples in the name of the crown), and purportedly engaging in numerous brawls, violent crimes, gambling, and romantic intrigues, Erauso confessed that she was a woman to avoid prosecution for murder. Once Erauso submitted to a physical examination to establish both her sexual anatomy and virginity, she became the overnight sensation known as La Monja Alférez. When it was confirmed that she had not taken final vows to become a nun in San Sebastián, Erauso traveled to Spain to present petitions and testimonies documenting her military service to the Crown. The Spanish monarch Philip IV (1605–1665) subsequently granted her a soldier’s pension, and she purportedly enjoyed dispensation from Pope Urban VIII (1568–1644) to live as a man with the approbation of both church and state. In 1630 Erauso returned to the New World and spent the last twenty years of his life in Mexico working as a trader and mule driver, living as Antonio de Erauso until his death in 1650.

Life Accounts and Historical Documentation

Many different versions of Erauso’s life circulated during the seventeenth century: legal petitions, testimonies, letters, three relaciones (news pamphlets), a potentially apocryphal autobiography, literary and iconographic portraits (such as a painting by Juan van der
Hamen, produced around 1626), a popular play, and an episode from a picaresque novel (Alonso de Castillo Solórzano's Aventuras del Bachiller Trapaza [1637]). These narratives reveal a variety of identities, including rebellious nun, fearless soldier, deviant criminal, exemplary virgin, questionable womanizer, and celebrity spectacle. Despite the historical evidence related to the life of Catalina de Erauso confirming most of the military activities recorded in the memoirs (primarily from official testimonies, certifications, petitions, and letters filed on behalf of the Lieutenant Doña Catalina de Erauso), considerable mystery continues to surround Erauso. Although Erauso's autobiography was recorded as having been submitted to the publisher Bernardino de Guzmán in 1625, no autograph or original copy of this narrative has been found. The poet and author Cándido María Trigueros (c. 1737–c. 1801) owned a copy of the manuscript, which was then transcribed by the historian Juan Bautista Muñoz (1745–1799) in 1784. Muñoz's draft of the autobiography, titled Vida i sucesos de la Monja Alférez, o Alférez Catarina, Doña Catarina de Araujo [sic] doncella, natural de San Sebastián, Provincia de Guipúzcoa. Escrita por ella misma en 18 de Septiembre 1646 [sic], was, in turn, copied by others and later edited by the Basque critic Joaquín María Ferrer (1777–1861) and published for the first time in 1829 under the new title Historia de la Monja Alférez, Doña Catalina de Erauso, escrita por ella misma (Lieutenant Nun: Memoir of a Basque Transvestite in the New World [1996]). After this first publication, the autobiography was altered and translated into other languages, such as French, German, English, and eventually Basque.

There has been much academic speculation about the authorship and veracity of the autobiography. Some scholars believe that the Vida was forged using the 1625 relaciones that describe Erauso's adventures, whereas others have suggested the opposite—that the relaciones were sensationalized adaptations of the original Vida attributed to Erauso. Others have speculated whether Juan Pérez de Montalbán's 1626 play La Monja Alférez was the inspiration for the Vida. Given the absence of a verifiable autograph copy of the original autobiography and the variety of imaginative representations of Erauso produced during the seventeenth century, interpreting her/his life demands a certain degree of conjecture.

**Gender and Sexuality in the Spanish Empire**

Erauso's nontraditional life, which both pushes against and conforms to certain expectations for gender identity and expression, complicates the present-day understanding of gender and sexuality in the early modern Spanish world. Although there is no evidence from seventeenth-century documents that Erauso was believed to possess any irregularities in primary sexual characteristics, some witnesses described certain secondary sexual traits as signaling masculinity. After a private meeting with Erauso, the Italian aristocrat Pietro della Valle (1586–1652) wrote that she admitted to having used a painful yet effective poultice to flatten her chest. Although unsubstantiated, this invasive technique suggests Erauso's firm commitment to live permanently as a man, which is
confirmed by his final years living as Antonio de Erauso. Consequently, Erauso’s successful strategy of verifying her female genitalia (and virginity) to avoid execution and then documenting years of service as a male soldier demonstrate how both male and female gender identities and expression could coexist in colonial Latin America. Seventeenth-century documents predominantly use female gender markers and thereby privilege sex-at-birth, except in some testimonies written by men who knew Erauso only as the soldier Alonso Díaz Ramírez de Guzmán. Nonetheless, despite this privileging of sex-at-birth, that Erauso was able to secure acceptance to live openly as Antonio de Erauso attests to a cultural understanding that the gender binary can be disrupted and made flexible enough to accommodate exceptional cases.

Current studies on Erauso continue to reflect the instability of Erauso’s identity, as scholars and artists are still debating which gender markers and pronouns to use when examining Erauso’s life. Historians and critics in the twenty-first century are divided; some use “she” to reflect early modern treatments of the historical individual, others prefer “he” to respect Erauso’s transgender identity and expression, and others adopt “s/he” or alternate “she” and “he” randomly or according to the context.

Erauso’s sexuality has also been a much debated issue. After Erauso’s shocking revelation, the matrons who examined her body for confirmation of her female anatomy (and her uncorrupted hymen) declared her to be an “intact virgin,” thereby establishing the perception that Erauso refrained from participating in penetrative heterosexual relations, and in doing so retained her feminine sexual purity and “honor.” Many of the accounts of Erauso’s life—the 1617 letter by Agustín de Carvajal, the bishop of Guamanga, to whom Erauso confessed her female identity; the autobiography; Juan Pérez de Montalbán’s play La Monja Alférez, performed in 1626; and two of three news pamphlets (the first of the three, published in 1625 in Madrid and Seville, the last, published in 1653 in Mexico)—depict Erauso as consistently flirting with women in the New World, including direct accounts of her preferences and desire to engage in physical relationships with other women. Surely the tabloid-style anecdotes from these narratives were circulating in the cultural imaginary. The protagonist in the autobiography, for example, describes how “I had my head in the folds of her skirt and she was combing my hair while I ran my hand up and down between her legs” (Erauso 1996, 17). This instance of explicit eroticism is not an isolated case; Erauso frequently expresses a romantic interest in various women in the New World that occasionally results in physical caresses (and unconsummated marriage proposals) but apparently never leads to the discovery of Erauso’s anatomical identity. This pattern persisted well after Erauso’s death, as the third news pamphlet, which recounts the last two decades of Erauso’s life (Última y tercera relación, en que se hace verdadera del resto de la vida de la Monja Alférez, sus memorables virtudes, y exemplar muerte en estos Reynos de la Nueva Fspaña [1653]) is predominantly focused on the open yet unrequited love that Erauso felt for another woman.
Some critics have speculated that Erauso participated in same-sex flirtation only to be convincing as a heterosexual man. Other scholars have commented on how interested parties in the New World manipulated Erauso into romantic attachments and engagements for their own social and economic gain. Of course, these romantic liaisons intersected with issues of race and class, because Erauso—as an educated white Basque aristocrat who enjoyed the privilege and entitlement of her class and ethnicity—was desirable to others, while her/his own preferences (as portrayed in the *Vida*) reveal a racist disdain for racially mixed women in the New World. Regardless of how Erauso’s sexuality is represented (homoerotic, lesbian, trans-male heterosexual, colonialist, virginal, allegorical, and so forth), early modern representations of the Monja Alférez’s erotic desire indicate the perception that s/he was a woman who chose to live as a man who expressed attraction for other women but never for men.

The Monja Alférez in Film, Comics, and Literature

Latin American, Spanish, and North American films, novels, plays, comics, and stories for young adults have manipulated the Lieutenant Nun icon for varying and, at times, opposing ideological purposes. The 1944 Mexican film *La Monja Alférez*, starring María Félix and directed by Emilio Gómez Muriel, for example, portrays Erauso as a heterosexual femme fatale, cross-dressing only to recover her inheritance and win back her fiancé. Forty year later the Basque filmmaker Javier Aguirre interpreted Erauso’s life as an ill-fated lesbian love story in his 1986 film *La Monja Alférez*, while a year later the North American independent director Sheila McLaughlin released the only cinematic version of Erauso’s love life with a happily-ever-after lesbian ending in *She Must Be Seeing Things*. Similarly, the “girl gets the girl” at the conclusion of Odalys Nanin’s 2008 lesbian play *The Adventures of the Lieutenant Nun*.

Given the contradictions inherent in Erauso’s life (as a transgendered individual associated with colonial exploitation, racism, violent crimes, same-sex desire, and seemingly conformist adherence to proscriptions for female chastity), it is not surprising that the Lieutenant Nun can be upheld as the hero or enemy of multiple and conflicting ideologies: Catholic, transgender, lesbian, heterobiased, feminist, misogynist, colonial, racist, classist, and nationalist (Spanish, Basque, or Latin American). In this way, Erauso remains an ambivalent icon—a rebel and conformist, a hero and an outlaw—to be used to represent multiple sides of any controversy, depending on the particular identity assigned to him/her.

The history and current status of the LGBTI community in this East African nation.

Ethiopia is the second-largest nation by population in Africa and, outside of Egypt, the oldest with a continuous history of statehood. It is distinctive in Africa in that its present borders arise not from European colonialism but from its own period of empire building, mostly in the nineteenth century. Except for a brief period of Italian rule, it remained independent, first as an empire then as a republic, throughout the twentieth century. About a third of the population professes Islam or traditional African religions, while the majority adhere to Ethiopian Orthodox Christianity. It has often been in the name of these faiths that Ethiopia has produced some extreme expressions of homophobia in the twenty-first century. In a rare show of ecumenism, for example, the Orthodox, Catholic, and Protestant churches in 2009 joined with Muslim and other religious leaders to demand (unsuccessfully) that the Ethiopian state explicitly prohibit same-sex marriage in the national constitution. The patriarch of the Ethiopian Orthodox church has described homosexuality as “the pinnacle of immorality,” and other spiritual groups equate it with Western perversion, violence against children, and Satanism (Aschalaw 2014).

Same-sex acts are punishable by up to fifteen years' imprisonment. Public opinion registers some of the highest disapprovals of homosexuality in the world (97%; Overs 2015). Whereas local advocates against homosexuality are vocal and enjoy a great deal of support and public platforms, advocates for LGBTI rights are hardly visible except in cyberspace (using pseudonyms), which appears to be the only safe space. The strongest support for the cause of sexual minorities in Ethiopia comes from external actors. The health system is another domain where structural/institutional norms mediate attitudes and the practices of policy makers, patients, and health-care providers. The few studies conducted depict the grave implications for health outcomes, above all by making same-sex sexual practices escape the radar of HIV prevention and control efforts.
Historical Influences and Practices

In one sense this level of homophobia is not surprising. The missionaries who converted the ancient Axumite Empire to Christianity came from Egypt and Nubia, where a strong ascetic tradition defined itself in part as oppositional to the sexual laxness of Egypt’s foreign rulers. The monastic tradition in Ethiopia generated its own sexual tensions that required policing through, for example, prohibitions from as early as the fourth century against bringing boys into monasteries and against any kind of physical touching between monks that might compromise prayerful meditation with carnal thoughts (Greenberg 1988). Over the centuries, its theologians turned increasingly to Old Testament scripture to create a popular, national religion. Those traditions became intimately linked to the power of the “Solomonic” state of Abyssinia, which relied on Orthodox monks to administer the far-flung regions. A male-dominated society with rigidly enforced gender roles was thus not only justified by scripture but very deeply associated with an Ethiopian national identity fighting invaders.

And yet there are also hints of acceptance of sexual and gender diversity within those traditions. The historian Wendy Laura Belcher (2013, 2016), for example, has found documents and artwork from the early Middle Ages that allude to subtle interpretations of Christian doctrine (see also Belcher and Kleiner 2015). Minority cultures within the Ethiopian Empire were subsequently observed to acknowledge same-sex relationships or transgender identities consonant with the ethnography from elsewhere in Africa. Among the Maale of southern Ethiopia, ashtime (which Donald L. Donham [1990] translates both as male “transvestites” and as a third gender) performed domestic labor and ritual functions in the king’s court. The king, it appears, had to be shielded from pollution by female sexuality at key moments in the ritual life of the nation. Men who approached the king at such times thus had to abstain from sex with women or have sex with an ashtime in order to protect the health of the nation. Donham’s informants (in 1975) noted that the numbers and the practice had much declined since the nineteenth century under pressure from the church (Donham 1990). Simon David Messing observed that “transvestites” and “male-female” (wändagäräd) individuals among the Amhara were sometimes insulted but “more often pitied than blamed” and, as such, “tolerated” (1957, 551–552). This reflected an understanding that the condition was innate rather than a choice, as modern homosexuality is generally conceptualized (and condemned) in Ethiopia.

In modern history, Ethiopia holds a special place in Pan-Africanist thought, which characteristically asserts heteronormativity as a defining component of African identity against European cultural colonialism. Ethiopia had successfully withstood conquest during the partition of Africa in the nineteenth century and suffered only five years of Italian misrule starting in 1935. When the emperor returned to power in 1942, he quickly restored the Orthodox church as the state religion and de facto local authority in the rural
areas where the vast majority of the population lived. Any slim hopes of liberalization under US tutelage in the Cold War era were dashed by the revolution of 1974. The new political leadership adopted a crude, repressive form of Marxism-Leninism as state ideology that in many ways was even worse from a human rights perspective, including a pro-natalist policy for its “patriotic” wars against ethnic secessionists. When this regime in its turn fell in 1991, the ostensibly democratic successors replicated much of the old pattern, and at present, the social and political climate makes freedom of speech—let alone freedom of association around sexuality—very difficult.

Clandestinity and Signs of Change

Notwithstanding this harsh climate, a clandestine world of same-sex–attracted people is known to exist in the capital city, Addis Ababa, and likely in others (Tadele 2005, 2010, 2011, 2012; Tekleberhan 2011; Overs 2015). Known to themselves as zegas (citizens) or booshtee (a derogatory term used by the public), they reportedly include many male sex workers in the capital city alone. Clandestinity may avert attention, but in a context of extreme poverty and pervasive homophobia it also contributes to deeply self-harming practices arising from abuse, exploitation, and internalized homophobia. Yet Ethiopia’s size, history of independence, booming economic growth, and strategic importance all contribute to making foreign donors reticent to challenge the Ethiopian government too aggressively on this issue, leaving this hard-to-reach and “most-at-risk” population, along with their wives and girlfriends, almost entirely unserved by HIV/AIDS programming.

There are, nonetheless, signs that change may be happening. Research is being conducted, and websites run from exile are getting word out about the existence of and problems facing the Ethiopian LGBTI community. The government has not responded to pressure from faith groups to increase penalties and more actively police existing law. Indeed, following the state’s cancellation of a planned antigay rally by church groups in 2014, the Associated Press reported that “Redwan Hussein, a government spokesperson, said the anti-gay rally was on certain groups’ agenda, but not the government’s. ‘It [homosexuality] is not a serious crime,’ he said.” There is consequently very cautious optimism that public health arguments and strengthening links with other African activist groups will open new doors for Ethiopia’s sexual minorities.

BIBLIOGRAPHY

An interpretation of indigenous intimate activities in which such activities are framed according to Western sexual categories.

In his 1897 study of the indigenous peoples of Queensland, Australia, Walter E. Roth, an anthropologist and colonial administrator, coined the term *ethnopornography* to describe subjects ranging from pregnancy to foul language to defecation and sexual acts. In describing these things as ethnopornographic, Roth separated them out from the rest of his study and said that discussion of such things was "not suitable for perusal by the general lay reader" (1897, 169). In his use of this term, Roth described a sphere of intimate bodily behaviors that he determined to be too delicate, and hence too pornographic, for the eyes of those nonprofessionals who may read his book.

What Roth described is a broader category than what scholars today mean when they describe ethnopornography as a way in which the Western observer (at first primarily conquerors and priests, and later colonial administrators, anthropologists, and travelers) views non-Western intimate activities that the observer determines to be sexual. In doing so, that observer misrepresents intimate indigenous relationships and bodies, placing them within Western sexual categories. Western observers recategorize indigenous intimacy for many reasons, and they develop prurient, scientific, and bureaucratic rationales to excuse their representations. Some describe what is now termed ethnopornography as an Orientalist gaze, in which the Western official redefines non-Western activities.
Engraving by Theodore de Bry Showing the Dogs of Spanish Conquistador Vasco Núñez de Balboa Killing Indians for Sodomy in 1513. Balboa’s misinterpretation of the activities of the indigenous peoples of the New World caused him to frame their behavior in terms of Western concepts of sodomy, resulting in his meting out this terrible punishment.

**Historical Examples**

Of course ethnopornography began long before Roth named it. In 1513 the Spanish conquistador and explorer Vasco Núñez de Balboa (1475–1519) killed a group of indigenous *putos* (faggots) by feeding them to Spanish dogs. One can detect ethnopornography in the descriptions of this incident, including Theodor de Bry’s (1528–1598) illustration of it. The indigenous individuals depicted were killed because of Balboa’s misreading of sodomy. While the men may have engaged in sexual acts that their Spanish conquerors would describe with the sign of sodomy, they had different interpretations of those acts than did Europeans of the time. Thus ethnopornography led to extreme violence.

Another example of ethnopornography comes from a founding figure in professional anthropology, Bronisław Malinowski (1884–1942). In his *Sex and Repression in Savage Society* (1927), Malinowski observes Trobriand sexual ceremonies and states that “sexual
acts would be carried out in public on the central place; married people would participate in the orgy, man or wife behaving without restraint, even though within hail of each other” (258). While Malinowski attempts to analyze these ceremonies for the details of their sexual meaning, he relates them to Western concepts of monogamy, promiscuity, and sin, arguing that the indigenous peoples had different visions of these things. In doing so, he promotes the openness of Trobriand sexuality in comparison with that of the West—certainly a move that he would have seen as working toward the liberation of sexuality. In his work Malinowski promotes the exoticism of the Trobriand peoples, and he does so in a manner that combines the pornographic and ethnographic.

In another example, the British scholar and explorer Richard Francis Burton (1821–1890), in the terminal essay to his 1885 translation of *The Arabian Nights*, describes the geography of homosexuality: “Within the Sotadic Zone the Vice is popular and endemic, held at the worst to be a mere peccadillo, whilst the races to the North and South of the limits here defined practise it only sporadically.” By asserting the universal presence of homosexuality in the Sotadic Zone, an area he argued included much of Asia and the Americas, as well as the Mediterranea, Burton argues for a geography of perversion (a term used later by Rudi C. Bleys [1995]).

In other examples, Jacobus X argues in his *Untrodden Fields of Anthropology* ([1898] 1937) that sodomy is unknown among the peoples of Africa south of the Sahara. Furthermore, he suggests that both African men and women had large genitalia—arguing that nature has allowed for the people to have pleasurable, rather than painful, (heterosexual) intercourse. Similarly, Felix Bryk states that “the sense of decency among the blacks, fundamentally normal in their sexual life, is repelled especially by sodomitic acts, which are punished severely” (1964, 231).

Ethnopornography seems to have been endemic to European observations of non-European peoples throughout the nineteenth and early twentieth centuries. The technological advances of photography, in particular, led to many photographs taken in which the photographer expressed particular sexual desires toward the exotic, often naked, African, Asian, or Latin American individual. These photographs, sold in various markets throughout Europe and the United States, provided a very thin veil of scientific interest, hiding more prurient goals. The launching of *National Geographic* magazine in 1888 led to the further spread of such ethnopornographic photography.

**Contemporary Viewpoints**

Ethnopornography continues to develop in the contemporary period, as can be seen in a more recent controversy regarding Malek Alloula, whose 1986 book *The Colonial Harem* purports to engage in a postcolonial critique of harem photography. (The French sent these photographs home as postcards.) In doing so, Alloula reproduces many photographs of
women in harems, sometimes in clearly exploitative ways. He decontextualizes the images and allows the reader to see them only in an overly simplistic ethnopornographic light. Many scholars (most prominently, Mieke Bal [1991]) have critiqued Alloula, arguing that he furthered ethnopornography in his reproduction of these images. It is often unclear, unless he simply wants to titillate his reader, why Alloula has included particular images. Alloula closes his book with a telling statement that suggests one goal of the ethnopornographer: “Voyeurism turns into an obsessive neurosis. The great erotic dream, ebbing from the sad faces of the wage earners in the poses, lets appear, in the flotsam perpetuated by the postcard, another figure: that of impotence” (122). This suggestion of colonial impotence makes Alloula’s key point: the French male colonist has a fantasy of penetrating Algerian women, a fantasy that he pictures through the postcard, in which he has taken an image and sent it to a friend. One can sense in this Alloula’s challenge to Frenchmen: they are impotent, neurotic, and, from his viewpoint, overly feminized. Alloula looks at the French postcards from an Algerian nationalist perspective and, in some sense, compares his own masculinity to the masculinity of the French. By doing so, he produces an ethnopornography of the women in the harems.

Ethnopornography lives on today in some anthropology departments in which ethnographers may be trained to dissect the sexual habits of the people that they study, often without enough self-reflection as to the goal of the anthropologist. Of course, professional anthropologists over the past generation have become much more self-reflexive, but this does not change the ethnopornography that continues to play a major role in the sexual tourism industry and in many amateur ethnographies. For example, the great desires that both gay and straight men express for youth from Thailand is widely viewed as both exploitative and ethnopornographic.

Ethnopsychiatry

TIFFANY FAWN JONES
Professor of African History
California State University, San Bernardino

_The systemic psychological study of “non-Western” peoples, particularly as it relates to Africans and homosexuality._

_Ethnopsychiatry_ is a term used to describe a type of psychological study of “non-Western” peoples that emerged in the early twentieth century through which Western-trained scholars sought to understand “the Other” and determine the extent to which culture plays a role in shaping one’s mental state. Influenced by Freudian psychoanalysis and anthropological studies, ethnopsychiatry was generally a blending of psychiatric, psychological, and anthropological understandings of deviance, mental development, and normality. In the 1950s ethnopsychiatry also became known as transcultural psychiatry or psychology. It is referred to as cross-cultural psychiatry as well. Cross-cultural psychiatry, however, reflects a divergence that occurred in the late 1960s when practitioners argued against a universalist application of Western psychiatric categories. Cross-cultural supporters claimed that the universalist idea that similar mental disorders existed in all societies was problematic. Instead, cross-cultural psychiatrists suggested that culture plays a much larger role in the way that madness manifests itself in different societies. Despite these differences, all three terms are often used interchangeably.

Although ethnopsychiatry can trace its roots to the beginnings of modern psychiatry, it rose as a recognized field when such psychoanalytic theorists as Sigmund Freud (1856–1939), Carl Jung (1875–1961), and Marie Bonaparte (1882–1962) and their followers became interested in applying their concepts to the so-called primitive races. They were particularly concerned with symbols and believed in the universality of mental manifestations. Anthropologists and ethnopsychiatrists interested in Asian, Oceanic, and American societies such as George Devereux (1908–1985), who is often ascribed as the architect of ethnopsychiatry, Emil Kraepelin (1856–1926), Géza Róheim (1891–1953), Bronislaw Malinowski (1884–1942), Margaret Mead (1901–1978), and H. B. M. Murphy (1915–1987), adapted ethnopsychiatric practices and debated the viability of a universalist approach to psychopathology. Psychoanalytical ideas were also adopted and adapted by practitioners in Africa such as R. Cunyngham Brown (1867–1945), Antoine Porot (1876–1965), Wulf Sachs (1893–1949), B. J. F. Laubscher (1897–1984), Octave Mannoni (c. 1899–1989), Henri Aubin (1903–1987), J. C. Carothers (1903–1989), Henri Collomb (1913–1979) and Frantz Fanon (1925–1961). Today, ethnopsychiatry continues to be practiced,
although most recognize its problematic history.

**Ethnopsychiatry and Colonialism**

Ethnopsychiatry emerged in conjunction with the colonization of Africa, and the two are intrinsically connected. While there were only a few practicing psychotherapists on the continent, with only a small number of those interested in their African patients, the theories of ethnopsychiatry were often invoked when attempting to define notions of mental difference. Because of its claim to apparent scientific and apolitical research, it became a field in which theories of race and mentality became ensconced (McCulloch 1993). Ethnopsychiatrists were concerned about defining racial, ethnic, and cultural difference not only to juxtapose these against European or Western superiority but also to help shape a nationalist discourse that was so integral to the colonial process. Most argued that there were innate psychological differences between Europeans and those whom they deemed “backward.” Africans were, according to their theories, predisposed to a more “explosive nature” and closer to a “primitive” mentality (Aubin 1939, 13, 17; translation by Tiffany Fawn Jones). The cause of this primitive mindset, however, was up for debate.

Porot, who founded Algeria’s first psychiatric hospital, for example, argued that the Algerian brain was intrinsically primitive and had a propensity for violence caused by a different evolutionary path (McCulloch 1993). Similarly, H. L. Gordon (1934) suggested that, because of physiological differences caused either by genetic or environmental factors, the African brain never developed past the stage of puberty. In contrast, J. F. Ritchie (1943), who worked as a teacher in Northern Rhodesia (present-day Zambia) but wrote extensively about the psychopathology of Africans, argued that it was African culture, not biological difference, that caused African preponderance for failed intellectual development (McCulloch 1993). Influenced by Ritchie, and later to become one of the most prominent ethnopsychiatrists in Africa, J. C. Carothers, who was the superintendent at Mathari Mental Hospital in Nairobi, Kenya, and was commissioned by the British government and later the World Health Organization to write about the psychology of Africans, also believed that African mentality was mainly shaped by cultural and environmental factors. Carothers (1953) proclaimed that modern society negatively affected the African psyche. Asserting that their regional-specific studies could be applied to all Africans, these ethnopsychiatrists reinforced the colonial idea that patriarchal approaches and indirect rule were best for Africans. Thus, they generally claimed that African affairs were best left to “traditional” institutions, albeit with considerable colonial oversight, as Africans were not mentally equipped to adjust to “civilized” or “modern” society.

There was no massive undertaking by colonial governments to build mental hospitals for Africans (Vaughan 1991). Even in those few cases, such as in Algeria, Tunisia, and Morocco, where hospitals were built for Africans, the colonialists used these institutions as a means to define the mad Other and bolster their discipline in the metropole (Keller 2007).
A key component of these psychoanalytical discussions involved concepts of sexual difference. In the early twentieth century, such adoptees of cultural psychology as Adolphe Louis Cureau (1864–1913), a French colonial administrator who wrote *Savage Man in Central Africa* (1915), and Thomas Duncan Greenlees (1859–1929), a superintendent at the Grahamstown Lunatic Asylum in South Africa, argued that modernity caused a breakdown in traditional African sexual norms (Epprecht 2008). When Freudian psychoanalysis became even more popular in the 1930s and 1940s, their views were further elaborated. Freud argued that all individuals were innately bisexual and that experiences with parents and others could lead to an arrested stage of development in which one remained what he called “sexually inverted.” The Oedipal complex was one of his most controversial theories, yet it was commonly invoked when discussing African sexuality. Freud asserted that during the phallic stage of development that occurred between the ages of three and five, a child developed sexual feelings for a parent and jealousy of the same-sex parent. Part of the resolution for these feelings was the manifestation of the superego, an inner moral aptitude that was learned from parents and society. Those who had not progressed beyond this stage could exhibit homosexual tendencies.

Although not all ethnopsychiatrists fully ascribed to Freud’s theories, his ideas did lead to debates about their applicability in non-Western societies. Ritchie (1943) and Carothers (1953) argued, for example, that abrupt childhood weaning and unrestricted “sex play” in childhood among Africans was common. They also believed that, although experimentation was a normal part of development, Africans never progressed past childhood in their mental development. This did not necessarily mean, however, that Africans remained sexually inverted. Instead, Carothers argued that the traditional initiation ceremonies that took place during puberty generally put an end to these uninhibited sexual practices. Ceremonies, therefore, played an important part in the subscription of heterosexual desires and sexual rules, and in turn, “sex perversions, apart from juvenile experiments, seem[ed] to be uniformly rare” (Carothers 1953, 49).

Similarly, Laubscher, who was the head of psychiatry at the Queenstown Mental Hospital in the Eastern Cape and the author of *Sex, Custom, and Psychopathology* (1937), argued that homosexuality was infrequent among Africans in rural areas, especially among men. Although Laubscher acknowledged that “forms of overt homosexual behavior between women” existed, among men it was “entirely unknown” ([1937] 1938, 31). But even those women who exhibited what he perceived as “perverse homosexual activities,” he deemed mentally unstable, claiming that the mythical symbolic creatures that they invoked in their dreams were caused by “penis envy” or “defective libido development,” which occurred at “a time of dissolution of the Oedipus complex” (33). And in cases where homosexual acts among men existed, it was usually because they were “segregated from women” (258), or
as a manifestation of a preexisting psychological disorder. Thus, he was not surprised to find these tendencies in the mental hospital in which he worked (Laubscher [1937] 1938; Epprecht 2008).

Even those African practitioners, such as Fanon, who disagreed with the idea that the African mind was inferior to that of the European and wanted to promote the worth of African culture, argued that homosexuality did not exist among Africans. In his discussion of Martinicans, he argued that although he saw “men dressed like women,” they portrayed all other regular masculine tendencies, and he was “convinced that they lead normal sex lives.” Fanon argued that the Oedipus complex never existed among them and that those Martinicans who exhibited homosexual behavior in Europe did so purely for “livelihood” reasons (1967, 139). Thus, ethnopsychiatrists often explained the etiology of any sexual deviations from the supposed heterosexual norm displayed among Africans as the advent of modern pressures that disrupted traditional practices. For some, this meant a stronger need for the preservation of traditional society. For others, such as Sachs, who had studied under Freud and applied his theories to a study of a Manyika traditional healer (1947), whom he gave the pseudonym John Chavafambira, it meant changing the harsh practices of colonial authorities. Sachs argued that the move to urban areas was a key component of the healer’s neurosis and sexual dysfunction and ascribed the neurosis not merely to modern pressures but to the state’s brutal treatment of those moving into urban areas.

For most of these practitioners, their discussion about sexual difference was meant to ascribe a systemic explanation for homosexuality, albeit often through conjecture and limited evidence. Indeed, the generality and absurdity of their statements was often outrageous. For example, Carothers claimed that Africans’ psychological peculiarity is evident at a glance. He stated the following:

*If one scans the faces of passers-by in any town in western Europe it is clear that most of the people observed are impelled by some continuing inner purpose and yet are also alert to the events around them. If one leaves the ship for a moment at any African port, it is equally clear that most of the faces observed express either exclusive interest in some immediate affair or complete apathy.*

*(1953, 108)*

**FRANTZ FANON (1925–1961)**

Frantz Fanon, one of the most influential thinkers on anti-racist and anti-colonialist movements, was born on 20 July 1925 in the French colony of Martinique to middle-
class parents of mixed-race lineage (African, East Indian, and white Alsatian). At the age of eighteen, young Fanon joined the Caribbean Free French movement, and was later recruited by the French army during World War II. While fighting in France, Fanon was exposed to severe European antiblack racism, despite being awarded the French Croix de Guerre for his bravery. After the war he received a scholarship to study medicine and psychiatry in Lyon and became acquainted with Freudian psychoanalytical theory and the existentialist phenomenology of Jean-Paul Sartre (1905–1980). When he completed his psychiatric training, Fanon secured an appointment in a French hospital in colonial Algeria and later devoted himself to the struggle of Algerian independence from France.

Fanon’s studies, as well as his own experience of racism and colonialism, inspired his first book *Peau noire, masques blancs* (1952; *Black Skin, White Masks* [1967]). He theorized race as an historical construct mediated by a colonialist culture wherein blackness assumes inferiority, and whiteness superiority—each racial signification existing only in relation to the other. As a psychologist, he analyzed the mental effects of colonialism and discovered that colonized subjects tend to internalize inferiority complexes through their encounters with white colonizers—a process he termed “epidermalization” (*Fanon 2008, 13*). He asserted that “the black man wants to be white” and “the white man slaves to reach a human level”—in other words, both suffer the effects of alienation and neurotic disorder (*Fanon 2008, 11*). Inspired by Aimé Césaire’s virtues of negritude, Fanon envisioned “the liberation of the man of color from himself” through a decolonization of the mind—a subject he fully theorized in *Les dames de la terre* (1961; *The Wretched of the Earth* [1965]).

Since Fanon’s death in 1961, scholarly engagement with his work, especially on sexuality, has attracted huge attention with varying interpretations. Notwithstanding his liberationist and anti-racist politics, Fanon has been criticized for a “prejudiced analysis” of homosexuality in European colonial settings (*Epprecht 2008, 86*). He attributed homosexuality to a “neurotic” disorder common in “negrophobic” white males but foreign to Martinicans who led “normal sex lives” and “became homosexuals” in Europe only as “a means to a livelihood”—as in prostitution (*Fanon 2008, 180*). While Fanon’s tentative assumptions about male homosexuality may seem a minor error in otherwise revolutionary writing, Kobena Mercer maintains Fanon’s comment is “homophobic” because it denies the “political economy of masculinity in black liberationist discourse” (*1996, 125*). For Terry Goldie, the homophobia in Fanon’s work comes from “his psychoanalytical model” that was influenced by Freudian traditions (*2005, 85*). Lewis R. Gordon extended the critique of Fanon’s psychoanalytic theory, showing how it fostered the “colonization of sex and sexuality” (*2015, 67*). These varying interpretations of Fanon and sexuality complicate an assessment of his liberationist mission, although his homophobia may be as personal as his experiences of negrophobia.
In contemporary Africa, controversies about sexual minority rights show no sign of disappearing, despite the apparent dematerialization of homosexuality as a “nonissue” by some African leaders. The media has consequently fuelled stereotypical images of a “homophobic Africa” vis-à-vis a progressive West (Zimmerman 2013). Despite Fanon’s limitations, his strident call to evade an imitation of colonial-racist impulses of human comparison, and its concomitant construction of inferiority and superiority, may be relevant to addressing modern expressions of homophobia. He cautions: “Humanity is waiting for something from us other than such an imitation, which would be almost an obscene caricature” (1965, 315)—a moral imperative to chart a new course.

He then extended this claim to speculate that Africans in urban areas all had a “mental uniformity” that failed to develop in the same way as Europeans. Carothers surmised that
the failure of Africans to follow traditional initiation ceremonies, which he thought aided in their social and mental development, could in turn lead to failed relationships and sexual dysfunction. Similar assumptions were common in many practitioners’ writings. However, because these practitioners were arguing that homosexual behavior rarely occurred in traditional African societies, they were also indirectly inferring that it was more common among the urban white or European populations.

Thus, in discussing the advent of nonhetero practices among white men on the African continent (they rarely discussed women’s sexuality), the practitioners’ arguments were usually careful not to chastise or promote criminalization for what they saw as a psychological disease. In a 1928 article, F. O. Stohr argued that “the only right way to treat perverts of every kind is with pity, and if possible, with understanding. They are people whose sexual life has somehow gone astray or remained undeveloped, who are therefore shut out from the greatest happiness of life—marriage and children” (459). Even in more totalitarian states, such as apartheid South Africa, practitioners argued that homosexuality should not be demonized or criminalized. In a government investigation into homosexuality during apartheid South Africa in the 1960s, when psychiatrists were called in to testify about the prevalence of homosexuality in Johannesburg, the Society of Psychiatrists and Neurologists of South Africa argued that homosexual practices were psychological afflictions that were fashioned by child-rearing and parental practices outside of the person’s control. Although various practitioners presenting information disagreed on the cause and treatment of homosexuality, all argued that homosexuality should not be criminalized (Jones 2012).

Even though a few ethnographical studies—such as Pierre Hanry’s Érotisme africain (1970; African eroticism) and Paul Parin, Fritz Morgenthaler, and Goldy Parin-Matthèy’s research (1980)—contradict the idea that homosexuality was not prevalent in African societies, these have not been acknowledged by practicing psychologists in Africa. African scholars still adopt the idea that LGBT individuals are rare among traditional Africans. These views have been perpetuated by some prominent African politicians, including Robert Mugabe, the former president of Zimbabwe. Mugabe’s personal physician for many years after 1980 was Michael Gelfand (1912–1985), who was initially the physician in charge at the old Salisbury Hospital in Southern Rhodesia (colonial Zimbabwe). He, too, argued that homosexuality was virtually absent in “traditional” Shona society and suggested that modern influences increased dysfunction (Gelfand 1979). Thus, it should not be surprising that Mugabe declared that homosexuality was an imported European scourge on the continent. The literature of denial created by ethnopsychiatrists has served to substantiate these claims.

Although ethnopsychiatry claimed to offer some insight into the African mind, it was loaded with racist inferences and conjecture about African sexuality. Far from being an altruistic, systemic view of mental and sexual health, it inserted itself into the colonial process under
a pseudoscientific veneer. The application of ethnopsychiatric beliefs has led to absurd conclusions about normality and sexuality that have reinforced heteropatriarchal European ideas of superiority. Ethnopsychiatry is, therefore, an example of how a supposed scientific theory could be socially constructed and extremely prejudicial.

Eunuchs

GEORGE H. JUNNE JR.
Professor, Africana Studies Program
University of Northern Colorado, Greeley

The role of the castrated male in various cultures throughout history.

Historically, a man who was castrated was called a eunuch in English. According to Dorland’s Medical Dictionary, the term eunuch is defined as “a male deprived of the testes or external genitals, especially one castrated before puberty so that male secondary sex characteristics fail to develop” (2012, 653). The condition of being a eunuch is called eunuchism. The castration of males is an ancient practice that began with animals and over time has been used to punish conquered peoples, or men who have committed certain crimes against society. There have been two types of castration: the first is the removal of the testicles, and the second, also called “shaving,” involves the complete emasculation of males, with all external genitalia excised.

Eunuchs have been traced the world over, including in indigenous populations in the Americas. Historically, scholars have identified three primary types of eunuchs: castrati, who have had both the penis and testicles removed; spadones, who have had only the testicles removed; and thlibiae, whose testicles have been bruised or crushed. Research reveals at least seven purposes for castration, historically:

1. to retain the supremacy of male elders, as when older males mutilated the genitals of younger men to prevent challenges to their authority and to possess more women;
2. to demonstrate having vanquished an enemy and to gain a trophy, as when, in the 1896 Battle of Aduwa, Ethiopian forces castrated 7,000 Italian soldiers;
3. to provide trusted guards for harems, as well as advisers for rulers;
4. as punishment for rape, adultery, and other sex-related crimes;
5. for religious purposes, such as self-castration to promote chaste living;
6. to preserve a boy’s voice for singing; and
7. to “treat” certain conditions, such as leprosy, epilepsy, sexual perversion, insanity, gout, priapism, excessive masturbation, cancer, or an enlarged prostate, and other maladies.

Contrary to the modern use of eunuch as a derisive term to indicate a man’s powerlessness, history reveals that many eunuchs held high social and political positions, exhibited formidable managerial and pedagogical skills, were artists and scholars, and excelled in
other areas. Not only were many eunuchs not celibate or asexual, but they could be sexually active and seen as desirable by men, women, or both. Eunuchs are primarily known for their professional roles in religion, the legal system, and the military, as well as in government bureaucracies. For instance, eunuchs in the city of Medina, present-day Saudi Arabia, have guarded the tomb of the prophet Muhammad since the twelfth century. In China, eunuchs held a high degree of political power during twenty-three dynasties, and a few were military leaders, such as Tong Guan of the Jin dynasty (1115–1234), who commanded 800,000 troops. In the Ottoman Empire, the sultan’s chief black eunuch (CBE) held the third most powerful position (Aucoin and Wassersug 2006).

Although the sexuality of eunuchs has long been written about and discussed, there has been little reliable information on the subject until almost the twentieth century, probably because of social and religious censure of nonnormative sexualities. During the Ottoman Empire there were accounts of eunuchs—castrati, spadones, and thlibiae—in heterosexual relationships. Furthermore, there are hints that some eunuchs were chaste and others probably engaged in homosexual activities, but much of that lacks support. There is no reason to assume that eunuchs would not have engaged in the array of sexual relationships, just as other men would.

An important power that eunuchs possessed was the ability to move between men’s spaces and women’s spaces, particularly in societies that secluded women. Eunuchs oversaw the administration of royal harems in the Ottoman Empire, for instance, because they were perceived to be immune to sexual temptation, by virtue of their physical condition. While eunuchs policed the sexuality of the women in their care—which included ensuring the women did not have sex with each other—some eunuchs did engage in sexual activities with harem women.

**Eunuchs in China**

The first recorded use of eunuchs dates to the Chou dynasty (1122–250 BCE) in China, although there is some earlier evidence of eunuchs in Mesopotamia as well. Eunuchism was practiced in China until the collapse of the imperial government in 1911. Castrated males worked in imperial palaces as chamberlains in the harems and in other areas. Enslaved captives of war sometimes were castrated to serve in menial positions, and some free men, desiring power and wealth, castrated themselves; these ambitious eunuchs sought to attain power by demonstrating their undistracted devotion to their emperors and guaranteeing that, since could not have children, they would not establish a rival dynasty. Those who chose castration carried their sex organs with them in a jar of brine in accordance with the Confucian belief that in order to enter the next world after death, one’s entire body must be buried together.

In her book *Harem: The World behind the Veil* (1989), Alev Lytle Croutier related that in
1877, English soldier and traveler G. Carter Stent published an article that described how the Chinese castrated their eunuchs and, furthermore, how they controlled hemorrhaging, which was a problem in other areas of the world. The subject was first bound with bandages around the thighs and waist to staunch the flow of blood. Then, after the groin area was bathed in hot pepper–water, an instrument shaped like a sickle was used to cut off the testicles and penis and a pewter plug was pushed into the urethral opening. The man or boy was held up and forced to walk around for a couple hours and then placed in a horizontal position and not allowed to drink anything for three days, suffering from pain and thirst. After the third day, the bandages were removed along with the plug. If urine spurted from the opening, the eunuch would probably recover; if no urine flowed, or if it flowed slowly, he was likely to die from his wounds. Among the Chinese, the death rate from castration was only about 4 to 5 percent (Stent 1877), compared to mortality rates as high as 90 percent in other parts of the world.

The Chinese tradition of castrating foreign prisoners of war lasted more than 3,000 years. The practice ended in China only in 1924, and the numbers of eunuchs varied from just a few hundred in the early years to over 100,000 in 1624. However, it appears that only Chinese eunuchs were employed in royal palaces of emperors and princes; this contrasts with the Ottoman Empire, for instance, where the court employed eunuchs from European and African countries.

Sometimes Chinese eunuchs in the inner court closest to the rulers challenged government officials or bureaucracies that were primarily run by Confucians, who had their own civil service examinations by the tenth century. Despite challenges to their authority, the Confucians did not call for the complete elimination of the practice of castration because they believed that eunuchs provided important services, including protection of the harem women. The Confucians did, however, move against individual eunuchs for corruption, abuse of power, and other offenses.

Many Chinese eunuchs, like eunuchs in other societies, had families outside the palace. Younger ones may have been permanently separated from relatives when they were conscripted from faraway provinces. Older ones who were married and had children before being made eunuchs sometimes were able to maintain family life outside the palace. Powerful ones were able to arrange the marriages of their children with important officials or even members of the imperial family. Others married maids or other female domestics of the palaces, or even managed to marry women from outside the palace. A few had both wives and concubines.

Chinese eunuchs “constituted a distinct and powerful administrative cadre for 2,000 years” (Balch 1985, 319) to check the “influence in politics of the tenacious Chinese family system” (Coser 1964, 883), and this often incited jealousy that negatively focused on their unique physicality. For example, the Chinese eunuch Chao Kao, who was recorded to have been the
tutor of Ha-hai, the younger son of the first emperor, Qui Shi Huang (r. 246–210 BCE), was described by one scholar as the first in a long line of eunuchs in Chinese history, many of whom were also disreputable. In the Former Han dynasty (c. 206 BCE–25 CE), eunuchs staffed government positions, but only a few rose to significant positions of power. Depending on the politics of the time, Chinese eunuchs, like those in other empires, had authority that ranged from low-level administrative status to almost running the kingdom.

In Beijing, in the Forbidden City that housed the Chinese court, eunuchs protected the cloistered women. Approximately 1,000 eunuchs were in Beijing during the Ming dynasty (1368–1644), but their numbers declined to only 200 in service for the reign of the last emperor, Pu Yi (r. 1908–1912). Many received good educations and held positions ranging from singer to imperial administrator. In 1996 a Washington Post article announced the death of ninety-three-year-old Sun Yaoting, the last eunuch to have served in China’s imperial court system.

**Eunuchs in India**

Like the thugs, a supposedly widespread gang of professional robbers and murderers sanctioned by the goddess Kali and suppressed by the British, eunuchs became implicated in Britain’s empire-building project in India. In the mid-nineteenth century British colonial officials in North India claimed that the region was plagued by a criminal system of eunuchs who were addicted to sodomy, worked as prostitutes, and forcibly castrated children (Hinchy 2017). After the passage of Part 2 of the Criminal Tribes Act in 1871, police began to register eunuchs suspected of sodomy, kidnapping, and castration. Particular targets were the region's *hijras*, a rather fluid term, but assumed to mean “male-bodied emasculates or ‘eunuchs by birth’ who adopted feminine clothing and, in many cases, female names” (Hinchy 2017, 127). Hijras were thus implicated in the processes by which Indian sexuality was typed as deviant; as Anjali Arondekar notes, it is crucial to pay attention to the role that the “coupling of colonialism and sexuality” plays in recent academic studies of them (Arondekar 2009, 90). Hijra studies as an academic area has emerged only in recent decades, while previously much of the disseminated information came from colonial accounts.

In India, the term *hijra* (a Hindu/Urdu word with Arabic roots) is laden with controversy over who is included in the definition and who is excluded. Some associate hijras with homosexuality, others with transvestites (*zenana*), and still others see hijra as a transgendered identity involving castration, genitalia defects, or impotency (*sandha*). Some include hermaphrodites in their definition, whereas others include women and “third-gender” individuals. Many hijras stroll through public spaces and earn a living by attending wedding ceremonies and singing and dancing for the guests, singing at births, or through sex work. Although castration is outlawed in India, some hijras still undergo the procedure (Gannon 2009).
The eunuchs who served as guards and attendants in the Muslim sultanates and Mughal Empire—who were also considered hijras—have a history that spans from early recorded history to modern times. Also known as khojas, they were employed in the palaces and harems of the queens and have been featured in literature. Those who were selected to guard the harems sometimes had their tongues cut out, probably to keep the intimate matters of the harem confidential. Whenever the queen left the palace, as many as 400 eunuchs guarded her, while others served and cooked for the king. Some eunuchs—for example, Malik Kafur, who dismissed the heir to the throne of Alau-Din-Khiliji (r. 1296–1316)—were able to attain considerable power. Others became prosecutors, built towns and mosques, commanded the police, and held other important positions. From 660 until 1955, they commanded the inns that protected people traveling across India.

Eunuchs in the King James Bible

The Old and New Testaments of the King James version of the Bible mention eunuchs over twenty times. The book of Deuteronomy states that castrated eunuchs were not allowed to enter the temple according to Jewish law (Deut. 23:1), probably because this was done to ban “outsiders” and non-Jews. In the book of Matthew, Jesus distinguishes between three types of eunuchs: those born with the condition, those who were made eunuchs, and those who “have made themselves eunuchs for the kingdom of heaven’s sake” (Matt. 19:12). Although the first two forms of eunuchism are better known, there were cases of men castrating themselves for religious or political reasons. Philip, a disciple of Jesus, converted a eunuch who was a highly ranked official serving Queen Candice of Ethiopia. As told in the book of Acts, Philip baptized him in a river, making him the first recorded eunuch member of the early Christian church (Acts 8:26–40). Later Christian churches forbade marriages between women and eunuchs.

Following in the wake of liberation theology, some scholars looked to the biblical representation of eunuchs when interpreting contemporary queer identities and reinterpreting sacred books such as the Bible in more liberal ways. Sean D. Burke, for instance, points to the ways that eunuchs—both those castrated prior to puberty and those castrated later—“troubled the multiple discourses of gender, sexuality, social status, and race that produced ancient constructions of masculinity” (Burke 2011, 181). He concludes his analysis with the hope that “members of Christian communities will consider the implications of the role of queering in early Christian discourse for the lives of contemporary persons who could be identified as flesh-and-blood queering figures, including lesbian, gay, bisexual, and transgendered persons” (Burke 2011, 187). In a related vein, Manuel Villalobos sees the story of the Ethiopian eunuch in Acts 8:26–40 as challenging the way Israel understood masculinity, gender, and the body (Villalobos 2011). Reading this episode through the lens of queer Chicana theorist Gloria Anzaldúa, Villalobos argues that bodies in borderlands—such as the Ethiopian eunuch and queer,
undocumented, and poor persons—offer new ways to envision being human.

**Eunuchs in the Middle East**

During Iran’s Safavid dynasty of the sixteenth century, eunuchs guarded the inner gate of the royal harem’s three gates. This was a position of respect and honor for those who also regulated the sexual practices of the women, escorted guests inside the harem area, and alerted women so they could conceal themselves when strangers arrived. The eunuchs also accompanied and guarded the women when they left the harem. A few of them did obtain high government positions, such as the Georgian eunuch Khusra Khan Gurji, who was governor of the Iranian provinces of Yazd and Isfahan, as well as Kurdistan and other regions. Eunuchs in the Qajar dynasty (1785–1925) also had major roles as overseers and administrators.

Egyptologist Piotr O. Scholz (2001) has traced castration in Egypt back to prehistoric times and has noted that it was designated as punishment in the Code of Hammurabi (1728–1686 BCE). He further detailed that early Buddhist, Christian, and Muslim ascetics performed self-castration to secure their chastity and to satisfy their quest for redemption. Additionally, castration was used to punish sex crimes and as a medical treatment for hernias and transsexuality. Scholz notes that castration was an ancient custom and that hundreds, or even thousands of eunuchs were employed in the courts of Babylon, Assyria, Egypt, Persia, and Kush.

**Castrati**

From the end of the sixteenth century and during the seventeenth century, particularly in Italy, castrati singers in churches and opera were very popular. The castrati were prepubescent boys who were castrated before puberty caused their vocal cords to lengthen, deepening their voices. Observers described the singers as having smooth and pale skin, no beard, and a tendency to be overweight. The Church of Rome provided the impetus for producing castrati; the first one sang in the church’s choir, probably in 1553. In 1589 Pope Sixtus V (1521–1590) issued a papal bull supporting the inclusion of four eunuchs in the choir of St. Peter’s Rome. Although bodily amputations were against canon law, the castrations were deemed acceptable because the castrated boys were used in music that honored God. Previously, boys and adult males had sung in falsetto, but the voices of the adult males were unsatisfactorily deep and the boys’ voices did not have enough power. Furthermore, at that time there was a papal injunction against women singing in public.

It was the new Italian musical entertainment of the early seventeenth century, opera, that prompted the rise of the castrati. Although some professional castrati moved to opera from church choirs, the popularity of opera, which catered not only to the upper classes but also
to the general citizenry, produced greater demand for singers. The treatise “Eunuchism Displayed,” published in 1718, describes operations on boys between the ages of seven and nine. The operations almost always took place in Italy and in secret, and it has been estimated that their numbers were as high as 4,000 a year; castration, however, could not confer a talent for singing, and many boys underwent the process needlessly.

As opera spread to many European cities, some castrati, such as Giovanni Manzuoli (1722–1782), became very famous and wealthy. Carlo Broschi (1705–1782), known as Farinelli, had a voice that spanned three octaves and reportedly could hold a note for a full minute. Giusto Tenducci (1735–1790) moved from Italy to London and became a friend of composer Wolfgang Amadeus Mozart (1756–1791); he (like some other castrati) maintained his libido and married. Giovanni Velluti (1781–1861) was probably the last of the famous castrati singers. Castrati continued to be part of the Sistine Chapel choir until 1808, when Napoleon ruled the Papal States; after his removal in 1815, they returned and continued singing in the choir until 1902. The last Vatican castrato was Alessandro Moreschi, who died in 1922; he was recorded by gramophone in 1902 and 1904, and although the quality is not optimal, his voice is discernable.

Jean D. Wilson and Claus Roehrborn (1999) note that although there was a long association between singing and castration in Italy, there is none in the histories of the Chinese, Ottoman, and Skoptsi eunuchs. Furthermore, they assert that some of the castrati were actually cross-dressing women posing as castrated men, men with diminished functioning testes (hypogonadism), and men who were physically intact but had natural countertenor or falsetto singing voices.

**Skoptsi**

During the reign of Catherine the Great (r. 1762–1796) and through the Stalinist era, a community of Christians in Russia practiced self-castration in their quest for both spiritual pureness and eternal life. The Skoptsi (also transliterated as Skoptsy, Skoptzy, Skoptzi, or Skopzi) secret sect of Central Russia, founded in 1757, may have numbered more than 10 million at its height. The castrations of its adherents took two forms. In the first, called the minor seal, the scrotum was sliced open and the testicles removed as the practitioner called out “Christ is risen”; in the second, the major seal, which conferred higher purity, the penis was also removed. Because of the threat of prosecution, Skoptsi would claim that an unidentified stranger, or someone who had since died had made them eunuchs.

The Skoptsi, also known as the White Doves, believed that Adam and Eve in the Garden of Eden were sexless, and that after the Fall caused by eating the fruit of knowledge of good and evil, portions of the forbidden fruit were transplanted onto them as genitalia and breasts. In order to regain the prelapsarian chaste state, the Skoptsi castrated and emasculated themselves with knives, razor-sharp stones, pieces of glass, or red-hot pokers.
Women's breasts and external genitalia were sometimes mutilated. The Skoptsi believed that the second coming of Christ would occur only when their numbers reached 144,000, the number of the elect according to the book of Revelation; although they no longer have the number of adherents they once had, they still have a few followers.

Historically, it appears that many regarded eunuchs as messengers of God, and some have argued that images of angels were modeled on pre-Christian concepts of eunuchs (Taylor 2002). Religious art from the Byzantine era, for instance, depicts angels as genderless or even mortal. They were supposed to serve as “trusted guardians, celestial protectors, and advisors to the Lord,” fulfilling a role similar to that of eunuchs serving earthly rulers (Aucoin and Wassersug 2006, 3166). That explains why some sects, such as the Skoptsi, extolled eunuchism as a path to heaven, and why others refused to engage in sexual activity.

**Byzantine Empire (330–1453)**

During the rule of Irene of Athens (r. 780–802) in the Byzantine Empire, eunuchs reportedly formed a swarm like bees around her in the palace (Guilland 1943). Another ruler was given 300 slaves, 100 of whom were eunuchs. Theobald I, when marquis of Spoleto (r. 929–936), captured Greek soldiers and made them eunuchs. Although the Byzantines had laws that prohibited eunuchism, they seemed to have ignored them.

Justinian I (r. 527–565) specifically banned eunuchism after learning that out of ninety men who underwent the operation, only three survived. Those caught creating eunuchs had their property seized and were sent to work the mines—if they survived the retaliatory operation. Furthermore, all enslaved eunuchs were emancipated. However, the practice did not end, and when Leo VI ascended the throne (r. 886–912), he significantly rolled back the penalties to fines and whippings.

Until the Council of Nicaea (325), the Byzantine Christian church did not reject eunuchs, many of whom held clerical positions as patriarchs, metropolitans, bishops, and monks. Others, including Narses, a general under Justinian I, served with distinction in the military, or in civilian service, even managing the state on occasion. Still, eunuchs were criticized and even reviled, as revealed in a saying that dates to the Byzantine era: “If you have a eunuch, kill him; if you do not have one, buy one and kill him” (quoted in Guilland 1943, 234).

**Ottoman Empire (1453–1923)**

It is in the Ottoman Empire that one finds some of the most complete histories of eunuchs, via a system inherited from the Byzantines, whom they conquered. The Ottomans kept very detailed records for over 500 years; these have been supplemented with travelogues,
photographs, letters, newspaper articles, court records, and diaries. In 1893 and 1903 the sultan had an official compile detailed registers of eunuchs of the royal family, which included brief biographies, positions held, and dates of service. Previously, historians had mostly focused on the sultans, including some information about important court eunuchs and their roles.

The Ottomans, like others, took slaves from populations they conquered and also participated in slave trades. Many of their captives were made eunuchs, and many from the slave trade arrived as eunuchs. At the beginning of the empire, eunuchs mostly from Europe worked in the harems of the royal palaces, but also in the harems of rich men who had multiple wives and concubines. From the early 1500s, European eunuchs—Hungarians, Slavs, Germans, Armenians, Georgians, and Circassians—virtually ran the daily operations of the palace under the direction of the Babussada Aga (Kapi Aga, or chief white eunuch [CWE]), who wielded immense power. Penzer (1956) notes that palace eunuchs held the following important positions:

1. Kapi Aga: as head of the inner service and confidant to the sultan, palace gatekeeper, and head of the infirmary, he controlled all messages, petitions, and state documents for the sultan, and could speak to the sultan in person;
2. Hazinedar-basi: as head of the treasury and head of the corps of pages, he was responsible for the royal treasure and kept the financial records;
3. Kilerji-bashi: as head of the kitchen staff, he supervised the sultan’s food;
4. Serai Aga: he supervised the harem and headed the palace school.

Because it was contrary to Islam to castrate a man, the operations took place outside Constantinople. Although some Muslims ignored the ban, most traders got eunuchs from "eunuch factories" located in Verdon (France), Samarkand, and Coptic Christian communities in Egypt, Bukhara, Prague, and Kharazon. Centers in Africa included Damagaram (in present-day Niger), Bornu (in present-day Nigeria), and Baghirmi (in present-day Chad). Because many African captives were neither Christian nor Muslim, some felt that it was acceptable to castrate them.

Six of the Ottoman governors-general of Egypt in the sixteenth century were white eunuchs who had previously served in the imperial palace. Until the late sixteenth century, all eunuchs, African and white, were under the authority of the CWE, the palace’s officer-in-chief. When the royal family and the harem was relocated to the new Topkapi Palace, which was completed in 1465, a separation became necessary, and the black eunuchs were placed in charge of the harem. White eunuchs were no longer in charge of the black eunuchs, and a division of labor based on race came into effect, with white eunuchs assigned to the male areas of the palace and the blacks to the harem, which put them in close contact with the sultans.
A major change in the Ottoman system occurred under the reign of Sultan Murad III (r. 1574–1595), after the death of the powerful CWE Gazanfer Aga, a powerbroker who had on occasion challenged the sultan. Other white eunuchs also created their own centers of power and challenged the sultans, but after Gazanfer’s death by beheading in 1603, the power of the CBE expanded substantially as he was able to develop his own political networks. He was also head of the religious foundations, educated and managed the harem women, established a foundation that funded the holy mosques in Mecca and Medina, mediated between the sultans and their courts, endowed religious institutions, built public fountains to supply clean water, set up endowments for mosques throughout the empire, supervised the publication of books and collected books, was a witness at sultans’ marriages and other ceremonies, held councils meetings of his own, participated in political decisions, supervised the guarding of the palace, and in a couple of cases, assisted in eliminating a sultan. From the late 1500s until the end of the Ottoman Empire in the early twentieth century, the CBE was the third most powerful person in the empire.

There was only one CBE at a time, and at times he supervised over 200 other eunuchs, plus other personnel. Some of the CBEs died in office, some were executed if they ran afoul of the sultan, and others retired or were forcibly retired to Egypt, leaving behind their horses, some of their personal slaves, mansions, and many of their personal belongings. In Egypt, the retired CBEs received a salary and supervised the sultan’s investments in the flax trade and other areas. Some were appointed guardians of the Prophet’s tomb in Medina and the Ka‘ba in Mecca until recent years. One, Abbas Aga, amassed twenty-seven books, commercial properties in seven regions, shops, storage rooms, a dye house, linen works, homes, lands, storehouses, coffeehouses, and more. It is quite clear that in today’s money, the CBEs would have been millionaires, or close to it.

El-Hajj Beshir Aga was the longest serving CBE, from 1703 to 1730. He was born in Abyssinia around 1655, castrated as a boy, and eventually received increasingly powerful appointments from the sultan. He presided over important building projects, including a hostel in Medina, educational institutions in Medina and present-day Turkey and Bulgaria, various public fountains, and a mosque complex in Istanbul.

The last two Ottoman CBEs each served for only a month; Nadir Aga (d. 1962) served in March 1909, and Fahreddin Aga served during April and May of the same year. Following the end of the Ottoman Empire, Nadir Aga purchased over three dozen head of cattle and sold milk. He and other palace eunuchs remained in Istanbul and, along with other members of the former sultans’ household, formed a retirement association by pooling their resources. Others found positions in various parts of the Arab world that still used eunuchs in harems and households. Into the 1970s, one could see the last of the palace eunuchs walking around Istanbul.

Croutier, whose grandmother and grandaunt were in the harem of a wealthy man, grew up
in a house with servants and odalisques who sometimes revealed to her details of harem life. According to them, some eunuchs were familiar with aphrodisiacs and erotic paraphernalia, and because they could leave the harem, “they were able to obtain a variety of sex toys, including artificial phalli and other kinds of erotic succedanea” (Croutier 1989, 135). Furthermore, they were so skilled at oral sex that women who married after leaving the harem were dissatisfied with their husbands, and their marriages sometimes ended in divorce when the wives told their husbands that eunuchs were better lovers.

Modern Castration

In the period following World War II, chemical castration began to be used in certain instances to “treat” homosexuality, which was illegal in many parts of the world. Chemical castration has also been used and continues to be used on sex offenders in cases of pedophilia and rape in many parts of the world.

In North America, about 40,000 men a year begin androgen-deprivation therapy, either through surgery or chemicals, as a treatment for prostate cancer (Aucoin and Wassersug 2006). Side effects include gynecomastia (breast development), erectile dysfunction, and reduced libido that may affect a man’s self-identity and sexuality. According to Gary Taylor (2002), the operation to create a eunuch should not be confused with gender-confirmation surgery. Trans people transfer from one gender category to another to achieve a desired gender position through surgery or hormonal therapy. Eunuchs, by contrast, are socially produced through procedures and, therefore, biologically altered, but they do not change gender category. Yet, many scholars and trans people themselves find this distinction problematic, seeing it as a reductive way of thinking about the complex gender positions of eunuchs both historically and in the twentieth and twenty-first centuries.

There are other men who undergo, or desire to undergo castration, including fetishists, for reasons as diverse as libido reduction, gender dysmorphia, and masochism. In 2007 Richard J. Wassersug and Thomas W. Johnson published a study of eunuchs and “wannabes” (men who express the wish to be castrated) based on a survey they conducted with members of the Eunuch Archive, an internet community of more than 3,500 members who reported fascination with castration and/or castration paraphilia (sexual interest in the idea of being castrated). Responses from wannabes far outnumbered those of “voluntary eunuchs.” Wassersug and Johnson compared “castrated cancer patients” with “voluntary eunuchs,” and concluded that “the biological impact of castration can vary greatly depending on one’s desire and expectation” (2007, 553).

Representing and Theorizing Eunuchs in the Contemporary World

Whether or not eunuchs embodied queer identities and sexualities in the historical past
and whether or not being castrated was traditionally seen asemasculating and leading to a loss of authority and power, both suppositions constitute important ways of thinking about eunuchs in the contemporary era. In the second half of the twentieth century, feminist and queer scholars began to unpack the idea that the organizational principle for society revolved around the possession of a penis, or phallus (a situation sometimes called phallocentrism). Phallocentrism was central to the theories of the influential psychoanalyst and critic Jacques Lacan (1901–1981). Particularly under the microscope were claims by psychologists, beginning with Sigmund Freud (1856–1939), that women's sexuality is grounded in a notion of lack; that is, because women do not have a phallus, they suffer from what is popularly termed “penis envy.” Also challenged were psychological models of homosexual men that relied on notions of an “arrested development” akin, in many ways, to emasculation and to the status of women vis-à-vis their perceived “lack.” In 1970 Australian feminist scholar and writer Germaine Greer (1939–) published *The Female Eunuch*, arguing that traditionalist social structures had made women into eunuchs and rejecting assumptions about women's supposedly innate lack of sexual desire. Greer critiqued the definition of femininity “as meaning without libido, and therefore incomplete, subhuman, a cultural reduction of human possibilities”; to become feminine, according to Greer, is to be castrated (Greer [1970] 2012, 79).

That same year, French literary theorist Roland Barthes (1915–1980) published *S/Z*, a structuralist analysis of Honoré de Balzac's novella *Sarrasine* (1830), about the castrato Zambinella. *S/Z* anticipated many of the insights of 1980s and 1990s queer theory; since its publication, queer theorists have mined literary and social texts to argue that the eunuch is a figure who destabilizes gender norms—and one who highlights the performative nature of gender. In her 1989 book *Chaucer’s Sexual Poetics*, Carolyn Dinshaw proposed a “eunuch hermeneutics” in her reading of the “Pardoner’s Tale” in Geoffrey Chaucer’s *Canterbury Tales* (1387). Dinshaw argued that as “not-man, not-woman,” the Pardoner foregrounds an ideal for a Christian society not bound by the norms of the male/female gender binary (1989, 184). The figure of the castrato stands as a representation of the queering of vocalization in *The Queen’s Throat: Opera, Homosexuality, and the Myth of Desire* (1993), in which Wayne Kostenbaum draws connections between “the castrato's scandalous vocal plenitude” ([1993] 2001, 159), repressive discourses around sexuality, and coming out as a kind of voicing.

Outside the European context, Howard Chiang’s *After Eunuchs: Science, Medicine, and the Transformation of Sex in Modern China* (2018) charts a genealogy in Chinese culture from the eunuch's historical role as an exceptional figure on the margins of gender categories to the emergence of trans and queer identities in the twentieth century. Chiang also considers China’s metaphorical portrayal as a “castrated civilization” in the late nineteenth and early twentieth centuries, alongside perceptions of eunuchs as a demasculinized “third sex.” Chiang is one of a number of scholars who implicate eunuchs in a long global queer history of sex and gender, particularly around Western imperial expansion into Asia. Frank
Proschan (2002) analyzes French colonial interest in the “capon” (literally, castrated roosters) or “eunuch mandarins” who served in the imperial court in Annam (now Vietnam). Claire Lowrie describes how white British and Australian men viewed their Chinese “houseboys” in Singapore and Darwin, respectively, as “eunuch-like, feminised, servile and cunning creatures” (Lowrie 2016, 72).

This queering of eunuchs is also found in literature, film, art, and television. Since 2011, eunuch characters have featured in the television program Game of Thrones. As Brooke Askey argues, Game of Thrones uses eunuchs to subvert the notion that the penis or phallus is the root of power and, thus, to subvert heteronormativity. “Castrated men and women characters from the HBO series Game of Thrones challenge the patriarchal ideas of who is able to have power,” Askey writes, noting that these characters also challenge the relationship between anatomy, power, and gender norms (2018, 65). Acclaimed writer and activist Arundhati Roy’s 2017 novel The Ministry of Utmost Happiness, which revolves around the character Anjum (born Aftab), a Shi’a Muslim who becomes a hijra, signals one of the ways various cultural conceptions of eunuchs circulate today. As the contemporary era’s understanding of gender and sexuality continues to evolve, it is certain that the ways we look back at and reinterpret eunuchs from the historical past will also continue to change.

McCullagh, Francis. “Amazing Discoveries in the Yildiz Kiosk following the Fall of Turkey’s Sultan Reveal a Condition Surpassing Fiction.” *New York Times*, 6 June 1909.

From its inception in 1956, the annual Eurovision Song Contest (ESC) was conceived as a European institution but has become increasingly queer, not only delineating an understanding of the European community but also bringing together fans across nations, thus forging a transnational community. The event with its original seven participating countries has steadily grown alongside the evolution of what is “European,” a concept that goes beyond borders and the political definition of the European Union (EU). Starting in 1993, former Warsaw Pact countries began entering the contest, increasing the list of participants to twenty-five that year alone; and by 2017, forty-two countries participated in the event hosted in Kiev by the preceding year’s winning nation, Ukraine. The increasing scope of the ESC has resulted in the decision in 2008 to divide the original one-night event into two separate semifinals and a finale so that every nation has the opportunity to have its contestant broadcast at least once. The ESC has made it its policy to include countries not considered European in political or geographical contexts, such as Israel (participating since 1973) and Turkey (since 1975), and even Australia entered the contest in 2015. This development has been seen as an indicator of pro-Europeanness because many of the countries being added to the list of contestants have, in many cases (but certainly not all), become members of the EU later on.

Although the ESC rules explicitly state that no lyrics, speeches, or gestures of a political nature are permitted, the intermingling of music and politics has drastically increased since the late 1990s. Especially with regard to gender and sexuality, the avowedly apolitical ESC agenda has become a hotly debated political arena. Turkey, for instance, has been bidding for EU membership for years and for the longest time was without luck in the ESC contest. Therefore, the victory of Sertab Erener in 2003 was seen as a historical moment, turning the frustratingly slow movement toward the Turkish EU membership into a feasible goal. Turkey’s sudden success after years of spectacular failure has been a cause for debate. Certainly, Erener’s song “Everyway That I Can” projected a Euro-friendly Turkishness with its hybrid musical aesthetics mixing Euro-hip-hop-pop with Middle Eastern belly-dancing rhythms. Yet, in addition, the Turkish government's decision at the time to oppose the US effort to set up a military base in Turkey to provide an invasion route into Iraq garnered
Turkey much sympathy across a Europe displaying increasingly antiwar sentiment and may have sparked extra support for Turkey's ESC participation. What seems evident, though, is that this success boosted the confidence of an increasingly visible gay community in Turkey and especially in the country's “gay capital,” Istanbul, a boost that climaxed toward the end of the decade and has since diminished as a result of the government's conservative turn to re-Islamized politics. As in Turkey, the ESC has a great appeal for LGBT audiences all over Europe and beyond and there are celebratory parties hosted in bars and clubs across all participating nations akin to gay pride and gay Olympics festivities. While this suggests a queerness transcending national borders, the contrary may be true if looking at developments since the turn of the twenty-first century.

**Camp Politics**

The ESC has been hailed—and chastised—for its campiness. Indeed, Eurovision fandom can be read as a secret code for being gay. While traditionally camp is known for its exaggerated style, surface entertainment, gay sensibility, and, above all, apolitical stance, the various instances of camp performance on the ESC stage have repeatedly been understood as sending clandestinely political messages and thus moving beyond a commodified notion of camp that has become all too accessible and nonthreatening in its willingness to suit the (straight) masses. Ultimately, camp is a mode of deconstructive reading from a queer perspective mocking hetero assumptions about gender, desire, and identity. Camp thus produces a dialogue between performers and spectators with the assumption that the latter have a sensibility to decipher the formers' ironic undertakings ([Babuscio 1993; Ross 1988](#)). In contrast to camp performances in gay clubs, at gay pageants, or during gay pride events, where there is a recognized confluence of queer actors and queer audiences, the ESC campiness relies on a covert acknowledgment that large parts of the audience have a queer enough eye to successfully indulge in the guilty pleasure of enjoying the carnivalesque transgressions of the performances. Because the contest is about nations competing against each other, notions of nationality may very well be the butt of any campy joke.

Verka Serduchka's second-place performance in 2007 representing Ukraine can be seen as an instance of camp that has the potential for both aesthetic disruption and political subversion. Such camp taps into archival resources of the past and produces new perspectives on familiar material. Serducha's song and drag show "Dancing Lasha Tumbai," through her glittery and futuristic costume, played with notions of the ESC's status as "gay Christmas" (or "gay Passover" in Israel)—a "national holiday" for the LGBT community as important as gay pride—and the drag tradition of staged feminine hypersexuality, while the lyrics and score were ambiguous. "Lasha tumbai" was variously understood as meaning either "Russia goodbye" or "whipped cream" or making no sense at all, and the music had resonances to marches and waltzes, thus referring to various musical
traditions of “old” Europe, such as military parades and ballroom dancing. Serduchka as representing the emerging “new” eastern Europe was holding up a self-reflective queer mirror for the celebratory claim of a unified Europe moving in a synchronized beat and forging a coherent transnational body out of disparate anonymous crowds. Other performances have also used camp to point toward future events not yet known. Among the performances arguably perceived as camp were the Russian (faux) lesbian girl-group t.A.T.u. in 2003 and the Norwegian monster rockers Lordi in 2006. These performances may convey a multitude of prospects, including above all utopian notions of an imagined queer transnational community.

Queer Nationality after 2014

Such utopian longings notwithstanding, developments since the late 1990s have opened up new gaps between queerness and national identities. Starting in 1997 with the high camp performances of the first openly gay contestant, Páll Óskar (Iceland), and the following year with the first trans woman, Dana International, representing Israel with her contest-winning song “Diva,” Eurovision entered its acknowledged phase of visible LGBT politics. At the same time, Dana International’s victory was discussed both as symbolizing Israel’s membership in a sexually liberal West and as diverting through “pinkwashing,” a sort of publicity campaign to consolidate Israel’s proclaimed democratic reputation and paper
over the country's continuing discrimination of Palestinians and its internal homophobia; reproach for the latter was repeated years later when Azerbaijan hosted the ESC in 2012 despite accusations of ongoing human rights violations and repression of LGBT people. The phase of visibility continued in the twenty-first century with the lesbian Serbian winner Marija Šerifović (2007) and Krista Siegfrids from Finland (2013) with her song “Marry Me,” which covertly critiqued the Finnish parliament’s decision not to vote on equal marriage legislation and ended in a stage kiss between two female performers. The trend furthermore included Slovenia’s 2002 trans group Sestre and culminated in Conchita Wurst’s victory for Austria in 2014 with her anthem “Rise Like a Phoenix.”

Controversies about Conchita’s performance already surfaced prior to the contest and escalated after. Russia, along with Belarus and Armenia, called for a ban on the broadcast of the ESC in 2014 because of the participation of Conchita and to replace the event with an alternative “Voice of Eurasia” contest, which would have revived the short-lived Intervision Song Contest, the equivalent of the ESC created for the countries of the Warsaw Pact and held from 1977 to 1980, with a single follow-up contest in Sochi in 2008 featuring eleven post-Soviet countries. The various discussions did not so much concern the openly gay singer Thomas Neuwirth but rather his choice of the bearded drag persona Conchita Wurst (later just Conchita), and they were as diverse as hailing her as an ambassador for diversity (a role she herself adapted later on in her visits to the European Parliament and the United Nations) and as denouncing her as a harbinger of moral decay. Clearly, with a gay man appearing as a woman sporting a full beard, Conchita’s performance challenged a gender system based on heteronormativity.

Initial homophobic and transphobic media reaction from Austria and other European countries gave way to a more streamlined narrative that lauds a progressive queer-friendly western Europe against a backward homophobic eastern Europe. While there is no denying the extreme homophobic statements, especially those of several Russian politicians, this cannot be taken to represent millions of eastern European people making up a largely enthusiastic ESC audience. Indeed, contrary to the often assumed West-versus-East bloc-voting, Eurovision voting revealed that while the expert juries of all the excommunist states voted significantly lower than all the other competing countries in favor of Conchita, the public televotes varied far less.

Given that the official policies in Russia and some other countries participating in the ESC have run counter to the overall tendency in Europe to ensure LGBT equal rights protection and have involved the enforcement of legislation that de facto encourages discrimination against queers, the pro-queue voting behavior in these very countries gives reasons for hope. The increasingly queer discernibility of the ESC, however, has so far not expanded to include visible and outspoken bi- and intersexuals, queer Muslims and Roma, or LGBT people of color. Time will tell whether the call for an all-encompassing queer politics, so dear to LGBT devotees from all nations, will reach a truly transnational ESC vision.

BIBLIOGRAPHY

Marriage equality has been at the forefront of media attention for some time now, with rights to marriage linked to “love rights” and to the entitlements of equal citizenship by LGBTQ groups. Following the legalization of same-sex marriage in the Netherlands in 2000, many countries have enacted versions of the same, and several countries in Asia have either succeeded in doing so or are in political ferment over the issue. This entry examines such attempts as part of global and national aspirations for rights and resources, while also remaining cognizant of the disproportionate attention given to claims of love-associated rights (e.g., marriage) of certain groups by appeal to sovereign powers in certain times/spaces. The framework of marriage ironically validates a powerful model of heteronormative belonging and marginalizes alternative forms of kinship and belonging. Mindful of the impossibility of providing a panoramic view of the divergent practices of love, family, and law in the different histories, cultures, and geopolitical localities that loosely constitute “Asia,” this essay foregrounds the tangled and uneven relationships between family law and broader structures of political economies, ideologies, and cultures. It argues for possibilities of queering legal heteronormativity and decolonizing marriage equality as a form of aspirational Western modernity by highlighting some strategies of sexual minorities in Asia for negotiating love, marriage, and law.

Although “Asia” often features in the Western imagination as an exemplar of overweening patriarchal culture and associated violent practices, it is a continent with uneven histories of colonization (European and/or intra-Asian), different types of states (from Global North capitalist to socialist to the underdeveloped Global South and much in-between), a variety of religions, class and caste hierarchies, and kinship systems (including several matrilineal and polyandrous groups), as well as divergent traditions of gender and sexuality. Gender and sexuality, correspondingly, do not line up neatly along axes of heterosexuality versus homosexuality or as straight versus LGBTQ as characterized in Western reckonings. They
are better understood through discourses of embodiment, gender, and sex as “a global process of transformation whereby a variety of non-procreative, same-sex behaviors become homogenized under the rubric ‘gay’ or ‘lesbian,’” with “these new identities … merged into local histories and contexts” (Phillips 2000, 18) or generating new hybrid forms (Kang 2014).

**Forms of Kinship and Belonging**

Intimate relationships and legal systems of marriage do not line up neatly. Asian subjects, like their counterparts elsewhere, seek rights, entitlements, and recognition through engaging the state as well as by drawing on transnational discourses of liberal subjectivity and sexual human rights. Instead of uncritically celebrating legalization of same-sex marriages in Asian nations as necessarily “progressive” and “emancipatory,” we might contextualize these moves within the broader political economy and ideology. At the same time, we cannot discount other groups’ persistent efforts to pursue their intimate and affective life outside/beyond the radar of the state. For instance, instead of seeking formal conjugal relationships or “coming out,” many gay men and lesbians in China choose to “bring in” their partners as close friends to live with their parents, a practice of kinship and family alternative to the legalistic form of marriage (Chou 2000).

Queer theorists have argued that “family law” is arguably heteronormative to its core, grounded in the mapping of property, rights, and responsibilities in terms of kinship, following “sex-gender” systems (Rubin 1975; Butler 2002). Kinship formally functions through the traffic of marriage, with heterosex being the technology that constitutes the validity of marriage (and thereby the route to accessing entitlements of labor, property, children), with “consummation finaliz[ing] the performative utterances of wedding, … very precisely articulated in law as a particular corporeal practice” (Brook 2000, 140). Same-sex marriage can thus pose a threat to “the heterosexual logic of the conjugal body politic” (Brook 2000, 147). When states do adopt marriage equality they may do so in dissonant ways, such as by extending the scope of the formal marriage contract to same-sex couples as a form of equity, while not reconceptualizing the reproductive logic of family law (Robcis 2004), in effect “extend[ing] rights of contract while in no way disrupting the patrilineal assumptions of kinship or the project of the unified nation that it supports” (Butler 2002, 16–17). Such legalization of intimate relationships of sexual minorities follows a teleological lineage of incorporating new categories that reinforces rather than unsettles the underlying reproductive logic of marriage, and excludes groups that might not be willing to follow this route.

**Colonial Codification of Heteronormative Patriarchy**

Marriage and its variant legal forms have always been at the center of ideological and geopolitical maneuvering in the Asian context. In some parts of Asia under direct European
colonialism, such as British governance of India, there was allegedly minimal intervention in “personal laws” (largely overlapping with “family law”). The colonial authorities claimed to cede authority in this domain to families and communities, but thereby often encoded the practices of select hegemonic patrilineal communities into law, marginalizing matrilineality, plural marriage, other customary practices favoring women, or customs sheltering kin who were unmarried or widowed. Postcolonial laws typically retained these practices favoring the new ruling regimes.

In other Asian regions that allegedly maintained an “independent” status both before and throughout the two world wars, European colonizers also effectively spread their influence and solidified their de facto control through the manipulation of the systems of marriage, family, gender, and sexuality. For instance, as early as the late nineteenth century, King Chulalongkorn (1853–1910), the fifth monarch of the Chakri dynasty in Siam, started the modernizing process of the country through the adoption of Western military and agricultural technologies. While the British government did not establish a direct colonial control in the region during the process, it did disseminate its hegemonic influence over the Siamese government through the imposition of its monogamous marriage system and heteronormative gender codes as “civilized” and “superior.” Chulalongkorn’s successor, King Vajiravudh (1880–1925), succumbed to colonial pressure and adopted the Western monogamous marriage system and gender norms (Atkins 2012). During the Meiji era in Japan (1868–1912), the posturing and showcasing of the Victorian nuclear family style and gender relationships in the public space became one of the central conduits for the reformist camp to articulate their political stance and successfully rally support from the general public, which turned out to be a watershed moment in Japanese history (Karlin 2002). Likewise, in China at the dawn of the twentieth century, the Nationalist government relied upon the reform of families to articulate and legitimize its vision of building a new nation. The intellectuals involved in the New Culture Movement proposed the replacement of the authoritarian, patriarchal, extended family structure with a more egalitarian conjugal family as the key to national salvation and state-building (Glosser 2003).

**Postcolonial Marriage Reforms**

After World War II, the reform of marriage systems and family law was key to decolonizing/independence movements across Asia. Since the foundation of the People's Republic of China in 1949, marriage has been utilized as a key biopolitical tool to consolidate and further the so-called socialist construction (Friedman 2006). For instance, state-imposed “marriage reform” targeting ethnic minorities was foregrounded as one of the central moves to symbolize and circulate the narrative that the party-state “salvaged” minority groups, such as Tibetans, from their “barbaric” practices of kinship, sexuality, and gender relationships, and catapulted them into “civilized” socialist society. In the meantime, the state restructured the legal system of family and marriage in ways to allow
women more room to claim their own rights (particularly that of divorce) and independence, which was in turn used to indicate socialist China’s moral superiority over the “decayed” capitalist camp (Wang 1999). In postcolonial Singapore, the state has instituted a draconian homophobic law that originated but was never practiced in Britain, and meanwhile has been promoting the bourgeois nuclear family as one of the core social values to increase the fertility rate and produce more “high-quality” (read here as native, middle-class, and well-educated) populations to engineer and sustain the city-state’s global hub status (Atkins 2012).

More recently, many contemporary nation-states, decolonized or otherwise, have instituted laws of marriage and property that bring increased equity along gender lines, in the wake of transnational treaties such as the 1979 Convention on the Elimination of All Forms of Discrimination against Women (CEDAW). Many LGBTQ movements have also sought inclusion within family law, given the place that marriage and family occupy as proxy for some of the most substantive entitlements through the state, including health care, rights to children, or economic support. But rather than seeing these reforms toward gender equality or rights for sexual minorities as welcome hallmarks of modernity, we might notice that the reforms often signal a nation’s political maneuvers as much as a triumph of LGBTQ organizing. The newly elected Taiwanese government utilizes its legislative move toward marriage equality not only to demonstrate its own liberal stance over social issues vis-à-vis its predecessor but also to highlight its alignment with the liberal West and to garner more moral leverage in geopolitical competition, especially with China’s drastic return to an authoritarian stance under the presidency of Xi Jinping after 2013 (Shi and Sung 2017).
Taiwan’s First Same-Sex Buddhist Wedding, 2012. Activists hoped that the marriage ceremony between You Ya-ting (left) and her partner Fish Huang (right) would help in the campaign to legalize same-sex marriage on the island.

In 2015 the Vietnamese government abolished the ban on same-sex marriage—a sharp departure that not only distinguishes it from other communist/postsocialist states, such as China and Russia that have tightened their control over LGBTQ issues recently but also marks it as the first country in the region to legalize conjugal relationships between same-sex couples (Lewis 2016). By contrast, its close neighbor Thailand has tightened the policing of extramarital sexual relationships, particularly commercial sex work, which is defined by the law as “illegal” but not usually punished by the state in practice.

This move is a sign that the Thai government, under a military regime, is trying to move away from the Western liberal governance it has long embraced, and toward Chinese-style authoritarianism (Pawakapan 2015). In the meantime, while widely known for its LGBTQ scenes and once seen as the first Asian country that might legalize same-sex marriage, Thailand now lags behind Taiwan and might take up the cause again at some point. In other performances, nation-states signal modernity by highlighting heterosexual conjugality as the core of citizenship. For instance, the Hong Kong municipal government not only uses heteronormative kinship as the discursive basis of citizenship defining belonging and exclusion but, more importantly, to also justify ethnicity (being born as Chinese) as the legal foundation to decide citizenship (Yam 2018).
Queering Legal Heteronormativity

Since heterosexual marriage has been a crucial means of access to livelihoods, inheritance/maintenance, and lineage rituals, many LGBTQ groups seek to carve out an alternative space of survival and living within the normative forms of marriage, such as “cooperative marriage” among gay men and lesbians to satisfy their respective families in China recently (Kam 2013; Engebretsen 2014), or marriages of convenience among South Asians. These may be arranged by the individuals marrying, but are deemed in the United Kingdom to fall under forced marriage practices among Asians (Amara 2014). As Amy Brainer’s ethnography points out, strategic marriages by gay men and lesbians in Taiwan are embedded in the logic of patrilineal kinship, property, and labor, such that lesbians have no access to natal, affinal, or matrimonial resources when they adopt the common practice of living in “separation without divorce,” assume the bulk of reproductive labor in households in line with their assigned gender, and are cast out of ritual recognition. Trans men and women have been newly able to navigate laws with some fluidity, retaining property rights of the gender assigned to them at birth or gaining new ritual recognition under their newly adopted gender, but Brainer’s argument is that these forms of embodiment still highlight the norms of patriarchal property transmission (2014). Like Brainer, Wah-shan Chou (2000) also suggests that family-kinship, instead of sexuality, constitutes the basis of individual identity, and thus a homosexual intimate relationship practiced along with/within kinship relationships reinforces rather than unsettles the patrilineal and reproductive logic of the family system in Chinese societies.

While these strategies have social and material advantages, they also illustrate the categorical violence of family law, both in the coercion of living within marriage as a form of survival, and in the dangers of exposure in countries where homosexuality is criminalized. Tanaz Eshaghian’s poignant film Be Like Others (2008) follows gay men in Iran, where homosexuality is criminalized but sex-reassignment surgery is sanctioned and encouraged as a remedy for a medical condition: men ambivalently seek surgery as a way to marry their partners and satisfy their families about gender and marriage, but often end up losing kin connections and livelihoods anyway. Transsexuality has been constituted as a space of livability in Iran, inhabited strategically by queer people even as it serves as a disciplining discourse (Najmabadi 2013). Marriage equality may also be part of civic recognition sought by cosmopolitan, class-privileged groups, and may purposefully shun associations with sexual minorities marginalized by class, livelihood, and region, compounding structural violence (Datta and Roy 2014; Kang 2014).

Often, the authority assigned to patriarchal norms in families means that transgressions in family law are also imbricated with a variety of criminal penalties; gender is flexibly manipulated in legal pluralism for peculiarly punitive effects. A recent case in Bangladesh exemplifies the impunity of criminal law deployed simultaneously with family law, in which
the father of a Muslim woman who had a customary form of marriage with her female Hindu partner had the partner arrested on charges of kidnapping and abduction (a common use of these criminal laws by parents to curb their children’s marriage choices), then forced his daughter into marriage before that case was resolved (Pelham 2016). Vaibhav Saria (2015) highlights a legal case that emphasizes the constant state of exception for those in liminal legal categories: Shamseri, a hijra (a specific religio-cultural community of trans women in India), agreed to marry her brother’s mistress as a cover for the mistress’s pregnancy, only to be brought up on criminal and civil charges for domestic violence and alimony when her brother tried to end the relationship.

Asia’s varied kinship systems also provide a useful reminder that patrilineal patrilocal marriage is not the universal currency of kin entitlements. Through kin networks, people have usufructuary, or use rights, to maintenance and property that may capably incorporate gender flexibility or alternative lines of descent. Unni Wikan (1977) describes the Xanith/Khanith of Oman as a third gender, adopting female clothing and activities and inhabiting female space while having the same access to legal property rights as Muslim men. Hijra communities in India fall under legal precedent that property is transmitted within lineages of gurus and disciples rather than through their biological kin, a right in danger of being forfeited through upper/middle-class marriage equality initiatives where conjugality is placed center stage (Suresh 2011; Manayath 2015).

**Beyond Legal Governance** It is such alternative reckonings that provide possibilities for queering family law beyond calls for state recognition through marriage equality. While LGBTQ demands for marriage are politically prominent negotiations, others have identified templates of practices of queer communities that provide a way to rethink the logic of family law. One way is to restructure kinship and religion based on practice, such that the legal realm is not the only place where rights are granted: Ruth Vanita (2011) uses the case of the marriage of a lesbian couple solemnized in a Hindu temple to posit a path for creating new “customary” practices that then set precedents to be incorporated into family law. Another is to rethink the “family” in law: for example, the Delhi-based organization Partners for Law in Development has long argued for economic rights and rights of social recognition for a number of different kinds of conjugal and marital arrangements that are customarily accepted and durable, as “relationships in the nature of marriage.” These include economic rights for polygamous families, second wives who have no legal rights, short-term sexual-social contracts such as visiting husbands and maitri karar (short-term contracts that may include sex, labor, etc.), same-sex partners, and third-gender partners whose “husbands” may be also married to women (Partners for Law in Development 2010). Such imaginings dislocate the Western nuclear unit as the archetypal subject of family law, and invite us into Judith Butler’s vision for “radical projects” that rethink the governance of kinship (2002, 17).

BIBLIOGRAPHY

The British writer Henry Fielding (1707–1754) coined the term *female husband* in the mid-eighteenth century. Fielding used the term as the title of a criminal biography he wrote in 1746 that was based on newspaper accounts he had read earlier that year. After the publication of Fielding’s work, the term *female husband* went on to appear with relative frequency in the British and US press, most often to describe women who lived as men, or who partnered with other women and took on “masculine” occupations. Of course, this phenomenon most likely predated Fielding’s pamphlet, but with the publication of *The Female Husband*, the Anglo-American world had a label one could assign to this pattern of behavior, and its meaning gained coherence.

**Fielding’s Creation of the Female Husband Character**

Fielding’s pamphlet was inspired by newspaper stories about Mary/Charles Hamilton that had been published in England in 1746. These stories reported that Hamilton was an individual assigned female at birth but who had been living as a male since the age of fourteen. In July 1746 Hamilton married Mary Price in Wells, England, although the marriage was short lived. Indeed, after two months, Mary complained to authorities that her husband was biologically female, and Hamilton was subsequently arrested and placed in prison to await trial, during which he was sentenced to six months of hard labor. When Fielding encountered the newspaper stories about Hamilton, he apparently thought they would serve as the basis of an entertaining narrative, so he fictionalized the account and published a pamphlet titled *The Female Husband* several months later.

Significantly, in fictionalizing the stories that he had encountered, Fielding created a character (the “female husband”) that would go on to have salience across the Atlantic world, including in the United States. In *The Female Husband*, Charles Hamilton married not only one woman but a series of women, whom she/he subsequently abandoned. Hamilton’s masquerade was ended only once she/he was discovered by authorities and flogged. Fielding wrote this pamphlet in a tone of repeated disbelief, with frequent use of the term *surprising*. 

Eighteenth- and nineteenth-century term used to refer to an individual assigned female at birth who posed as a husband to a woman.
Perhaps on account of its tone, the pamphlet was an instant hit and sold out two runs of 1,000 copies each in November 1746. This pamphlet had a wider circulation than the newspaper accounts of Hamilton’s life, and as such, it served to introduce many throughout Britain and the Americas to the idea of a female husband. The term quickly gained traction, and soon journalists on both sides of the Atlantic were using the term to refer to individuals who were assigned female at birth and who lived as husbands to women, but it was also occasionally used to refer to individuals who simply took on traditionally masculine occupations. Importantly, the tone Fielding used to describe Hamilton carried on as well; as Rachel Hope Cleves has written, female husbands were often perceived as “objects of bemusement rather than existential threats to the gender order” (2015, 1064). In this sense, the term female husband was often used to poke fun at its subject—to ridicule him/her as absurd or ridiculous.

Indeed, the term appealed to many journalists in the late eighteenth and nineteenth centuries because it seemed, on the surface, to be an oxymoron. At that time in the Anglo-American world, women were defined through their status of dependency either on their father (in childhood) or on their husband (in adulthood). The figure of the husband was seen as the caretaker of dependents, and therefore the phrase “female husband” drew attention to itself as being a formulation clearly outside the boundaries of normative gender expectations (Clayton 2010). To audiences, however, the term might have suggested things beyond what Fielding and others intended: that gender is elastic and that some individuals assigned female at birth might want to live as men and/or marry women.

Although it is unclear how audiences interpreted the term female husband, it is clear that the term was used with relative frequency in the Anglo-American press from its first use in 1746 until the late nineteenth century. Indeed, while most stories about female husbands characterized their subjects as wholly unique, by the nineteenth century most newspaper readers in Anglo-America would have recognized this figure as a common character. For example, in 1838 the Barre (Massachusetts) Weekly Gazette published a story under the headline “Another Female Husband,” suggesting that the editors understood that this was not the first story of a female husband that their readers had ever encountered.

**Historical Insights on Gender and Sexuality**

The term female husband proposes two overlapping insights into the history of gender and sexuality. First, it reveals that in the eighteenth and nineteenth centuries there were many recorded cases of individuals who were assigned female at birth but who lived, for at least some time, as men. While it is impossible to determine what motivated this movement away from the sex assigned at birth—and no doubt there was a range of different motivations among female husbands—this phenomenon nonetheless serves as a reminder that gender transgression has a long and storied past. Second, it is likely that some of the individuals referred to as female husbands would, if they were alive today, identify has
transgender.

Of course, it is also likely that some individuals labeled female husbands did *not* identify as men, but rather posed as men in order to live out their romantic and/or sexual desire for other women. The existence of a category of “female husband” suggested to women in the late eighteenth and nineteenth centuries that a range of types of marriages are possible, including marriages between two women. As Cleves has written, “The diversity and longevity of stories about female husbands leads to the conclusion that this form of same-sex union, in particular, had cultural legibility within American society…. Many women believed it possible, and found it possible, to form marriages with other women” (2015, 1067).

Additionally, there is evidence that some female husbands and their wives were able to find tolerance of their queer relationships in early America. Charity Bryant, for example, was a woman who lived in New England in the nineteenth century. Although she did not pass as a man, she served the role of husband to her female partner, Sylvia Drake, and the townspeople of Weybridge, Vermont, and family members accepted them as a married couple. Indeed, this acceptance is commemorated in the headstone that the couple share, buried side by side, just like the other married couples in the village (Cleves 2014, 2015).

By the end of the nineteenth century, use of the term *female husband* in US newspapers began to wane. The individual who has the dubious distinction of being the last person referred to in the mass circulation press as a female husband is Frank Dubois, who gained national attention in 1883. Dubois had been assigned female at birth and had married and given birth to two children before he ran away from his family and began living as a man, starting a new life in the small town of Waupun, Wisconsin. In Waupun, Dubois gained a reputation for being a hardworking individual, and he met and married a young woman named Gertrude Fuller. Everything proceeded happily until Samuel Hudson, Dubois’s former husband, came to Waupun looking for him—at which point Dubois and Fuller went on the lam, running from Hudson, the authorities, and journalists who scrambled through the Wisconsin countryside looking for the couple. The manhunt was covered in newspapers nationwide, and Dubois was referred to as a female husband, along with other terms, such as *insane freak* (Grand Forks [North Dakota] Daily Herald, 30 October 1883).

Dubois’s tenure in the press placed him and Fuller in the spotlight along with the term *female husband*. This prompted many Americans to consider the term, its implications, and the possibility of such queer relationships. For example, the *New York Times*, on 4 November 1883, published a satirical editorial wherein the author poked fun at the idea of women performing the role of husband, writing, “What more could a New England spinster desire than a husband who never smokes, swears, or slams the door; who keeps his clothes in order, and does not stay out of the house until late at night, and who reads Emerson, understands the nature of women, and can discuss feminine dress with intelligence and
appreciation?” This editorial was designed to poke fun at the idea of a woman serving as husband, but of course it was written in such a way that individuals who desired (or who were participating in) a queer relationship might have found it validating. As such, this editorial highlights how multivalent the term *female husband* was; it was at once a sensational and singular term, but it was used to describe a fairly widespread phenomenon throughout the eighteenth and nineteenth centuries (*Skidmore 2017*).

### Waning Use of the Term

However, the late nineteenth century gave rise to sexology, the medical science devoted to studying human gender and sexuality. Early sexologists were very interested in understanding sexual and gender deviance, and they defined a new category that soon supplanted the notion of female husbands in the popular press: the female sexual invert. According to the sexological theory of sexual inversion, homosexuality was the result of an inborn reversal of one’s gender characteristics, and thereby masculine women “naturally” desired women. By the 1890s the figure of the female sexual invert had become an identifiable figure in the mass-circulation press, particularly within sensational newspapers published in large metropolitan areas (*Duggan 2000*). Importantly, the female sexual invert was defined in the press as a pathological figure, one that threatened the stability of heterosexual relationships because her sexual object of choice was the “normal” woman. In this context, the term *female husband* fell out of favor, because the mainstream mass-circulation press was increasingly interested in portraying nonnormative relationships as clearly deviant. Even though the term *female husband* had the potential to be interpreted in a positive light, after the 1880s, that was something many newspaper editors were seemingly uninterested in.

Overall, the term *female husband* was used in the Anglo-American press for about 150 years. While Fielding’s coinage of the term may have been with the intent to ridicule the idea of individuals assigned female at birth serving as husbands, the term quickly gained salience as a social formation that conveyed the possibility of queer relationships. Even though the term has fallen out of favor, examining its history reveals to modern audiences a queer past wherein individuals moved from one gender to another, and wherein queer relationships could, at times, be tolerated.

Feminism, African

JANE BENNETT
Associate Professor, School of African and Gender Studies, Anthropology and Linguistics
University of Cape Town, South Africa

The ways African feminists have intersected with queer theory and activism.

There is a very long history of Africa-based women, in diverse national contexts, who have organized against oppression. Consider, for example, the 1929 Igbo Women’s War, which took on British colonial policy in Nigeria, and individuals such as Wangari Maathai in Kenya, who drove forward a powerful popular movement known as the green belt movement around issues of land, poverty, and agriculture. It is important to recognize the depth and resonance of this history, but it is also useful to understand that the term African feminism is best applied to theorists and activists who used the term themselves to describe their work. Obioma Nnaemeka, for example, is one of several Africa-based feminists who have contributed to vigorous debate during the last three decades of the twentieth century on the meaning of African feminism as an umbrella concept. She has argued that “there is a pluralism of … [African feminisms] that captures the fluidity and dynamism of the different cultural imperatives, historical forces, and localized realities conditioning women’s activism/movements in Africa … [that] underscores the heterogeneity of African feminist thinking and engagement as manifested in strategies and approaches that are sometimes complementary and supportive, and sometimes competing and adversarial” (Nnaemeka 1998, 5). Nnaemeka’s rejection of a homogenizing narrative on African feminism refuses to dislocate theoretical work from grounded, complex, and often mutually unintelligible contexts. Such an approach works well as an introduction to a critical discussion of African feminist theories’ and activisms’ engagement with continental and global queer theory and sexualities studies.

This entry is structured in three sections, the first of which presents some of the dominant ideas in African feminist theory since the 1970s. Such theory emerged from critical activism and thought concerning the meaning of decolonization and pan-Africanism after the 1960s wave of independence from colonial governances. Located in movement building, research spaces, and cross-country networks, such feminisms took inequities in gender dynamics very seriously, theorizing these as responsible for major injustices in terms of access to political space and the meaning of gender-based violence, and overall for the perpetuation of colonial regimes of gender and race. Although there are serious debates among these voices, there are also some points of consensus, and it is possible to foreground particular voices as key to understanding contemporary feminist organizing
and thought on the continent. The second section explores the iterative relationship between African feminisms and queer and LGBTI activism and theory on the continent. It concludes with the argument that even though particular African feminists (such as Sylvia Tamale of Uganda and Elizabeth Khaxas of Namibia) and sexual and reproductive justice organizations (such as the Sexual and Reproductive Rights Coalition in South Africa and the International Centre for Sexual Health and Reproductive Rights in Nigeria) have played critical roles in African queer work, the work of African-based LGBTI and queer activists, artists, and writers has influenced African feminism more effectively than the other way around. The final section looks very briefly at the influence of African-generated LGBTI and queer work on the meaning of contemporary African feminisms, but the overarching argument is that there remains an ongoing tension for feminists and/or queer theoreticians and activists between working on the continent and working globally (Ocholla 2010).

**Defining African Feminism**

Following Nnaemeka's caution about simplistic readings of continentally generated theory, Jane Bennett goes further:

> [What is] critical to recognize is that it is impossible to speak of Africa as a generalization without erasing complexity, nuance, and difference. The continent is vast, and its civilizations, peoples, languages, and histories are extremely rich.... In a very real way, there is no such thing as Africa, except as such a space is highlighted and debated in opposition to the discourses that stereotype the continent as undeveloped, its peoples as incapable of self-governance or poor, and its cultures as primitive. Such discourses abound, even in the twenty-first century, and when we seek to understand questions of African-based activism in the area of ... sexualities it is important to try to do so in a way that respects the depth and complexity of the political, social, and historical realities of the continent.

*(BENNETT 2011, 80)*

Despite the recognition of the dangers of homogenization, there are several arguments within feminist theory and activism that are explicitly named as “African.” Such arguments wrestle for prioritization and perspective, as is to be expected in robust and resilient
political thought.

Many of the arguments are positioned in direct, and proactive, response to—and rejection of—feminisms developed by middle-class and white feminist writers, particularly those in the United States and United Kingdom in the 1970s and 1980s. The notion that “sisterhood is global” (sloganized by US feminist Robin Morgan) is understood here as a form of colonialism, and in addition, a weakly theorized understanding of the production of gendered forms of power. Oyèrónké Oyèwùmí in *The Invention of Women: Making an African Sense of Western Gender Discourses* (1997) argues strongly that Western feminism focuses on the meaning of the body in a way utterly foreign to the Yoruba ontological frameworks for conceptualizing the “human.” Her position refuses the notion of a “womanhood” separable as a class from “manhood,” and draws on the Yoruba language and Yoruba patterns of community hierarchy to theorize Western concepts of gender as irrelevant to African epistemologies. Ife Amadiume takes on a similar task. In *Male Daughters, Female Husbands* (1987) Amadiume theorizes matriarchal systems of economic and political formation in Nnobi, Nigeria, stressing that gender is only one of many interlocking influences on the operation of power, access to resources, and symbolic meaning. Amadiume takes cultural ritual, particularly around issues of fertility and sexuality, very seriously as processes of enormous power for women at specific stages of their lives.

A second argument, loosely allied to the work of African feminism, comes from the adoption of new terminologies for an African-generated feminism. Mary Kolawole, for example, in *Womanism and African Consciousness* refutes the impotence of women living on the continent. She defines womanism as the “totality of feminine self-expression, self-retrieval, and self-assertion in positive cultural ways” (Kolawole 1997, 31). With Nnaemeka, Kolawole supports a womanism that advocates for negotiation (“nego-feminism”) between the cultural power of womanhood and men’s forms of authority, so that any inequalities between men and women can be resolved. In some ways, this womanism resonates with African American writer Alice Walker’s definition of womanism in that Walker, explicitly conscious of the roles of racism and class oppression in the lives of men of color in the United States, rejects any blanket relegation of men to the status of the privileged. Walker’s embrace of ordinary (poor, and usually black) women’s art and weaving work as versions of feminist theorizing is not too distant from Kolawole’s celebration of African women’s “ways of being,” but the concepts are separated by political and contextual roots.

A 1997 collection of essays titled *Engendering Social Sciences in Africa*, edited by Ayesha Imam, Amina Mama, and Fatou Sow and published by the Council for the Development of Social Science Research in Africa (CODESRIA), bears witness to a very different thread in African feminist theory. The collection explicitly takes on the decolonial but androcentric epistemologies of some of the leading African scholars of the 1970s to the 1990s, including
Thandika Mkandawire, Archie Mafeje, and Mamadou Diouf. Structured through engagement with diverse disciplines, such as history, psychology, education, theories of culture, agricultural studies, and economics, the volume analyzes late twentieth-century theory that purports to effect revolutionary change in the production of African knowledges and finds it gender-blind, even antifeminist. The writers, all of whom galvanized significant feminist projects of policy making, movement building, and research in their own national contexts, are some of the leading names in contemporary African feminist organizing and thought on the continent. Collectively, this trajectory of African feminist thought takes the postdemocratic African state very seriously as a site founded on both the unfinished work of decolonization and the operation of patriarchal and militaristic forces, and it demands epistemological transformation of the ways in which knowledges, and hence strategies, are created. In this way, feminist analysis of gender dynamics informs every layer of institutional, organizational, and personal work toward African-centered sociopolitical change. Takyiwaa Manuh, Sylvia Tamale, Amina Mama, Ayesha Imam, Dzodzi Tsikata, Marjorie Mbilinyi, Charmaine Pereira, Ruth Meena, Fatou Sow, Rudo Gaidzanwa, Hope Chigudu, Elaine Salo, Pumla Gqola, and Desiree Lewis constitute a transnational network of African feminist theorists and researchers allied within this thread of African feminism despite their very different country contexts.

While it is possible to see glimpses of liberal feminism in, for example, the election of women to high political office (such as Ellen Sirleaf-Johnson’s election as president of Liberia in 2006) and ongoing developmental organizations’ concern with gender mainstreaming, popular African feminisms owe much to their predecessors’ theorizations of land, class, race, and sexuality. Yet, they have taken up an African feminism deeply engaged in grounded movement building that is also fluent in the language of social media. This thread of African feminism is young, and in a country such as South Africa, strongly attuned to the politics of race and land dispossession, fueling student movements, and impatient with earlier generations’ concern with the quantification of women politicians in terms of quota policies or concerns about the ratio of women to men in political office. Blogs such as those by MsAfropolitan, Dr T. (Tlaleng Mofokeng), Sokari Ekine, and Nana Sekyiamah reflect on both the politics of the body and the meaning of histories that have, globally, deployed race and gender to build exploitative economies.

A final thread that must be included in this brief introductory survey of African feminisms is Islamic feminism in Africa. As Shirin Edwin points out, Islamic feminism is often neglected in discussions of African feminisms that otherwise recognize the continent’s diversity and complexity. Edwin argues that some African feminists stereotype Islam, but that “Ayesha Imam’s work on the seclusion of Muslim women (kulue) and on the history of Islam in northern Nigeria offers a deeper and more objective understanding of the role Islam has played in the lives of women in northern Nigeria from the fifteenth century through independence from British rule” (Edwin 2006, 142). In addition to Imam, Nawal El Saadawi, an Egyptian feminist, is one of several voices speaking about the complex
relationship between rejection of Islamophobia and passionate and informed advocacy for Muslim women's power; Fatou Sow, Fatima Mernissi, and Fatima Seedat also address this issue.

The diversity of African feminisms animates a continent-wide engagement with the dynamics of gender as these have arisen historically and contextually. While there are clear conversations with feminisms borne out of struggles on other continents (particularly those with legacies of slavery and colonial rule), African feminisms are at their most influential in dialogue with one another. The website of the African Feminist Forum, for example, profiles dozens of activists and writers, and a drilldown into biographies, leaderships, theories, and experiences bears witness to both the strength and the range of “African feminisms.”

**African Feminisms and the Politics of Sexualities**

It could be argued that all threads of African feminism speak, in different ways, to the politics of sexualities. However, such an argument would conceive of sexualities very broadly, encompassing the examination of Islamic texts’ construction of sexuality, the meaning of very diverse heterosexual cultures and norms, the political economy of unpaid “domestic labor,” the robust engagement between legal reform and questions of reproductive and sexual health, the political economy of sex work, and the ongoing negotiation between medical- and social science–oriented debates about the prevention and management of HIV/AIDS. The terrain is rich and dominated by two overarching concerns: the meaning of complex and changing sexualities and the need to challenge stereotypic and stigmatizing Western discourses on “African sexuality” (*Tamale 2011*).

Overall, though, until very recently, African feminisms have been slow to theorize sexualities and genders beyond the borders of heteronormative epistemology. A bird’s-eye view suggests that it has been African lesbian, gay, transgender, intersex, and queer activists and writers (often living in contexts where their counterheteronormativity is criminalized) who have influenced African feminisms, rather than the other way around.

There are two spaces in which the influence of African feminism on queer activism and theory can be articulated. The first arises from African feminist organizations’ and policy makers’ challenges of early discourses on the prevention of HIV/AIDS. When the HIV/AIDS virus spread very rapidly across Africa south of the Sahara in the late 1990s, state responses to the devastating epidemic included public sex-education campaigns that demanded that populations “abstain, be faithful, condomize” (ABC). Sociomedical research simultaneously constructed groups “at risk”—long-distance truck drivers, sex workers, and young female partners of “sugar daddies”—and advocated for special campaigns focused on these groups’ vulnerability. It took feminist organizing and writing to challenge the narrowness of the state approach to what constitutes “sex” and “violence” (*Muthien 2004*) and to demand new approaches to possibilities for sexual partnership. Feminist demands
to consider gender-based violence, to take the complexity of sexual lives seriously, and to acknowledge diversities of sexual life, community, and culture changed many approaches to understanding the epidemic (Horn 2013).

The second space involves the persistent work of particular African feminists and organizations that—as feminist partnerships—have stood their ground against both state homophobia and progressive civil society networks to insist on the rights of lesbian, gay, and transgender people. Sylvia Tamale of Uganda is one such African feminist. In 2003 Tamale, then associate professor of law at Makerere University (where she later became dean of the faculty of law) was pilloried by a leading newspaper, the *New Nation*, as one of the “worst women in the world.” The reason was her political support for lesbian, gay, and transgender people as “minorities” for the purposes of new draft equity legislation. Tamale’s position as a well-known feminist stimulated open and virulent homophobia as well as feminist engagement in eastern Africa around the need to name the violence and advocate for protection of LGBTI people. From 2004 to 2005 Urgent Action, a feminist organization fighting for women’s rights based in Nairobi, Kenya, directed at that time by Kaarai Betty Murungi, initiated a series of research projects and workshops that sought to better understand the discrimination suffered by East African LGBTI people and activists. Some of the most influential activists in the region, including Victor Mukasa, Frank Mugisha, David Kato, and Kasha Jacqueline Nabagesera, participated in discussions, and the networks created lent strategic support to a number of fledgling LGBTI organizations. Freedom and Roam Uganda (FARUG) and Sexual Minorities Uganda (SMUG), for example, grew to become leading advocacy voices in the battle against the recriminalization of lesbian and gay people in Uganda beginning in 2009.

Sylvia Tamale remains a well-known feminist ally in LGBTI activism, and her colleague Stella Nyanzi proactively researches questions of queer community in Uganda. Similar connections between African feminists and LGBTI activism can be found in other contexts. In Namibia, the feminist organization Sister Namibia produced a regular and influential newsletter run by Liz Frank and Elizabeth Khaxas, and wove questions of LGBTI knowledge making into its programs on feminist issues from its earliest instantiation. In Nigeria, Dorothy Aken’ova, a feminist working with civil rights, spearheaded a 2006 protest against the newly proposed recriminalization of lesbian and gay people (Aken’ova 2011). More recently, in 2017, Charmaine Pereira and Bibi Bakare-Yusuf, both influential feminists working in Nigeria, completed research on gender and sexual diversity for the Initiative for Equal Rights (TIERS), an organization committed to documenting discrimination against LGBTI people in Nigeria. Pereira and Bakare-Yusuf’s engagement with the research is typical of the way African feminisms have contributed to LGBTI and queer African-based work—that is, it is driven largely by their own politics and vision rather than as part of an organizational strategy linking the theorization of feminism to the meaning of queer justice.

In South Africa (one of only two countries on the continent that has removed colonial-era
legislation against homosexual behavior, as of 2018), the interaction between feminists and LGBTI activism has been complex. Although several leading LGBTI knowledge creators and activists are outspokenly feminist—including Sibongile Ndashe, Zanele Muholi, Funeka Soldaat, Mary Hames, Dawn Cavanagh, Liesl Theron, and Sally Gross—and bring diverse principles of feminist work to LGBTI strategizing, debates within South African feminisms have concentrated more intensively on the theorization of race, class, and the meaning of “womanhood” under the South African state than on the priorities of queer thinking. That said, it is worth noting that South Africa’s leading feminist journal, *Agenda*, has published several special issues on queer theory and the politics of counterheteronormative activism (*Matebeni 2014*), and that the Sexual and Reproductive Justice Coalition encompasses feminist and queer advocacy and theory as mutually enriching activisms.

### LGBTI, Queer Theory, and African Feminisms

Since 2000, the growth of African-rooted LGBTI and queer work has been expansive, diverse, and—despite the legal and sociopolitical hostility of country contexts—highly influential in debates within African feminisms, particularly those driven by younger voices interested in the politics of performance and the power of social media to affect change. Some conversations, especially those focused on the legally guaranteed human rights of lesbian, gay, intersex, and transgender people, led by organizations such as the Coalition of African Lesbians and the Initiative for Strategic Litigation in Africa, require specialist knowledge of the international legal terrain, and are rarely glossed in popular African feminist e-debate. Others, however—such as those concerning the meaning of violence, the power of the visual, decriminalization of sex work, and the need to challenge the legacies of colonial borders of many types—are very strongly driven by the work of lesbian, gay, bisexual, transgender, and intersex writers, artists, activists, and strategists.

*Queer African Reader* (2016), a collection of essays coedited by Sokari Ekine and Hakima Abbas, exemplifies the range of continental queer theorization on space, solidarity, religion, and culture, and the politics of movement building. The collection has been widely distributed internationally, placing African queer debate squarely within global discussions. In a similar way, the visual activism, or photography, of Zanele Muholi, representing the “face and phases” of black Southern African lesbians and transgender people, has travelled the world’s museums and galleries. In 2004 Muholi was also the first South African to write about the rapes and murders that target black South African lesbians. Her influence on the theorization of black embodiment in a twenty-first-century global and African context is monumental. Alongside Kasha Jacqueline Nabagesera of Uganda, whose LGBTI activism put her on the cover of *Time* magazine (5 August 2015), and Binyavanga Wainaina of Kenya, who won the Caine Prize for African Literature in 2002 and was named one of *Time*’s most influential 100 people in the world in 2014, Muholi stands as a major African figure of queer Africanity. These voices, together with others, carry
debate into conversation with African feminisms and beyond.

Despite the success of particular queer theorists and artists coming from and working both within African contexts and further afield, divisions remain between historical legacies of some African feminisms and new LGBTI and queer agendas that refuse any reification of the body. Akinyi Ocholla captures this in autoethnographic research exploring her experiences working as a feminist, Kenyan, lesbian, and international queer activist; she points out the tensions in navigating the meaning of African struggles with US-dominant global ideas of queer vision (Ocholla 2010) alongside the need to understand the multiplicity of African feminist understandings of gender dynamics.

BIBLIOGRAPHY

Femmes and butches occupy a central, if contested, position in lesbian history. The terms *butch* and *femme* defy easy definition as women have adopted and adapted these identifiers in diverse ways to reflect queer identities and desires since they emerged as foundational concepts of public lesbianism in the 1940s. For the next few decades, these women were the only visible figures of queer womanhood. Commonly understood in relation to one another (stylized in a variety of ways, such as "butch/femme" or "butch-fem"), lesbians developed these concepts to make their sexual desire visible and to create a social system through which to build community. The growth of the queer community and the evolution of social, cultural, and political beliefs about sexuality created a number of challenges to the utility and legitimacy of femme and butch identities, yet they continue to function as significant ways of making meaning among queer women.

**Background**

Until the late nineteenth century, Americans generally understood same-sex sexual engagements as standalone acts or behaviors rather than an indication that participants were inherently different. Industrialization, urbanization, and large-scale movement of peoples around the country created new conditions that facilitated the growth of queer identity and subculture by the onset of the twentieth century. Women found that these changes provided new opportunities for employment that translated into greater independence from family and gender norms. These changes also came with more time spent in homosocial spaces and greater access to leisure activity. At the same time, there was an increased recognition of women’s sexual agency. An understanding of women’s sexuality independent of men opened up opportunities for women to understand their desires and marked women as sexually available to one another. Medical inquiry into gender and sexuality coincided with subcultures developing around homosexual activity, the two helping along the transition from homosexual practice to identity. Initially, these sexologists interpreted same-sex sex as gender inversion. They asserted that a woman desiring another woman actually experienced these feelings because she understood
herself as masculine rather than feminine. Sexologists moved rather quickly from ideas of inversion to defining those people who engaged in same-sex sex as a category of people: “homosexuals.” The idea of gender inversion lingered well into the twentieth century, however, especially for women (Rupp 1999; Stein 2012).

Prior to these developments, history offers glimpses of “passing women” who presented themselves as men. The restrictions placed on women’s lives before the twentieth century make it complicated to determine the influences of gender identity, sexual desire, and a drive for independence in interpreting the motives of passing women. Passing women held jobs that would have been otherwise off limits, such as soldiers, laborers, and politicians. These roles provided independence and adventure, attractive to those women who described childhoods chafing under the restrictiveness of femininity. This life also frequently included female companionship, with many passing women taking wives. Romantic friendships provided a model for female intimacy, although the absence of gender roles may have complicated sexual unions in such partnerships. These women were important predecessors to butch women inasmuch as they situate the ongoing struggles of

A Butch/Femme Lesbian Couple at the 1982 Gay Pride Day Celebration in New York City. Lesbians developed the concept of butch/femme to make their sexual desire visible and to create a social system through which to build community, starting with the onset of World War II. During the 1970s, some militant lesbian feminists began to argue that this gendered representation of lesbians actually promoted the oppression of lesbians of all types.
women to find ways in which to locate a gender identity that is something other than feminine, to express sexual desire for other women, and to reject the gendered barriers to employment and independence (Katz 1992).

The mannish lesbian marked an important transition from the passing woman to the butch; she represented lesbian sexual desire and the ongoing connection between queer womanhood and the subversion of gender norms. The scholar Esther Newton defines the mannish lesbian as a woman whose lesbianism is visible through “behavior or dress” that “manifests elements designated as exclusively masculine” (2000, 177). While this mannish figure emerged in the early twentieth century as a public expression of queer female desire, lesbian community continued to develop primarily outside of public attention. By the 1920s a small number of lesbian subcultures developed as a result of early twentieth-century social changes, exposure to Freudian theories, and bohemian rejections of Victorianism. This included working-class lesbians who began to gather in public houses. Even among mainstream society, increasing numbers of women began to explore sexual desire for other women (Faderman 1991). In spite of rapid change, most women continued to have less access to spaces for public gathering and had to mind cultural values in order to maintain economic and social stability. It took a radical transformation of American society in the coming decades to make public lesbian communities possible.

Rise of Butch-Femme Community

The onset of World War II (1939–1945) made possible the creation of public lesbian community. Men mobilized for military service, necessitating women’s accelerated entry into the workforce and thus creating opportunities for independence and homosociality. They migrated around the country to power wartime industries and join the military and in so doing found new opportunities to live, work, and socialize with one another. In this new world, lesbians also found financial freedom, distance from the watchful eyes of family, and refuge in the wartime flexibility of gender norms. The paucity of men normalized women moving about in public without the company of men. The upsurge of working women in nontraditional fields normalized a greater range of women’s clothing, including pants. Lesbians became less conspicuous, facing fewer dangers as they traversed public spaces and finding greater opportunity to build subcultures. Under these conditions lesbian community flourished in bars. Most public spaces would not accept overt displays of lesbian activities or were not safe for women to do so. Bars, especially those “in areas known for moral permissiveness,” provided the only consistent option for lesbian socializing (Kennedy and Davis 1993, 31).

“Butch” and “femme” materialized in the 1940s as varied configurations of lesbian gender and sexuality, identity and practice, independent character, and reciprocal role. The simplest definition is that butches appeared and behaved masculine, whereas femmes appeared and behaved feminine. In this conceptualization, the femme identity relied
heavily on attraction and attachment to the butch in order to be legible. Butches adopted the clothing of working-class men and styled their hair short, whereas femmes maintained conventional fashions for women of the period. Commonly replicating the gender roles of heterosexual couples, the butch was the dominant partner and sexual aggressor with the femme yielding to and caring for her butch. In the early twentieth century there were few other partnership models, so it is not surprising that lesbians looked to heterosexual roles in order to make sense of their desire. Butch/femme roles further provided a means of structuring community relationships. Given that butch/butch and femme/femme relationships were taboo, the gender norms of these roles guided social interactions and expressions of sexual desire. Yet butch/femme partners were hardly naive copies of husband and wife. Rather than a form of imitation, femmes and butches transformed gender roles to suit their needs and even understood the butch/femme relationship as a political act of subverting the norms of the period. Subsequent generations of lesbians challenged the legitimacy of butch/femme identities but have been unsuccessful in challenging their importance to queer women's community.

These identities filled a number of needs among women who felt in some way limited by existing sex and gender roles. Identifying as butch required a more overt deviation from traditional gender norms and grew out of an internalized sense of difference. Presenting as butch was, for some, a natural expression of female masculinity. For those who felt misgendered as women, living as butches was the closest option to living as men. In this case the butch role functioned more as a gender identity than as a sexual one. In addition to any gendered meanings, distinguishing oneself as butch was a means of declaring sexual interest in (femme) women. Making this desire public was an act of rejecting gender norms and claiming privileges typically reserved for men. Butches made visible the fact that women could be active sexual agents. Femmes typically were not visible on their own even as they understood this role functioned as an identity that shaped the ways they went about their daily lives. While femmes seemingly did not transgress traditional gender norms, they rejected what was arguably the most important tenet of womanhood: being sexually available for men. Some femmes understood this identity as a form of lesbianism, whereas others felt that partnering with butches left their (hetero)sexuality unchanged. Her presentation meant that she could pass when on her own, but with her butch she demonstrated that women were capable of living free from the support or control of men. So while the relationship appeared a facsimile of heterosexuals, by marking themselves as butch and femme, queer women claimed sexual agency, flouting gender norms and rejecting a social structure that defined women as objects for male desire (Kennedy and Davis 1993).

Not all women who loved women embraced these roles with equal enthusiasm; some rejected it outright. Wealthy and middle-class women were not inclined to frequent bars. They were reticent to enter the neighborhoods where these bars were located, and they feared the exposure possible when entering an establishment associated with deviant
sexuality. Upper-class women had resources that allowed them to build social networks elsewhere, and professional women relied on private gatherings rather than risk being found out and losing their jobs or risking familial ostracism. African American lesbians were also reticent to take part in this bar culture. The racism they found there made them feel uncomfortable, even unsafe, and ensured they were not likely to find other black lesbians there with whom to socialize. Black lesbians created their own semipublic social communities through house parties. While removed from the bar scene, they too developed gendered dynamics with masculine “studs” and their femme ladies. This dynamic is an important indication that butch/femme roles had utility for lesbians outside of bar culture. Even among those who were willing to frequent bars, not all found the butch/femme roles natural or appealing. Those anxious to belong to lesbian community adopted whichever of the two felt most fitting or the least objectionable. They otherwise risked being labeled a “kiki,” the derogatory term for those women who identified as neither role and thus did not fit into the structure of the butch/femme world. In spite of these concerns and limitations, butch/femme culture was a vitally important political phenomenon. By making lesbianism visible, this culture helped queer women understand their desires and find safe spaces in which to explore their feelings, develop friendships, and find lovers. Femmes and butches functioned as the primary figures of lesbianism through the 1960s. They did not disappear after this date; instead, new options slowly opened to queer women.

**Homophile Movement**

Lesbians in search of alternatives to bars or the butch/femme system created a new vehicle for political activity. A small number of gay men and lesbians mobilized in the 1950s to advocate for social acceptance of homosexuals. Known as the homophile movement, this group of people evolved toward greater political advocacy in the 1960s. Lesbians created a women-only group, Daughters of Bilitis (DOB), in 1955. Founders initially hoped to create a social alternative to the bar scene, but the group quickly evolved into a political organization with extensive programming and its own publication, the *Ladder*. The DOB advocated assimilation as a means of achieving acceptance within mainstream society. This meant accommodating traditional gender norms. Their argument that lesbians were no different from straight women other than in whom they loved silenced those women for whom lesbianism was an expression not only of sexual desire but also of gender nonconformity. Leaders called on participants to wear traditionally feminine clothing at events, and the *Ladder* published indictments of butch lesbians. Some held a genuine belief that roles were unnatural and that all lesbians (all women) should embrace their femininity. These women interpreted butch/femme presentation as a phase through which lesbians tried to make sense of their sexuality. More commonly, however, homophile women rejected femmes and butches because they understood their visibility as a barrier to the political expediency of assimilation. The DOB succeeded in offering an alternative to butch/femme culture, but in so doing it established similarly rigid boundaries to inclusion.
Yet this position is only one part of a more complex story. While rejecting butch/femme identities as problematic role-playing that prohibited lesbian acceptance, members commonly expressed leanings toward masculinity or femininity. The DOB’s presidential message in the second issue of the *Ladder* emphasized that members were “women first” but went on to state that they were “butch or fem secondly” (Griffin 1956, 3). Founders Del Martin and Phyllis Lyon explained that early in their relationship they had a “butch-femme relationship” and later viewed their early selves as “caricatures in a heterosexual marriage” (1991, 72). They came to reject their various preferences as markers of masculine or feminine identities. Homophile activists were predominantly middle-class women, often professionals who relied on feminine respectability for job security. Yet the DOB’s own research indicates that a butch/femme spectrum was also important to self-understanding among middle-class women as well. In 1958 the DOB circulated a survey via the *Ladder*. It sent out over 500 questionnaires that included questions about “sex roles,” asking how lesbians identified in their relationships. Of the 157 responses it received, 37.6 percent identified as masculine, 36.3 percent as neither, and 21.2 percent as feminine, with 5.1 percent declining to answer (Lyon 1959). Respondents, the majority of whom earned an above-average income, worked to qualify their answers by commenting that their identification was fluid depending on their partner or that they held both masculine and feminine traits. These responses and comments indicate that homophile objection to butch/femme culture may have been more an issue of objecting to association with working-class lesbian culture than it was a rejection of gendered experiences of their sexuality. While the DOB worked to present themselves as “normal” women and change public perceptions of lesbians, it was the feminist interpretations of queer womanhood that finally supplanted femmes and butches on social perceptions.

**Lesbian Feminism**

In the 1970s the militant lesbian feminist became the new lesbian stereotype. Femmes and butches did not disappear; instead, the social and political shifts of the day diversified the types of lesbianism open to women, and media coverage of the new social movements propelled a new lesbian figure into the spotlight. In the latter part of the 1960s young lesbian activists found that the women’s liberation movement was resistant to addressing the political aspects of queer sexuality and that gay men failed to take seriously the gendered nature of lesbian oppression. Queer women responded with the creation of an independent lesbian feminist movement primarily aligned with the goals of the women’s movement but organized around ideas of lesbian separatism. Early theorizing introduced the concept of the “woman-identified woman” or the “woman-loving woman,” which asserted that lesbians were those women who directed all their energy toward one another, rather than toward men. They rejected existing definitions of women’s roles and sexualities as concepts that had been used to keep women oppressed. In this framework, any behaviors that seemed to replicate traditional heterosexual relationships, such as the
butch/femme dyad, propped up the patriarchy. Lesbian feminists commonly adopted androgynous dress meant to reject a gender binary and contrasted this to the “role-playing” of bar lesbians.

Though using a different line of reasoning, lesbian feminists joined the DOB in arguing that femmes and butches harmed rather than aided social and political progress for queer women. And as with homophile activists, the members of this new movement set about creating social and political alternatives to what they saw to be the restrictive limitations of the bar culture. This included liberation groups, women’s centers, bookstores, and music festivals, among much else. These were spaces designed for the celebration of womanhood and thus had no room for those who identified with or were attracted to any practices associated with the trappings of masculinity. Through much of the 1970s, new lesbians continued to find the bar scene the most visible entry into community, although increasingly women’s spaces offered an alternative. This speaks both to the desire for greater variety in models of lesbianism and to the longevity of butch/femme culture (the bar). Lesbian feminists’ rejection of butch/femme culture functioned as a stated rejection of bar culture, even as they continued to turn to lesbian bars as a site of lesbian socializing. This brought lesbian feminists and butch/femme lesbians into contact and conflict. That lesbian feminists had this option demonstrates that their emergence did not replace butch/femme culture. While much of it was maintained by older women who found their lesbianism prior to the new political moment, young, primarily working-class women continued to join their ranks, although possibly at lower numbers given that the women’s and gay movements represented new alternatives for young queers.

Beginning in the 1980s, the adoption of butch/femme culture by activists and scholars further expanded its possibilities. Butches and femmes gained visibility within lesbian feminism in the early 1980s through the feminist debates over sex and power known as the sex wars. While fought primarily around the issues of pornography and sex work, the larger issue of the place of power in sex drew all manner of practices into the conversation. By engaging this issue, those lesbians who were butch/femme-identified and those who found pleasure in consensual power play newly articulated the political implications of this culture and expanded the settings in which it was visible. Queer theory emerged by the onset of the 1990s, further recasting interpretations and practices of femme and butch. Theorists challenged the idea of fixed identities, reframing gender and sexuality as something people do rather than something people are. In this context butches and femmes were celebrated as a form of performance that exposed and subverted gender as a social construct. These ideas brought a greater range of participants into the butch/femme world. Contemporary emphasis on the fluidity of gender and sexuality means that a host of new concepts have joined “butch” and “femme” to aid individuals in more accurately voicing their identities. With all that is available, however, femme and butch remain centrally important ideas in understanding lesbian community.

BIBLIOGRAPHY

When the first gay and lesbian film festival was founded in San Francisco in 1977, few could predict that it would become the model for hundreds of festivals around the world (White 1999). Over the next four decades, LGBTQ+ film festivals grew from small, grassroots events to multimillion-dollar nonprofit organizations with ties to the commercial film and television industry. From London to Istanbul, Houston to Uganda, the international network of LGBTQ+ film festivals today makes up the single-largest institutionalization of queer cultural production.

Critical writing about the development of the LGBTQ+ festival network has primarily focused on issues of visibility and access to production, distribution, and exhibition. Debates about multiculturalism, corporate influence, funding structures, and cultural policy have occurred alongside discussions about programming strategies, globalization, community building, and political protest. This entry touches on many of these debates while sketching a brief history of the growth of the LGBTQ+ film festival network from its founding to the present day.

A Brief History of Film Festivals

LGBTQ+ film festivals must be understood in the context of film festivals more broadly, which began as a national showcase for film and propaganda in Fascist Italy before World War II (1939–1945). After the war, film festivals proliferated among resort towns in an effort to extend tourist seasons into the autumn months. They spread across Europe over the next thirty years as tourist attractions until the 1960s, when they began to spring up in global cities such as London, New York, and Berlin. Other cities, such as Moscow, established annual festivals in an effort to reconnect with the West after a period of isolation. (The Moscow festival got its start as early as 1935 but did not become a regular event until 1959.) Most often, these festivals programmed a combination of international art cinema and major studio releases, both of which took on increasingly politicized connotations in the wake of decolonization and at the beginning of a new wave of economic globalization (Stringer 2001).
The rise of the urban film festival accompanied the birth of community-based film festivals during the late 1960s and early 1970s, as well as the growth of museum film archives, all vying for screening venues. This trend corresponded not only to the mobilization of new social movements—the women’s movement, the civil rights movement, the gay and lesbian liberation movement, and others—but also to the development of portable video as an accessible and affordable medium. Film festivals offered a forum in which to share work among newly formed communities. The early 1970s also saw the rise of erotic film festivals in New York and San Francisco, which connected the message of sexual liberation with artistic innovation and European sensibility.

By the 1990s the schedule of the international festival circuit had become a fixture in the lives of most film industry executives. The New York Film Festival, Toronto, Cannes, Telluride, Sundance, Tribeca, and Berlin are today the places to launch Hollywood’s fall and winter lineup.

LGBTQ+ film festivals grew out of the gay liberation movement of the 1970s and other social justice movements. From the beginning, these community media practices were deeply invested in the discourse of democratic participation but at the same time were decidedly anticapitalist and in defiance of state-sanctioned homophobia. LGBTQ+ film festivals came out of a movement to deploy media in the building of social movements but would develop into a loosely structured global network of radically diverse organizations.

**Origins**

Most histories of LGBTQ+ film festivals trace their roots to a modest film series in London. In 1977 the English scholar Richard Dyer curated a survey of gay and lesbian film that screened at the National Film Theatre. It would be nearly a decade before a yearly festival would launch in London, but in San Francisco an ad-hoc screening that launched that same year would immediately become an annual event. Outfest was launched in Los Angeles just a few years later, in 1982. In 1984 the Ljubljana Gay and Lesbian Film Festival, the first in Europe, was founded in the midst of a small but growing gay and lesbian movement in Yugoslavia (Kajinic 2008). In 1986 London and Turin launched festivals, and Amsterdam hosted the International Gay and Lesbian Film Festival. (The latter would not become a yearly festival until 1996, as the Roze Filmdagen Amsterdam.)

In the beginning, festivals were informal events and primarily relied on earned-income activities such as ticket sales to cover their small operating budgets. But over the next decade, organized festivals would crop up in Manitoba, Copenhagen, New York City, Atlanta, Vancouver, Hong Kong, and Honolulu. These festivals were increasingly financed through arts subsidies and grants (for example, the British Film Institute sponsorship of the London festival), funds donated by foreign cultural ministries (most often linked to the screening of a particular film), and sponsorship by nongovernmental organizations (NGOs)
and philanthropic foundations. George Soros’s Open Society Institute, for example, granted funds to the Ljubljana event as part of a program to grant funds to arts organizations working in eastern Europe and Central Asia (Rhyne 2007).

Culture Wars

Festivals in the United States would not begin to access government funding until the late 1980s. As festivals grew in size and scope, their earned-income strategies could no longer support the organizations, especially as community resources were diverted to respond to the growing AIDS crisis. Simultaneously, government arts grants began to open up to gay and lesbian organizations; in a shift from its underground origins, festivals began to invest time and resources in accessing federal funding.

The festival network in the United States began to grow with the help of these federal and state arts grants, but in the late 1980s these granting agencies, such as the National Endowment for the Arts and the National Endowment for the Humanities, came under attack by the Far Right for supporting gay and lesbian artists and cultural organizations. Gay and lesbian film festivals were systematically cut off from federal funding. These “culture wars” were famously part of a larger national debate in the United States regarding the role of the federal government in facilitating artistic production. Festivals began to restructure their fund-raising strategies in order to find alternative funding sources. Many turned to the commercial sector and private funding.

Founded in 1988, the New Festival is a prime example of this shift. The New Festival arose from the ashes of the New York Gay and Lesbian Film Festival, which had collapsed as a result of funding concerns the previous year as ticket sales could no longer support the event. Susan Horowitz, the founder of a lesbian-owned printing company, provided financing to restructure the festival as a mission-driven business. According to Joshua Gamson, conveying Horowitz’s vision, “The original impetus of the festival ... was to join grassroots community politics and film art: to bring lesbians and gays together in another public space, to increase lesbian and gay visibility, to demonstrate the pluralism of that community, and to raise lesbian and gay consciousness” (1996, 242). Whereas Frameline (the San Francisco festival launched in 1977) began as a sort of artists’ collective and venue for experimental works, the New Festival—founded a decade later—was built on the politics of identity and visibility that had by then grown to characterize gay and lesbian organizational strategy in the United States (White 1999).

Soviet Stonewall

As the 1990s began, the festival network became more deeply connected to international networks of NGOs, particularly those investing in human rights and post–Cold War democracy building. In the wake of state censorship, festivals began to see themselves as
part of a global movement to connect LGBTQ+ people across national borders through a sort of grassroots cultural diplomacy. In 1991, for example, Frameline received funding to produce the first gay and lesbian film festival in the Soviet Union. Dubbed “the Soviet Stonewall” (named for the 1969 Stonewall riots in New York City that catalyzed a movement of gay rights activism), the festival was held in conjunction with a gay and lesbian rights conference organized by the San Francisco–based International Gay and Lesbian Human Rights Commission.

**FRAMELINE: THE WORLD’S FIRST LGBTQ FILM FESTIVAL**

On a February night in 1977, 200 people crowded into a San Francisco loft for what would become the first and longest-running LGBTQ film festival in the world. That night, nine gay filmmakers projected their Super-8 films onto a sheet hung from the wall. Cofounder Marc Huestis described the founding members of Frameline as “a ragtag band of hippie fags” and artists who frequented Harvey Milk’s Castro Street camera store (quoted in Guthmann 1994). The festival was conceived as an artists’ collective for independent and experimental gay filmmakers whose work had no other distribution outlet. To the surprise of its founders, the first screening of their films was such a success that it reran a month later at a larger venue.

In 1981 Frameline, the producing organization for the festival, founded a distribution arm through which video rentals raised the most significant portion of its revenue, a response to the limited availability of gay and lesbian film in the United States—particularly of gay and lesbian foreign film. Frameline distribution became a critical resource for new festivals that were emerging in cities such as Boston, Seattle, Philadelphia, and Washington, DC.

Frameline incorporated as a nonprofit in 1982 and received its first federal arts grant from the National Endowment for the Arts (NEA) in 1988. By 1990 Frameline’s primary income sources—generating nearly 70 percent of its revenue—were film and video rental, ticket sales, and special events. The remainder was raised from government grants, private foundations, and individual contributions. But with the introduction of the Helms Amendment in 1991, Frameline came under attack by conservative groups as being in violation of federal decency regulations for its gay and lesbian themes and sexual content. Frameline’s NEA funding was soon withdrawn. These famous “culture wars” meant the loss of dollars, but it energized the festival’s base. Attendance doubled at the 1992 festival compared to the previous year and would continue to grow over the next decade.

In 1990 Frameline deepened its connection to the filmmaking community, launching the Frameline Completion Fund, which continues to award grants for the final stages of editing work. Prominent LGBTQ filmmakers have received support through the
Frameline continued to receive support from a growing list of funders, including Barbara Hammer, Cheryl Dunye, and Rose Troche.

By 2005 Frameline had developed a sufficiently robust network of supporters that it launched a campaign to raise funds to expand its programming efforts and improve distribution access to global media markets. Its growth ambitions were stalled, however, with the 2008 financial crisis, which hit midsized nonprofits such as Frameline particularly hard in the United States.

Nonetheless, the festival produced by Frameline remains the largest of its kind in the world. In 2017 it screened 147 films from nineteen countries to more than 60,000 people, with total organizational revenue of around $2 million, dramatic growth forty years in the making.

*Ragan Rhyne*

*Independent scholar*

*Brooklyn, NY*

The films programmed at the 1991 Moscow festival included both mainstream American releases such as *Desert Hearts* (1985; directed by Donna Deitch) and independent documentaries such as *The Times of Harvey Milk* (1984; directed by Rob Epstein) and *Tongues Untied* (1989; directed by Marlon Riggs). It also included the British feature *My Beautiful Laundrette* (1985; directed by Stephen Frears), produced by Channel 4, and the East German film *Coming Out* (1989; directed by Heiner Carow). Following the Soviet Union’s political and cultural isolation from western Europe and North America, the programming of the Moscow festival presented a postwar, Euro-American gay history with resonance beyond national boundaries.

**New Queer Cinema**

Also in 1991, gay and lesbian films took center stage at mainstream film festivals, including Sundance, Toronto, and Berlin (Rich 1992). This commercial interest was as significant as the films themselves, including Todd Haynes’s *Poison* (1991), Jennie Livingston's *Paris Is
Burning (1990), Isaac Julien’s Young Soul Rebels (1991), and Derek Jarman’s Edward II (1991). Soon after, LGBTQ+ film festivals cropped up in the new global marketplaces of East Asia, eastern Europe, postapartheid South Africa, and South America. Festivals in the United States began to define themselves as the center of an international marketplace for gay and lesbian film, particularly as commercial distributors expanded their markets overseas.

By 1994 LGBTQ+ festivals had begun to be framed in dramatically new terms—not only as significant organizations within the growing network of the gay and lesbian community but also as part of a quasi-commercial complement to the film industry, where Hollywood and independent distributors were finding product, talent, and new markets. Frameline, for example, responded to this new industrial interest with an assertive plan to host the “world’s first lesbian and gay film market.” Frameline’s marketplace was most certainly developed with the explicit intent to elaborate on the festival’s already robust distribution program, which had generated the bulk of the organization’s revenue until the early 1990s, but following the death of the festival’s art director, the organization suspended the effort.

Festivals located a new source of funding in the form of corporate sponsors and commercial film distributors interested in marketing to the newly defined gay and lesbian consumer demographic. But almost immediately, festivalgoers, scholars, filmmakers, and activists began to identify this moment as one characterized by the intrusion of corporate interest into community institutions. Corporate sponsors were highly visible through festival marketing and promotions, but in reality they provided only a small portion of the festivals’ growing budgets. Festival growth was instead subsidized by a newly cultivated sense of philanthropic responsibility among individual donors that accompanied the articulation of a gay and lesbian consumer identity during the early 1990s.

In North America the growing skepticism regarding the ability of community-based festivals to remain independent from the market and the state particularly coalesced around questions of multiculturalism. Filmmakers, especially, questioned the terms on which women and people of color would have access to the new economic opportunities presented by the festivals, particularly as higher-budget, narrative features by white gay men received increasing attention from the commercial film industry. These debates colored much of the critical discussion around LGBTQ+ festivals following the debut of New Queer Cinema and inspired a wave of festivals devoted to underrepresented groups within the community.

**BFI FLARE: LONDON'S FIRST LGBTQ FILM FESTIVAL**

In the summer of 1977, the English scholar Richard Dyer screened thirty-five gay films at the National Film Theatre, a cinema operated by the British Film Institute (BFI) and located in the London cultural district known as South Bank. Although this was a one-
off event, it is widely considered the world's first gay and lesbian film program and the origin of gay and lesbian film festivals. Certainly, it launched the London Lesbian and Gay Film Festival, one of the largest and longest-running LGBTQ+ festivals in the world.

It would be another nine years, however, before the festival was officially launched. In 1986, a former student of Dyer's, Mark Finch, persuaded the BFI to fund a gay film series. Finch and Tyneside Cinema’s Peter Packer launched a selection of nine films in a program called “Gay's Own Pictures” at the Tyneside in Newcastle before bringing it to London. Films screened over the seven-day short season included *Parting Glances* (1986; directed by Bill Sherwood), *Desert Hearts* (1985; directed by Donna Deitch), and *Buddies* (1985; directed by Arthur J. Bressan Jr.).

The festival debuted during the height of the AIDS crisis, which had hit gay communities in urban centers such as London particularly hard. It also coincided with a national movement to squelch public support for gays and lesbians. Beginning in London, it traveled to major cities across the United Kingdom in defiance of the Margaret Thatcher–era Section 28, enacted in 1988, which prohibited local authorities from “intentionally promoting homosexuality.” While members of Parliament questioned the government’s role in supporting these screenings, the London Lesbian and Gay Film Festival (as it became officially known in 1988) would nonetheless become an annual event sponsored by the BFI (and thus through tax money). Section 28 would remain on the books until 2003.

The festival grew from a seven-day event to a full two weeks of programming, drawing audiences from all over the United Kingdom, other European countries, and the world. In 2011, as the festival prepared to celebrate its twenty-fifth anniversary (and with the Conservative Party back in government), the BFI suffered broad budget cuts, and the festival was cut down to half its previous length. These austerity measures proved a boon for the festival, however, as the scarcity of tickets brought audiences out in new force. By 2016, five years later, the festival had expanded to an eleven-day program at BFI Southbank (the renamed National Film Theatre, where Dyer presented his original series), with larger audiences than ever before.

The festival’s programming has expanded beyond the festival itself, with monthly screenings, talks and lectures, a traveling program, and a streaming service through BFI Player. The BFI generally streams free shorts around the festival dates. The festival also established an ongoing relationship with the UK distributor Peccadillo Pictures. Peccadillo is one of the sponsors of the festival and regularly includes titles in its program. The festival’s relationship with Peccadillo illustrates the role of the London festival—and that of LGBTQ+ festivals around the world—in the circulation of LGBTQ+ film. Festivals are primary markets for independent filmmakers and producers to find
distribution in the commercial marketplace.

In 2014 the festival was officially rebranded as BFI Flare: London LGBT Film Festival in an effort to reflect the diversity of the festival’s program and its audiences, which continue to grow. In addition to support through the BFI, Flare has received corporate sponsorship over the years—support that has strengthened with changing attitudes toward LGBTQ+ people.

Corporations such as longtime sponsor Renault, American Airlines, easyJet, Accenture, London’s May Fair Hotel, and Sky, the London-based media and telecommunications company, have sponsored festivals. Indeed, attendance at the 2016 festival exceeded 25,000 people, up nearly 10 percent from the previous record-breaking year, so it remains an effective tool for corporations to reach this niche market. In 2018 the Pureland Foundation, founded by the producer and philanthropist Bruno Wang, made a three-year grant to the festival, becoming its most significant supporter. Like BFI Flare, LGBTQ+ film festivals around the world have begun to depend more heavily on private philanthropy, particularly in the wake of the 2008 global recession.

*Ragan Rhyne*

Independent scholar  
*Brooklyn, NY*

Tranny Fest (now the San Francisco Transgender Film Festival) was launched in 1997 to present the work of gender-variant filmmakers—the first and longest-running festival of its kind. Since then, a dozen trans and gender-variant festivals and film programs have been hosted around the world, including in India, the Netherlands, Australia, and Canada, as well as the biggest trans film festival, Translations (held in Seattle and programmed by the same organization that stages TWIST: Seattle Queer Film Festival). These festivals continue to struggle for funding, particularly in markets with more broadly framed LGBTQ+ festivals. The transgender festival in Amsterdam, for instance, has gone through several iterations since its launch in 2003, primarily because of funding concerns ([Steinbock 2013](#)).
Second Wave

More than 150 LGBTQ+ festivals could be counted at the end of the 1990s, and critics were declaring the next Gay New Wave as an international phenomenon. Festivals were programming content from the breadth of production prompted by the New Queer Cinema movement and a subsequent increase in financing for gay and lesbian film outside the United States, particularly in western Europe but also in Australia, Hong Kong, Taiwan, Brazil, the former Soviet republics, Japan, and Israel, as well as to a lesser extent Africa and elsewhere in the Middle East.

Indeed, this second wave of queer cinema produced a number of internationally recognized films, especially from gay filmmakers located outside Europe and North America, but US-produced films still overwhelmingly dominated the screens at most festivals. The proliferation of LGBTQ+ film festivals did not necessarily correspond to new production infrastructures during the 1990s, despite the growth in the network precipitated by a growing market for LGBTQ+ film.

Corporate and Government Funding

By the first years of the twenty-first century, production of gay and lesbian film in the United States had stalled, and the growth of festivals along with it. Indeed, of the hundred or so festivals that were founded in the 1990s, most did not last more than two or three seasons. Those that did survive during this period found financial support primarily through government subsidies and corporate investment, but access to these funds varied dramatically by country.

The São Paulo–based Mix Brasil, launched in 1993, grew out of André Fischer’s 1992 program “Brazilian Sexualities” at the New York Lesbian and Gay Experimental Film Festival. Mix Brasil, launched as a project of the Cinema Department of the Museu da Imagem e do Som (Museum of Image and Sound), received most of its funding from the public sector, a large portion of which was from health departments. But the festival also attracted commercial sponsors, including Banco do Brasil and the oil company Petrobras, which was a large funder of the Brazilian film industry and the country’s festival network; government initiatives focused on gays and lesbians encouraged corporate investment, but this was unevenly spread across the network (Rhyne 2007).

The Hong Kong Lesbian and Gay Film Festival was launched in 1989 and ran intermittently until 1998, when the festival lost its funding during a recession and government defunding of cultural programs with the handover of Hong Kong to China the previous year. It was resurrected in 1999 as a commercial enterprise connected to Fortissimo Films, a film promotion, distribution, and production company known for its relationship to high-profile Asian directors. The festival leveraged these connections to secure donations from local
businesses and other pools of government and NGO monies, notably those connected to HIV/AIDS prevention. The festival incorporated as a nonprofit in 2000 (Rhyne 2011).

Other festivals found support in the growing sector of gay and lesbian tourism and travel, which was reflected in the programming of festivals. The Manchester gay and lesbian film festival, a program of the queerupnorth arts festival (formerly It’s Queer Up North), for example, was supported by the now-defunct British Midland Airways. Manchester’s international exposure as the setting for the Channel 4 television series Queer as Folk (1999–2000) certainly contributed to its growing popularity among tourists, and sponsors hoped to capitalize on this new tourist demographic. The positioning of the United Kingdom as an international gay destination was marketed in the United States as well. The 2003 New Festival (New York) was sponsored, in part, by VisitBritain, a UK tourist board.

**Home Distribution**

By the turn of the millennium, the distribution companies that had seen mainstream commercial opportunity in queer film had turned their attention elsewhere, and they were overtaken by gay- and lesbian-owned production and distribution companies developing content on a smaller scale (Straayer and Waugh 2005). Cable, digital, premium, and pay-per-view television became significant buyers for gay and lesbian media, surpassing theatrical release as the primary exhibition venue for LGBTQ+ film. These outlets also became key sponsors of festivals, investing in cause-related marketing initiatives to publicize their gay and lesbian programming. HBO and Showtime, in particular, “branded” festivals, using organizations such as the New Festival and Outfest to premiere films and television dramas already picked up for rotation.

In 2006, in conjunction with its thirtieth annual festival, Frameline introduced its home video line, in partnership with Strand Releasing. The festival framed the initiative in terms of its transition from the education and festival markets that had sustained it over the previous two decades to the direct-to-consumer market. Frameline’s home video marketing positioned the brand as a mediator of taste—a trusted guide for authentic LGBTQ+ media for the consumer market. While the nonprofit structure of the festival-as-event has previously been held up as the most effective strategy for ensuring this kind of diversity of programming, Frameline began to look directly toward the consumer market to fulfill its mission.

**Financial Crisis**

Following the 2008 global recession, LGBTQ+ festivals lost significant revenue along with much of the nonprofit sector around the world. Many small festivals closed entirely; others were forced to reorganize their structures and fundraising strategies as they struggled to recover amid a rapidly changing media landscape and changing political status in many
countries. In the United States, for example, New York’s New Festival merged with Los Angeles’s Outfest; San Francisco’s Frameline laid off significant numbers of its staff as its budget shrank by nearly 30 percent over the next several years. South Africa’s Out in Africa festival closed in 2015 after twenty-one years of programming because of fund-raising challenges.

But festivals are exploring new revenue sources, new distribution strategies, new networks, and new technologies. The strategy launched as early as 2002 with Here TV, a pay-per-view service. Viacom launched Logo, a cable channel, in 2005. Both drew on the content and format of LGBTQ+ film festivals. Since then, the ubiquity of streaming video services, in particular, is changing the landscape, programming strategies, and institutional priorities of LGBTQ+ film festivals. In 2018, for example, Amazon announced that it would offer more than sixty films featured in Outfest festivals, a strategy Amazon has employed with other festivals, including Frameline, Sundance, Tribeca, and Toronto. BFI Flare, the London LGBTQ+ film festival run by the British Film Institute (BFI), offers its titles on its own streaming service, BFI Player. The wide availability of LGBTQ+ independent film through streaming services such as YouTube, Vimeo, and Viddsee (in Southeast Asia) may in fact be creating new markets for theatrical screenings; the POUTFest in the United Kingdom, for example, is a traveling festival launched by the distributor Peccadillo Pictures and funded through the BFI to develop new audiences for LGBTQ+ film. Indeed, developing new audiences through educational outreach has also become an important part of the mission of several festivals and distributors. Frameline’s Youth in Motion program, for example, provides free LGBTQ+ films and curricula to youth and educators in schools around the United States. Vancouver’s Out on Screen launched an education program in 2004 that serves 60,000 students in British Columbia.

In conclusion, LGBTQ+ film festivals are particularly productive sites for inquiry because they have been one of the primary spaces for the public exhibition of queer images since the late 1970s and further because their relationship to the global circulation of film makes them uniquely situated at the intersection of the market, the state, and civil society. Moreover, as exhibitors (and, in some cases, distributors) of media, LGBTQ+ film festivals have been particularly enmeshed with debates about visibility politics, multiculturalism, and globalization in the international queer community (Loist 2016).

LGBTQ+ film festivals also reveal a great deal about how queer people understand their own relationship to the state and the economy in various national contexts. The history of development, expansion, collapse, and stabilization of festivals demonstrates how crucial material concerns are to the formation of LGBTQ+ collectivities and how organizational sustainability informs the scope of possibility for effective political strategy. LGBTQ+ film festivals offer an ideal case study through which to examine how structures of governance—nonprofit administration, state censorship, cultural policy, and commercial marketing strategies, to name a few—have influenced the size, shape, and scope of what is now a
global institution.

**FILMOGRAPHY**

Julien, Isaac, dir. *Young Soul Rebels.* British Film Institute, 1991. Film.

In Latin America, the decades between 1880 and 1920 represent a period of dramatic demographic, cultural, and political change. It was during this time that technological advances along with increased investment in infrastructure and communication led many nations to enjoy unprecedented economic growth. But this growth was often uneven, benefiting the traditional landed elite and entrenching divisions between the rich and the poor. Issues such as the (over)exploitation of natural resources, poor working conditions, and rapid urbanization affected vast swaths of the population. At the same time, the growing middle class sought greater political representation in countries such as Argentina, Chile, and Brazil, while indigenous movements in Peru, Bolivia, and Mexico sought to gain a voice in national affairs. Socialist organizations were formed to advocate for better working conditions for disenfranchised populations, while anarchist groups sought to completely restructure social and economic relations. The Spanish-American War (1898) marked a paradigm shift in regional power dynamics, with the United States exerting ever-greater influence. The Mexican Revolution (1910–1920) sought a redistribution of land for peasants and indigenous communities. In this context, the notion of “progress” for Latin American nations became central to cultural, political, and economic policies. This ideology of progress was buoyed by a shift toward positivist science and increased interest in managing diverse and growing populations.

The study of sexuality in the fin de siècle period should be understood in relation to the aspiration, held by most Latin American nations, to control population growth. Leading politicians argued that for nations to modernize they had to know the precise makeup of their populations in addition to their sexual habits. Across Latin America, but particularly in countries with large immigrant communities such as Brazil, Argentina, and Chile, demographic control was aimed at “whitening” the national population. Intellectual leaders often conflated the behaviors that were attributed to white European immigrants, such as industry, work ethic, and morality, with whiteness itself. Latin American nations sponsored new methods of scientific inquiry, such as demography, social psychology, criminology, and public hygiene (known as hygienics), not only to promote a whiter and thus more “modern”
populace but also to discover and potentially cure what was called at the time “sexual perversion.” Any form of sexuality (such as homosexuality) or gender variance (such as transvestism) that was thought to detract from the overarching goal of promoting the national cause was seen as pathological and dangerous, and nations sought to reform these “deviant” practices in the name of progress. While the influence and application of scientific approaches (known as positivism) to sexual difference was ubiquitous across cultural and political lines, not all spheres of society engaged with this difference in the same way. The following sections describe major conceptual debates in fin de siècle Latin America around the role that sexuality should play in science, politics, literature, art, and culture.

**Positivism and Sexuality**

At its core, positivism can be understood as a set of beliefs meant to promote a country’s social, political, and economic advancement by privileging the scientific method. As a philosophy, positivism discounts as unknowable anything that an individual is unable to observe in the natural world. Scientific principles were applied to politics and economics, as well as to social relations and art, all of which had profound implications for the politics of gender and sexuality. In Latin America, intellectuals such as Justo Sierra (Mexico), José María Samper (Colombia), and José Ingenieros (Argentina) adapted ideas from the prominent European philosophers Auguste Comte, Gustave Le Bon, and Herbert Spencer to develop models of education and public policy that privileged scientific observation over metaphysics or religious doctrine. In particular, the concept of social evolution came to bear on how these intellectuals sought to promote the development of Latin American nations.

Variations existed across Latin America, but as a whole, these new theories of scientific inquiry allowed the intellectual elite to justify attempts to retain control of land, politics, and economics, as well as to promote a heterosexual citizenry. Positivism became a way to determine which types of sexual practices would promote progress and which would lead to “degeneracy.” The fear of social and ethnic regression—degeneracy—was inspired by the work of the Italian criminologist Cesare Lombroso and focused on populations that did not fit the normative model of social and sexual identity. In this way, homosexuality, cross-dressing, and gender variance all became crucial objects of study for social pathologists and criminologists. Detailed case studies, reform programs, and invasive therapeutic techniques became commonplace across Latin America during this period. Given the interest of national leaders in managing local populations, positivist science came to represent the central tool in identifying those who might diverge from the heterosexual norm.

**Case Study: Argentina**

In Argentina at the turn of the century the central concern of government officials was how
to incorporate into a cohesive national culture the massive influx of largely European immigrants that arrived during this period. Rapid economic expansion, based particularly on bovine and grain exports, had turned Argentina into one of the wealthiest countries in the region. Leading politicians such as Domingo Faustino Sarmiento and Juan Bautista Alberdi argued that immigrants were needed to populate land expropriated from indigenous communities and to provide labor for developing industrial economies. By 1914, 30 percent of the national population was foreign born, most coming from Italy and Spain. The capital, Buenos Aires, became a cosmopolitan city with a burgeoning middle class. Despite this economic growth, however, social tensions persisted between recent immigrants and those of generations past.

In both the social sciences and literature this tension was consistently attributed to recent immigrants and their supposed unwillingness to adapt to the Argentine culture. Sexual deviance was one of the principal characteristics attributed to many of these immigrants, and criminologists, social pathologists, writers, and politicians sought to construct a detailed taxonomy of the various forms of sexuality that might prove detrimental to the future of the country. Politicians feared the inversion of gender roles, as well as the possibility that the existing class structure, which concentrated power and wealth in the hands of a small group of traditional landholding families, would be upended. Key social scientists of this period include the physician José María Ramos Mejía (1849–1914), the forensic psychiatrist Francisco de Veyga (1866–1948), the psychiatrist José Ingenieros (1877–1925), and the sociologist Carlos Octavio Bunge (1875–1918), whose work focused on explaining supposedly abnormal behavior—both sexual and cultural—so that it might be purged from the national body. This preoccupation with cultural assimilation and sexual deviance led to the invention and scrutiny of figures such as the invertido (sexual invert), uranista (homosexual), pederasta (pederast), tribadista (tribadist; what today would be called a lesbian), and tercer sexo (third sex). It is important to note that in Argentina in the first decade of the twentieth century neither cross-dressing nor homosexual erotic practices were prohibited by civil or criminal codes. However, physicians and psychiatrists would often appeal to police in an effort to "prevent" public scandal or a crime yet to be committed by sexual “deviants,” who would be arrested preemptively and turned over to positivist scientists for examination. The resulting case studies were published in prestigious journals such as Archivos de psiquiatría, criminología y ciencias afines (Archives of psychiatry, criminology, and like sciences) and Revista argentina de ciencias políticas (Argentine journal of political science) and were often sponsored by the Argentine government, giving criminologists of the period a significant role in the process of shaping and reforming the national population.

In the case of men, these studies did not necessarily stigmatize homoerotic practices per se, but rather the particular role in sexual activity that was adopted by an individual. The distinction between “active” (insertive) and “passive” (receptive) sexual activity in men was crucial. Thus, in Argentina what most worried social scientists was the betrayal of the
stereotypical role of men as active partners in sexual relations. The adoption of the passive role, called “sexual inversion,” particularly when accompanied by a shift in gender presentation or cross-dressing, was especially vexing for the Argentine elite. For example, de Veyga’s 1903 study of Aurora, a transvestite and “professional invert” (prostitute), describes the subject as having a long criminal history, and notes that in fact “it is frequent, or better yet the rule, that a professional invert be a criminal in the same way as ‘Aurora’” (199; translated by Joseph M. Pierce). This sexual abnormality, for de Veyga, was the product of mental weakness and economic need rather than genetics. Aurora’s “inversion” was attributed to an insalubrious lifestyle, a lack of intellectual development, and a tendency toward criminality.

In the case of women, physicians and criminologists used the term third sex as a sexual category to refer to those who entered the labor force and became economically independent from men. The early feminist movement in the region had to negotiate long-standing political and social opposition to women’s freedom and rights, and only in the early years of the twentieth century did questions of gender relations and women’s rights come to the fore. On the one hand, socialist politics found room in its platform to advocate for labor reforms and the juridical emancipation of women. On the other, middle- and upper-class women invested in the feminist cause often relied on conservative appeals to maternity and liberal notions of civic equality under the law. The development of Argentina’s education system—in particular the escuelas normales (normal schools) that trained young teachers (they are usually called teachers colleges in English)—led to more opportunities for women. However, these educational centers were often regarded as dangerous for their potential to incite women to homosexuality. Enclosed spaces such as the convent and the normal school—spaces in which women exercised a modicum of independence from men—became suspicious in the eyes of social pathologists, whose interest in maintaining traditional gender roles led them to criticize early feminism and to associate outspoken women with anarchism and social decay.

In Argentina, the central question for social scientists was whether sexual deviance was congenital (innate) or acquired (environmental). Most tended to blame circumstance or economic need. (As noted above, some inverters were described as “professional,” supporting themselves through prostitution.) Physicians and psychiatrists thought that early detection and strong (i.e., traditional) educational programs could prevent or reverse acquired sexual deviance. This approach contrasted with that taken toward congenital homosexuality, which, following European sexology, was seen as incurable. In this way, criminologists and social pathologists worked in tandem with national educators to identify what they deemed to be the dangerous but preventable social phenomenon of acquired homosexuality. Ramos Mejía, de Veyga, and Ingenieros championed the cause of reform in both men and women, which they consistently attributed to the influence of foreign ideas and people (immigrants). In his 1899 study Las multitudes argentinas (The Argentine multitudes), for example, Ramos Mejía described recent immigrants (guarangos [the uncouth]) as
biologically underdeveloped, adding that they “are like the inverts of sexual instinct who reveal their dubious potential for the bilious manifestation of appetites” ([1899] 1977, 214; translated by Joseph M. Pierce). Thus, positivist discourse in Argentina linked foreignness to the potential for both sexual and cultural inversion, and social scientists sought to incarcerate and reeducate those deemed to have acquired “deviant” behaviors.

**Case Study: Mexico**

The issue of homosexuality came to the fore in Mexico in November 1901 when forty-one men were surprised and arrested by the police at a private home where they were holding a drag ball. Some were dressed as women, wearing elegant gowns, wigs, and makeup, whereas others wore typically masculine suits. They were tried quickly and sentenced to work with the military on the Yucatan Peninsula in order to be “rehabilitated.” This scandalous episode came to be known as El Baile de los 41 (The Dance of the 41). Newspaper reports of the incident ranged from discreet to sensationalist, and the famed artist José Guadalupe Posada (1852–1913) produced a series of etchings depicting the event and its aftermath.

**INVERTIDO AND FEDERASTA**

In Latin America during the fin de siècle period, two key figures emerged as objects of scientific study for criminologists and social psychologists: the *pederasta* (pederast) and the *invertido* (invert). Replacing earlier terms such as *sodomita* (sodomite) or *uranista* (uranian), which were adapted from European sexology, *pederasta* and *invertido* preceded the contemporary use of “homosexual” and were deployed in similar though not identical ways. While scientists distinguished between active (insertive) and passive (receptive) pederasty, they did not always connect these sexual acts to a particular gender identity. *Invertido*, in contrast, referred to what scientists saw as a form of sexual and mental inversion that typically involved a cross-dressed (male-to-female) subject, often associated with prostitution. Criminologists stigmatized both as morally corrupt, but the *invertido* was seen as particularly dangerous because he feminized—that is, inverted—his physical appearance, dress, and mode of speech, thus transgressing his biological sex in the eyes of the scientific community. The central question that scientists asked was whether these subjects were products of the surrounding environment or the result of some “corrupt” genetic trait.

For example, the Cuban physician and anthropologist Luis Montané (1849–1936) published a study in *El progreso médico* in 1890 analyzing the mental and physical characteristics of twenty-one *pederastas* who had been arrested by the Cuban police. He first made a distinction between “aficionados”—that is, those who sought sexual satisfaction with men and paid for that service—and “prostituidos” (prostituted),
which were those who made a living by selling their bodies as pederastas. Montané describes the mental state of the prostituidos as nervous and narcissistic and cites the French medical doctor and forensic scientist Auguste Ambroise Tardieu (1818–1879) to characterize their appearance as “strange, repugnant, and suspicious” (62; translated by Joseph M. Pierce). The Cuban differentiated between active and passive pederasty, concluding that there is no definitive correlation between passive sexual activity and an outwardly feminine gender presentation. However, following the work of the European sexologists Armand Goubaux, François Carlier, and M. Henri Marx, he did find that passive pederasts can be identified by examining the dilation and shape of the anus, something he calls of great value for the scientific community. For active pederasts, Montané examined the volume and appearance of the penis, finding no clearly identifiable marker in those subjects. Thus, the search for scientific certainty regarding sexual deviance often involved invasive examinations that yielded unsatisfying and ambiguous results.

Another example was published by the Argentine physician Francisco de Veyga (1866–1948) in 1903 in Archivos de psiquiatría, criminología y ciencias afines (Archives of psychiatry, criminology, and like sciences). He describes a case of inversión sexual adquirida (acquired sexual inversion) in which, according to de Veyga, a wealthy Argentine man suffered a mental breakdown and because of this is shunned by his friends and family. He spent his days in local brothels where eventually, according to de Veyga, a marica (faggot), defined by the physician as a paranoid invert, invited him to a party (207). There he found the attention that he had been lacking at home among the attending invertidos, and he eventually decided that he would like to become one. He abandoned his previous family and began a new life with a man who fell in love with him as an invertido. Even more alarming for de Veyga, however, this subject did not shy away from society but rather, as he notes, “flaunted his life, becoming a notable figure in his/her special milieu” (de Veyga 1903, 207; translated by Joseph M. Pierce). On the one hand, for de Veyga this case study represents the possibility that sexual inversion may remain dormant as a genetic disposition and become activated after a psychic or social trauma. On the other, it recalls certain tropes that would continue to be associated with homosexuality over the course of the twentieth century and into the twenty-first, such as uncleanness, a desire for ostentation, gender nonconformity, and deceptiveness. For the Latin American elite, this type of sexual practice represented a pathological threat to reproductive sexuality, one that should be closely monitored and, if possible, cured.

**BIBLIOGRAPHY**

de Veyga, Francisco. “La inversión sexual adquirida: Tipo de invertido profesional. Tipo de invertido por sugestión. Tipo de invertido por causa de decaimiento mental” [Acquired sexual inversion: The professional invert type. The invert by suggestion
The case of the 41 should be understood within the particular context of Mexico’s political regime at the turn of the century. Known as El Porfiriato, the reign of Porfirio Díaz as president (from 1876 to 1911) was characterized by strong-arm policies, election fraud, and the repression of dissent, but also national investment in modernizing the country under the auspices of scientific investigation. “Order and Progress” became the motto of a regime that saw sexual deviance as not simply a hindrance to modernization but rather the cancerous product of lax cultural attitudes toward pleasure and intimacy. Again, cross-dressing was particularly stigmatized, a practice that challenged social and cultural norms, as well as conservative ideas of sexuality. In this context, the homosexual as transvestite or effeminate man (maricón) again serves as a cultural marker for the breakdown of order and the potential for social regression.

In contrast with the Argentine case, however, El Baile de los 41 as a cultural phenomenon was not necessarily attributed to outside influences or immigration but rather to what was seen as the moral decay of Mexican society from within. In particular, Posada’s art associates transvestism with the emasculated fashion sense of upper-class (ostensibly heterosexual) men, known as lagartijos (literally, “lizards”; figuratively, “fops”). The scandal disrupted not only social conventions based on heterosexual norms but also divisions of class, age, and gender. Instead of the schematic rendering of sexuality by Argentine social scientists, at least in Mexico’s popular newspapers, the event was seen through the lens of sexual libertinage. Upper-class men of El Porfiriato were criticized as affected and overly influenced by the artifice of modernity.

This contrast can also be seen by comparing the novel Los cuarenta y uno: Novela crítico-social (1906; The forty-one: A socio-critical novel), signed with the pseudonym Eduardo A. Castrejón, which leans on the carnivalesque tradition in Mexico to explain cross-dressing, to Argentine José González Castillo’s (1885–1937) play Los invertidos (1914; The inverted/faggots), which portrayed foreign influences such as socialism, anarchism, and
homosexual activism as a collective disease that was corrupting Argentine youth. In Mexico, the fear of sexual excess was eloquently described in Castrejón's novel, which locates the decline of society in the figure of the homosexual: "And into that insatiable vortex of brutal pleasures they have fallen, never to get up. The fallen young men, at the height of stupidity and prostituted degradation, contribute to the bastardization of the human race, committing grave harm against Nature" (quoted and translated in Sifuentes-Jáuregui 2002, 46). Evidently, positivist discourse was not limited to the sciences; it also found expression in literature and art, as with Posada's drawings and Castrejón's Los cuarenta y uno. In many cases, literary re-creations of scandalous events, disruptive figures, or pressing social problems provided a more engaging platform for public consumption. The following section turns to the literature of the turn of the century in order to expand on its role in defining sexual identities and practices in Latin America.

In Literature: **Naturalismo and Modernismo**

Two major literary currents dominated fin de siècle Latin America: naturalismo (naturalism) and modernismo (modernism). Naturalismo relied on the realistic depiction of social ills, a treatment that privileged scientific terminology and a tendency to pathologize characters deemed to be racially, culturally, or sexually abhorrent. Inspired by the French author Émile Zola, naturalist writers such as Julián Martel, Eugenio Cambaceres, and Manuel Podestá (all from Argentina), Aluísio de Azevedo and Joaquim Maria Machado de Assis (both from Brazil), Clorinda Matto de Turner (Argentina/Peru), Alcides Arguedas (Bolivia), and Federico Gamboa (Mexico) took aim at Latin America's history of racial mixing and supposed cultural backwardness vis-à-vis Europe and the United States. Their work often took the form of a diagnostic appraisal of a nation's history and contemporary social problems. In particular, emasculated male characters came to represent the failure of a country to maintain order in this contradictory period. Of note in this regard is a novel from Brazil, Adolfo Ferreira Caminha's (1867–1897) Bom-Crioulo (1895; *Bom-Crioulo: The Black Man and the Cabin Boy* [1982]). *Bom-Crioulo* describes a homosexual relationship between an escaped black slave (slavery was abolished in Brazil in 1888) working as a sailor in the Brazilian navy who falls in love with a young cabin boy, Aleixo. The novel is remarkable for its ambiguous treatment of this relationship, eschewing the moralizing view taken by most naturalist writers. Same-sex desire is the primary engine of this novel, which is structured as a classical tragedy, with Bom-Crioulo killing Aleixo in a fit of jealousy at the end. Typically, however, sexually ambiguous or deviant characters in this period suffer tormented lives and deaths, as in Cuban José Martí’s 1885 novel *Lucía Jerez* (also known as *Amistad funesta* [Fatal friendship]) and Chilean Augusto d’Halmar’s 1924 novel *La pasión y muerte del Cura Deusto* (The passion and death of Father Deusto). If in psychiatry the homosexual had to be “cured” through education and therapy, in literature he or she almost always meets a violent end.
Modernismo, in contrast, was a philosophical and aesthetic movement based on strangeness (rareza), formal renovation, preciousness of style, and escapist imagery. Modernismo was perhaps the most important literary movement to come from Latin America, and modernistas such as José Martí (1853–1895; Cuba), Rubén Darío (1867–1916; Nicaragua), and José Enrique Rodó (1871–1917; Uruguay) revolutionized the way sensuality was understood in the region. On the one hand, these writers were inspired by French decadentistas (the decadent movement), who posited the body as a site of pleasure and perversion, and on the other, such an open transgression of decorum was met with skepticism in Latin America. For example, Darío’s Los raros (The strange/queer ones), published in 1896, is a series of personality sketches, primarily of French symbolists, that at once celebrates their aesthetic sensibilities and reproduces homophobic discourses around sensuality and eroticism. Latin American modernismo looked to figures such as Walt Whitman, Paul Verlaine, and Oscar Wilde in a complex framework of admiration and reticence. While never identified specifically as homosexual, the strangeness of these raros served to highlight Darío’s modernity. Still, their sexual ambiguity and the sensuality of their work was grounds for censure by Latin American critics.

The most prominent example of this contradictory position is Rodó’s 1900 essay Ariel, which attempts to provide a corrective to what the author believed to be the overly sensual poetics of modernismo at the turn of the century. Rodó proposes a spiritual and anti-utilitarian reformation of Latin American aesthetics, one more in keeping with a conservative vein of intellectualism in the region. Nevertheless, homoeroticism and corporeal sensuality would resurface in Latin American letters, such as in the work of Julián del Casal (Cuba), José Asunción Silva (Colombia), Delmira Agustini (Uruguay), and Salvador Novo (Mexico), as aesthetic trends moved toward the avant-garde after World War I (1914–1918).

As noted earlier in the case of the lagartijo, these aesthetics were also applied to the bodies, dress, and attitudes of those producers of literary texts. As with the lagartijo, the figure of the dandy came to represent the modernization and cultural acumen of bourgeois men (but also some women), as well as the potential excesses of artifice. The adornment of men’s bodies, their preoccupation with style, and the unpredictable nature of their speech and gestures led to contradictory understandings of gender as performative, as a pose. The dandy was a nonconformist—a provocateur—interested in beauty, elegance, and eccentricity in a period marked by the gradual decline of the elite and the relative homogenization of culture. Thus, for artists interested in standing out in the ever-growing and always mistrusted crowd, dandyism represented a shift toward individual style and ostentation. This shift was controversial in many of the same ways as modernismo: by pushing the limits of aesthetic propriety, both forms of representation were revising the way gender and sexuality were understood as relative and relational rather than as biologically determined.
Across Latin America in the fin de siècle period, the rapid pace of modernization led to massive shifts in demographics, politics, and modes of life. Social anxiety—especially on the part of Latin American elites—over the future of Latin American nations found expression in the scientific community, which used positivism to justify the examination of sexual pathologies in an effort to explain the supposed decadence of groups such as immigrants, the working class, homosexuals, and transvestites. Social scientists adapted European models to local populations and attempted to “correct” deviant identities and practices in the name of order and progress. However, a close examination of the period reveals how the interrelated spheres of science, art, and culture did not universally reject sexual difference and gender variance. Instead, for members of the elite, the contradictions of modernity reflected a simultaneous fascination with individual expression, fear of cultural decadence, and disdain for populist rhetoric. The supposed objectivity of positivist science allowed upper-class politicians to attempt to control the future of Latin American populations. Yet in looking to Europe for inspiration, many of those same politicians (writers and artists) became enamored with stylistic innovations that were seen by critics as overly sensual or even queer (*raro*). Modernity implied simultaneously seeking to promote a specific cultural identity and adapting to new and at times revolutionary ideas. In literature and art as in science and politics, the Latin American fin de siècle staged the negotiation of contradictory ideologies, people, and desires. This complicated period underscores the paradox of control and repression, liberalism and the expansion of individual freedoms—issues that continue to inform Latin American politics to this day.

Fire (1996; Deepa Mehta)

GEETA PATEL
Associate Professor, Middle Eastern and South Asian Languages and Cultures and Women, Gender, and Sexuality
University of Virginia, Charlottesville

The first mainstream film in India to portray homosexual love.

The film Fire, written and directed by the Indo-Canadian filmmaker Deepa Mehta (1950–), was first released in Canada in 1996 and opened in India at the International Film Festival of Kerala in 1997. Its mainstream distribution in India in 1998, its circulation, and the ensuing turmoil are by all accounts a watershed for queer representation in India; they portended a seismic shift in the ways in which both queer movements were orchestrated and queer visualities were shaped. The effects of the film’s release were widespread and cannot be easily folded into a linear narrative of opposition or visibility. Instead, the film and its ensuing responses provide tools to theorize about changes in the landscape of queer rights in India.

Loosely based on the Urdu short story “Lihaf” (The quilt), by the communist Muslim writer Ismat Chughtai (1911–1991), who was charged with obscenity in the early 1940s, Fire is centered on the growing desire between two married women who eventually fall in love, have sex in one of their marital beds, and effectively abandon their family household. What is striking about the film, and particularly a South Asian film, is its setting: a “joint-family” household, in which each woman is married to a brother. This household, which was composed of the two women, Sita and Radha (the names referencing mythic characters); their husbands, Jatin and Ashok; their mother-in-law; and the man-of-all-work Mundu, is located in a lower-middle-class neighborhood in New Delhi, and both women labor in the thriving family business selling videos (both over and under the table, so to speak) and snack-style delicacies. The two men have other so-called pastimes that sidetrack them from healthy relationships with their wives: Ashok has a guru who recommends curbing his sexual proclivities with his wife, while Jatin is irrevocably entangled with a young Chinese woman, Julie, who had turned down his offer of marriage. Both Radha and Ashok are played by renowned film actors, and the film’s palette evokes the colors of the Indian flag: orange, green, and white.

Film’s Showing and Critical Reception

What made Fire so remarkable, as the filmmaker and professor Shohini Ghosh pointed out
in a 2010 monograph on the film, was that it was the first mainstream Indian film to deal with homosexual love, unlike other films on sexuality that hit the circuits around the same time that were relegated to film festivals and similarly obscure venues. This portrayal of a formerly taboo subject was made possible when, under pressure from international banking institutions, India was forced to open up its economy in 1991, which also dramatically transformed what Indian citizens could watch on television and in movie theaters. Not only did television programming expand beyond the predominantly state-mandated content, but viewers began renting movies to watch in groups; choice had entered the arena of home viewing—a matter that the film dramatized in several ways. Both the English and Hindi versions of Fire opened in forty-two theaters throughout India in 1998 under these circumstances.

Fire had been reviewed well, bolstered by several international festival awards. In a 6 November 1998 article in the Times of India, the film’s distributor described the film as being about masturbation and lesbian interaction, although he was cautious about its prospects; after all, it had no songs. However, it showed to packed houses that were at 80 percent to 90 percent capacity. Several theaters had women-only shows, and many viewers went to see it multiple times.

Like all mainstream films, Fire had to be reviewed by India’s Central Board of Film Certification, notorious for cutting scenes and asking for rewrites, especially in instances where films were even mildly explicit about desire or sex. In the case of Fire, the board, led by Asha Parekh (nicknamed “Ms. Scissorhands” for her aggressive approach to censorship), released it uncut because it was considered an important movie for Indian women. The board asked for only one change: that the name Sita be changed (in both the Hindi and English versions, though there is some dispute over this) to Nita. The shift in names articulates an awareness of modern evocations of Indian womanhood that signify through the mythic character Sita, the heroine in the epic Ramayana who had been abducted and her chastity eventually questioned, and although this was never said at the time, it became a point of contention as the debate over the film wended its way through various venues.

The film itself received mixed responses from feminists. Some were perturbed that both women were married, which they believed abrogated the political efficacy of the challenge that two single women trotting off into the sunset together might pose. By contrast, many queer commentators had a much more positive take on the film, seeing in the movie’s lower-middle-class, thoroughly mundane household, chock-full of the iconographic and plot conventions of religiosity, a challenge to the seemingly seamless collusion between everyday domesticity, ritualized religion, nationalism, and desire—and perhaps seeing that challenge more deeply than if it had been queer in the ways advocated by its detractors. Ironically, right-wing commentators concurred, suggesting that if women were given the option of running away with other women, they might not be so amenable to being domesticated in the usual fashion, through marriage to a man. (Sita, recently married, tries
to pique the interest of her new husband before she turns to Radha; Sita is more adventurous than the sedate Radha, and this flips the usual expectations associated with each name.)

Conservative Backlash and Counterprotest

*Fire* drew the ire of conservative Hindus. On 2 December 1998 some 200 Shiv Sainiks (members of a local right-wing Hindu organization/party, Shiv Sena), both men and women, stormed into two theaters, New Empire and Cinemax, in Mumbai, broke the glass on the display windows, damaged a ticket counter, and burned posters of *Fire*. In response, theater managers canceled showings of *Fire* in Mumbai. Theaters in New Delhi—including the iconic Regal in Connaught Place—were attacked by members of Shiv Sena almost immediately after the show opened to packed houses at noon on 3 December; in Kolkata cinemagoers carried Shiv Sainiks out of the theater when they attempted to stop the film. Meanwhile, a cinema hall in Pune had withdrawn the Hindi version of the film, voluntarily.

Opposition members of the Rajya Sabha (the upper house of the Indian parliament) lodged complaints against Shiv Sena’s attempts to shut the film down, while filmmakers, writers, and artists also rallied to protest the violent shutting down of the film. Between the first
week of December 1998 and February 1999, demonstrations abounded. One in New Delhi included thirty-two organizations of local women’s groups who held a candlelight vigil in front of Regal Cinema. The campaign for lesbian rights had begun in New Delhi, and women came together to make posters, enter into discussions, and begin the process of consolidating the issues they felt needed to be enunciated and vocalized—issues that brought sexuality to the fore. Members of organizations in various cities in India and within the diaspora, including Stree Sangam in Mumbai, SALGA in New York City, and CALERI in New Delhi, took to the streets to protest the violent opposition to the film. In Mumbai, Stree Sangam put up 1,000 posters, with community help, that stated in vivid red against a stark white background, “They destroyed the Mosque, dug up a cricket pitch, burnt paintings, throttled music, stopped a film from being shown, will Mumbai just stand by?” The Times of India (4 December 1998) called the poster a bold statement against cultural terrorism. Mumbai is the heart of Shiv Sena territory, and residents had become familiar with that organization’s overt and sometimes more subtle forms of violence.

The political situation in India at the time was fraught. Several seasons of bad harvests had voters ushering right-wing incumbents out of office, and the Right’s retaliation against Fire, as the poster in Mumbai made clear, was only one of many such at the time. Losing its base, the Right struck out against what they designated foreign infections (including lesbians). Ironically, and in a perversely Foucauldian form, the Right’s attempts to suppress events, objects, iconography, access to religious spaces, cricket games, and music they deemed objectionable exploded in an efflorescence of resistance and conversations around precisely what they wanted spirited away or excised from immediate view. Because the controversy around Fire went beyond gender representation to include battles over freedom of choice and freedom from censorship, it drew in others from outside the queer community. Queer political organizing hit the mainstream, not just as itself but as part of an amalgam, and not just in local settings but on the national stage. Earlier refusals from feminists to make sexuality seminal to their political projects out of a belief that they needed their attention directed to issues deemed more pressing, such as wife burning, were laid aside.
Poster Denouncing the Violence Associated with the Movie Fire. Activists put up thousands of these posters around Mumbai to protest against violent attempts by conservative Hindus to stop showings of Fire. The poster in Hindi is translated as “They destroyed the Mosque, dug up a cricket pitch, burnt paintings, throttled music, stopped a film from being shown, will Mumbai just stand by?”

“What you can’t see, you can see. You just have to see without looking.” These sentences from the film signpost ensuing habits of viewing. For a short time, *Fire* mainstreamed sexuality into feminist projects. *Fire* produced both expected and unexpected alliances, echoed in diverse coalitions across the nation coming out for queer exigencies, such as the multitude defying the Supreme Court of India's 2013 decision in favor of the sodomy statute. The film shows the women engaging in religious rituals such as *karva chauth*, a daylong fast completed by Hindu women for the safety and longevity of their husbands, which, in the movie, is completed by the two female leads while flirting elegantly with each other. These rituals are juxtaposed alongside the effusive consumption of melodramatic television serials that play out the story underlying the rituals by two errant witnesses (their mother-in-law and the masturbating factotum, Mundu). Many queers searching for recognition in India turn to religious archives for evidence, hunting assiduously for queer subjects in religious texts. By using *karva chauth* in this way, *Fire* posits that these ventures lead to a dead end. Instead, the film suggests, the religious past makes sense in the playful rescripting by the women and in the over-the-top televisual form, in the shapes it assumes in the present—shapes that in this case have been turned to queer designs. *Karva chauth* and each commonplace occasion in the household the women shared become something
else in the film—what the film has the viewer begin to grasp via allegorical realism is mundane homosocial female closeness, especially in putatively heterosexual domesticities, staged as queer; it trains all audience members to read askew, finding homoerotic titillation where once they might have merely noticed or floated by everyday pooled habits of cooking, washing, massaging, picnicking, and so on. The film thus inaugurates, in Ghosh’s (2010) words, “retrospectatorship” as everyday practice so that what was once seen as homosocial could be discerned as homosexual.

*Fire* left its spoor on cinema; desire and sex between women came to be much more quotidian in mainstream cinema. These traces were even evident in miscarriages where narratives married the phobic to erotic and killed off one woman lover, such as in the film *Girlfriend* (2004). A more recent homage to *Fire* was spectralized in *Dedh Ishqiya* (2014), another take on the Chughtai story. Here the women abscond with one another, and the male protagonists have to review their own conventions of looking to provide, in *Fire’s* wake, another paean to viewing askance folded into the movie’s denouement.

**FILMOGRAPHY**

The sexual activities of the Nahuas, the indigenous Nahuatl-speaking peoples of central Mexico (more commonly, and incorrectly, known as the Aztecs), before the Spanish conquest (1519–1521), included categories to describe same-sex sexual behaviors, although such categories are unclear to observers today and certainly did not suggest immutable identity. The Nahuas also had individuals who cross-dressed and may have engaged in some activities most often reserved for individuals who had been born into the other sex. Yet, it would be anachronistic to argue that lesbian, gay, bisexual, and transgender Nahuas existed before the conquest. There is simply no evidence of the existence of such sexual identities before the conquest, and there is one important piece of evidence that shows that such identities could not have existed: the Nahuas, like many other Mesoamerican peoples before the Spanish conquest, did not have a discreet category that can be called “sexuality.” Instead, they connected sexual activity with fertility and sacrifice—aligning them with the larger cosmology and with processes of death and rebirth.

Background on the Nahuas

Two main principles organized Nahua thought about sexual behaviors and desires (Sigal 2011). First, sexual behavior related directly to the fertility rituals, which were ceremonies that promoted the concept that everything and everybody must maintain and support fertility (particularly designed to support the fertile earth) in order for the community to survive (Quezada 1975). Second, one needed to maintain moderation in respect to sexual activity. In Nahua thought, moderation was considered a virtue, and excess a vice.

Before the Spanish conquest, Nahuas did not equate sex with “sin.” The concept of sin did not adequately translate into the Nahuatl language, much less the cultural framework for that language. The Nahuatl term tlatlacalli roughly corresponded with a sense of disorder and disarray. After the conquest, the Franciscan friars, who acted as linguistic experts, translated tlatlacalli as pecado (sin), believing this to be the Nahuatl term most closely
associated with the various concepts that Europeans associated with sin (Burkhart 1989). Still, Nahuas believed that sexual activity linked them with the earth and the cosmos, and they did not think of any particular sexual acts as spiritually problematic. They did not think of sex as necessarily good or bad, although they did deem excess sex (like anything in excess) dangerous.

Representatives of the Catholic Church—especially the Franciscans and the Dominicans—who encountered the Nahuas found their views of sexual behavior problematic. They attempted to get Nahuas to link sex with sin, often using particular indigenous concepts (of trash, dirt, dust, damage, and excess) as terms that could be used to train Nahua individuals to think of sex itself, in theory and practice, as sinful. The missionary attempt, through instruction and the sacrament of confession, at conquering Nahua thoughts about sexuality largely failed, instead eventually producing a hybrid sexual system that still survives today in many indigenous Mesoamerican societies (López Austin 1988). Although conscious efforts by Spaniards to alter Nahua ideas of sexuality for the most part did not succeed, much change did occur as the Nahuas came into daily contact with Spaniards, Christianized Africans, and their descendants. During the same period, however, Nahua commoners connected sexual desires with preconquest gods and goddesses, and both nobles and commoners had great difficulty understanding the clerical concept of sin.

Having said this, and despite numerous studies of the available Nahuatl-language texts and Spanish-language documents, the contingent nature of modern knowledge of Nahua sexual desire and behavior should be emphasized. Spanish authorities mediated the postconquest Nahuatl-language documents. Even for those cases when Nahuas wrote the documents outside of Spanish influence, it is important to note the internal conflicts and external power relations involved in the production of those texts. Furthermore, because preconquest Nahuas wrote in pictographic form, these sources require significant decoding of the painting process. Spanish-language sources that broach Nahua sexuality, often produced in the context of criminal trials or inquisitorial proceedings, are even more opaque.

As Pete Sigal notes in The Flower and the Scorpion (2011), Nahua nobles on the eve of the Spanish conquest believed that the flower signified, among other things, excessive sexual desire. Nahua commoners believed that the existence, life, and death of the scorpion showed them the ways in which the gods manipulated human sexual behavior. The Nahuas wrote extensive texts, often in the form of songs, about flowers. In these documents, they used the flower as a metaphor for sexual excess, including mock intercourse that took place during massive ceremonies designed to invoke fertility. In one of these ceremonies, known as Ochpaniztli (The Sweeping), some men wore giant paper phalluses and engaged in mock intercourse with a priestess dressed as a goddess. Such a rite, frowned on as excessive in daily life, was encouraged during this ceremony.
Nahuas also, at least until the seventeenth century, performed curing ceremonies in which issues of gender and sex played central roles. In one such ceremony, performed by Nahua commoners, a cross-dressed male curer would take on the identity of a goddess in order to engage in mock sexual intercourse with an individual sick from a scorpion sting. As the curer did this, he called on a myth in which the goddess once seduced a warrior, preventing that warrior from engaging in his duty. The goddess then beheaded the warrior, who became a scorpion. The myth says that this is why people no longer die from scorpion stings. The cross-dressed curer, calling on this mythology, symbolically seduced the scorpion through this intercourse and then beheaded that scorpion, preventing the scorpion’s venom from killing the patient.

These stories of the flower and the scorpion, related to Nahua metaphor and myth, demonstrate that indigenous understandings of sexuality were different from the views of the Spanish colonizers, who tried to fit them into their own notion of “sin,” and that these concepts are at least partially unknowable to people today. However, some Nahuatl and Spanish texts can still provide great insight into sexual imaginations, desires, and acts.

**Florentine Codex**

As with any study of sexuality among people outside of the modern Western world, one must try as much as possible to study their words and actions independent of Western influence. In the case of the Nahuas, one would think that this would be easy: they had a written language before the Spanish conquest, and they continue to speak, read, and write in this language today. Yet, few documents exist from before the Spanish conquest, and, as is described below, even Nahuatl-language documents from after the conquest betray significant Spanish influence.

This entry provides two examples of such writing, both from a text called the Florentine Codex (*Sahagún 1979*), a mid- to late-sixteenth-century ethnographic text written in Nahuatl and Spanish. This document was based on extensive interviews conducted by a Franciscan friar, Bernardino de Sahagún (1499–1590), and four Nahua individuals in a series of Nahua communities a generation after the Spanish conquest. From this source, particularly when combined with other Nahuatl- and Spanish-language texts, a unique understanding of “homosexuality” in Nahua communities can be gleaned. That said, one cannot begin to understand Nahua conceptualizations of same-sex sexuality without carefully decoding such texts.

In the mid-sixteenth century, with the support of the Franciscan order, the largest mendicant order of the Catholic Church in the Spanish Empire, Sahagún began an extensive ethnographic research project that would become the *Historia general de las cosas de Nueva España* (*General History of the Things of New Spain*), a massive work divided into twelve books and more commonly known as the Florentine Codex. Sahagún produced this text in
coordination with four Nahua aides—his “trilinguals”—individuals fluent in Nahuatl, Spanish, and Latin. Sahagún and the aides went to several Nahua communities and spoke to a group of elders in each community. They asked those elders to describe the rituals, histories, flora, fauna, and social customs as they had existed at the time of the Spanish conquest. The text was written in parallel columns of Nahuatl and Spanish, with the more extensive Nahuatl text accompanied by a significant number of illustrations. By the time the project was finished in the late 1570s, the Catholic Church and the Spanish monarchy were less interested in ethnographic accounts of the indigenous populations, so the Historia general was sent to Seville and then, at some point, given as a gift to somebody in Florence (hence its name, the “Florentine” Codex). It eventually made its way to the Biblioteca Medicea Laurenziana in Florence, where it is currently housed.

FROM BOOK 10 OF THE FLORENTINE CODEX.

Gay Nahuas? As Sahagún and his aides began this ethnographic project, they made some notes that would come to be known as the Primeros memoriales (First memorials), a collection that comes from their first ethnographic interviews from the 1550s, in the Nahua community of Tepepulco (Sahagún 1993). In only one place does one find “homosexual” activity or, for that matter, quotidian sexual behavior of any kind: toward the end of a folio where one reads in Sahagún’s own hand the terms patlache, cuiloni, and other terms that may, perhaps, be linked with sexuality. The rest of the text is written in the handwriting of the aides. It is not known why the Franciscan friar intervened here, but this suggests the contrived nature of such a text. As the text is only in Nahuatl, it is not even possible to know the Spanish terms that the friar may have used to elicit the Nahuatl words. Patlache, as is noted in the next section, has been used (incorrectly) to suggest a Nahuatl term for “lesbian.” Similarly, some have argued that the Nahuatl term cuiloni was used to describe “gay” sex (Kimball 1993), but one must take such a claim with a grain of salt. The Franciscan friar Alonso de Molina, in his sixteenth-century Nahuatl-Spanish dictionary, used the Spanish term pecado nefando (“nefarious sin” of sodomy) as a translation for
cuiloni (Molina [1569] 1984, 2:27r). He also translates puto (faggot) as cuiloni (1:100v).

In Book 10 of the Florentine Codex, which focuses on people’s daily lives, Sahagún and his aides expanded their intervention into Nahua homosexuality by developing cuiloni into a decontextualized quasi-identity. Here the authors connect cuiloni with “excrement, corruption, filth, ... [and] effeminacy,” among other things. A cuiloni also “passes himself off as a woman.” As a penalty for his acts, he is “burned.” Indeed, the second image in Figure 1 one shows a person executed by fire.

With so little context, though, it is impossible to know if this image and text came from a European or a Nahua framework—or, more likely, some combination of the two. The term cuiloni appears to be derived from cui, “to take,” and the passive–loni suffix, obscurely suggesting that a cuiloni is “one who is taken.” The term cuiloni is rarely found in any other texts except for the highly contrived, bilingual (Nahuatl and Spanish) confessional manuals that were used to train priests to hear the confessions of their parishioners. Spanish chronicles, criminal trials, and similar documents show that some Nahua men had sex with other men. They also show that some Nahua men dressed as women—or at least the Spanish observers perceived them as dressing in such a manner. In the image in Figure 1, the individual on the right side of the flower has the hair and clothing that the Florentine Codex artist regularly depicted as the hair and clothing of a woman. Could this have been a cross-dressed man? The fact that this image refers to a cuiloni certainly suggests such an interpretation.

Simply put, Nahuas from before the Spanish conquest would not have understood the term, category, or concept of being “gay” (or, for that matter, “transgender”). While there is evidence of men engaging in sexual activity with other men, and there is yet more evidence that biological males dressed in women’s clothing (Trexler 1995), Nahuas did not have a term that can be translated as “sex.” Sexual behaviors instead fell under other categories, particularly those linked with sacrifice and, as discussed below, with “trash.” If the Nahuas did not have a term for either “sex” or for “sin,” then they could not have understood specific sexual identity categories. The simple (and facile) translation of cuiloni as “faggot” or “sodomite” misses this key point. Instead, it seems likely that cuiloni referred to a set of actions that became reinterpreted in the production of the Florentine Codex and in the context of the Spanish conquest.

Lesbian Nahuas? It would seem impossible for Nahuas to have understood the category “lesbian,” which leaves open the question as to what Spanish phrase Sahagún used to elicit the word patlache from the Nahua elders. One possibility is the obscure terminology used by his Franciscan colleague Molina, in his dictionary definition, hazerlo vna muger a otra (“for one woman to do it to another”; Molina [1569] 1984, 2:80r). The entry for patlache in Book 10 of the Florentine Codex does not provide much help. Sahagún translates the term as hermafrodita (hermaphrodite). The Nahuatl text says that “the patlache is a filthy
woman, a woman with a penis, possessor of an erect penis.” Furthermore, “she does it to another woman [tepatlachuia],” and “she makes a woman her friend.” In Figure 2, one sees a standing individual with women's breasts exposed but with a hand hiding his or her genitals. The person wears only a man's cape and stands and talks to another person, who is dressed as a woman and seated. The standing person may be a figure of indeterminate gender, but there is no way to know this. The person appears to be simply a woman wearing a cape, but it is impossible to understand how a sixteenth-century Nahua individual would have interpreted this image.

FROM BOOK 10 OF THE FLORENTINE CODEX

Figure 2 from the Florentine Codex Showing a Patlache. In this illustration, a figure is shown with a woman's breasts but wearing a man's cape, possibly indicating the figure is a hermaphrodite or a woman who has sex with women. The term for such a figure, patlache, defies categorization.

Here, in the movement into the Florentine Codex, it would seem the term patlache has become utterly indefinable. It is unclear if this individual is a hermaphrodite. And, if so, whether her or she has sex with women. It is impossible to determine if sexual activity between this in-between gender individual and women would be analogous to a modern lesbian. One thinks not, and perhaps this marks the limits of the ability of present-day scholars to understand preconquest Nahua sexual categories.

By thinking about the Florentine Codex as a quintessentially hybrid text—produced by and through colonial encounters of language, religion, and culture—perhaps more of the context for these sexual identities can be understood. Sahagún and his partially Hispanicized aides would have known about Spanish and Christian categories. In this
context, sexual sin became a key theme, as did the Spanish denigration of individuals deemed putos (faggots) and hermafroditas. These individuals, deemed monstrous in the Spanish imagination, became transferred onto the Nahua context through the terms cuiloni and patlache.

**Trash**

For the Nahuas, the concept of tlazolli (trash) was central to the ideas of order and disorder that relate to Nahua sexual categories and acts. Although tlazolli is most often translated into English as “trash,” it meant much more. Tlazolli to the Nahuas linked closely with the excess they believed necessary to produce the large ceremonies so central to Nahua society just before the Spanish conquest. Tlazolli was a sign of ritual and sacrifice, and the bulk of those activities that Westerners consider to fall under the category “sex” fell under the category of tlazolli for the Nahuas. Nahuas in this sense did not see any sexual activities as sinful, but rather they saw them all as potentially pleasurable and as both ritually and symbolically positive for society. Nahua discourse strongly supported bodily pleasures, practiced in moderation, and condemned excessive indulgence in such pleasures. In the years prior to the Spanish conquest, cuiloni and patlache would have related to tlazolli rather than to a sexual identity of any kind.

In the early colonial years and through at least the late sixteenth century, Catholic priests attempted to alter the Nahua discourse to mandate a connection between sex and sin, but they failed to fully accomplish this change. Instead, the Nahuas adjusted their sexual performances to accommodate the changes mandated. They began to assert a hybrid discursive framework in which excess would lead to spiritual condemnation, whereas moderation remained connected with fertility and fulfillment. Only through the study of indigenous language sources can scholars work to understand Nahua ways of adapting sexual subjectivity to colonial and postcolonial rule.

Fortune and Men's Eyes

JASON B. CRAWFORD
Instructor, Department of Humanities
Champlain College, Canada

The 1967 play and 1971 film adaptation that highlighted both the injustice of Canada's prison system and its treatment of homosexuals.

Fortune and Men's Eyes (1967), by the Canadian playwright John Herbert (pen name of John Herbert Brundage [1926–2001]), is the most widely produced Canadian English-language play and was the first Canadian play to address homosexuality and violence within prison. The title comes from the opening line of Sonnet 29 by William Shakespeare:

When, in disgrace with fortune and men's eyes,
I all alone beweep my outcast state,
And trouble deaf heaven with my bootless cries,
And look upon myself and curse my fate.
The play and the subsequent film adaptation are an indictment of the particular historical context of society's aversion toward homosexuality and its ignorance of the effects of prison on inmates' lives. At the time of the play's production, homosexuality, appearing in public in drag, and performing in drag in bars were still illegal in Canada. Individuals convicted of these crimes could be sentenced to lengthy prison sentences. These acts would be decriminalized only in 1969.

**Background**

The play's story is semiautobiographical, based on John Herbert's six-month imprisonment in 1947 at a reformatory in Guelph, Ontario, on trumped-up charges of solicitation. In 1946, while dressed in drag, he was mugged, but when confronted by the police his assailants accused him of soliciting them. Herbert was then charged with gross indecency and sentenced to the youth reformatory. During his incarceration, Herbert was raped and beaten—corporal punishment being a legal method of punishment at that time in Canadian prisons.
**Plot**

The play centers on four main characters in a single prison cell: the teenager Smitty, sentenced for stealing a car; Rocky, the dominant and aggressive male; Queenie, a drag queen in prison for prostitution and the self-described “Mother of the Cell”; and Mona, a young gay man wrongly imprisoned for solicitation. The story explores the dominant/submissive roles that structure prison life, as well as the brutal physical and violent sexual realities inside prisons.

The play opens with Smitty’s arrival at the prison and his subsequent “education” about the ways of prison life. Rocky takes ownership of Smitty by manipulating him into believing that he will protect Smitty from being gang raped by other prisoners. Smitty submits to Rocky’s sexual appetite but grows weary of being Rocky’s “property.” Queenie also manipulates Smitty into challenging Rocky’s authority, and Smitty subsequently beats Rocky into submission. Queenie’s agenda is to gain further power within the prison, and Queenie sees Smitty as a potential ally. Now dominant, Smitty seeks to take ownership of Mona. When Mona refuses, Smitty attempts to rape him. By the end of the play, Smitty has been transformed by the violent sexual culture of the prison and challenges the audience to face the hypocrisy of prison as a place of positive social reform (Dickinson 2002).

**Reception**

Herbert attempted several times to have the play produced in Canada, but producers fearful of putting on a play that dealt with homosexuality meant the play would not receive its premiere in Canada. Through the efforts of the Toronto-based theater critic Nathan Cohen, the play was produced in New York City at the Actors Playhouse, where it ran from February 1967 to January 1968 and was directed by Michael Nestor (Wagner 2013). The play received mostly mixed reviews from critics but was generally well received by its audiences, not only in New York but also eventually in Canada and in numerous countries and translations. A 1967 postperformance audience discussion in New York City led to the creation of the Fortune Society, a nonprofit organization that advocates for prison reform and offers services to help former prisoners reenter society.

*Fortune* was granted special recognition by the US Library of Congress for its contributions to social reform, and in 1971 Herbert was inducted into the Société des Auteurs et Compositeurs Dramatiques (Society of Dramatic Authors and Composers) in France. In 1975 the play received the Floyd S. Chalmers Canadian Play Award, and in 1967 Herbert was granted a lifetime membership in the US organization Actors Studio. Herbert went on to write sixteen more plays, but few were produced, and he remains best known for *Fortune and Men’s Eyes*.

**Importance**
Most of Herbert’s writing and directing focuses on theater as social criticism, and the difficulty of getting *Fortune* produced in Canada demonstrates the reaction against the vitriolic challenge that Herbert’s script launches at Canadian society. The story’s blatant depiction of homosexuality and camp, rape and violence, materialism and corruption of power challenged Canadian society to see itself for what it was and to see the marginalization and brutalization of nonheterosexual-identified peoples. As Herbert describes it, his play is like a mirror held up to Canadian society:

> As I see it, in this small setting of a reform institution cellblock the whole political situation is intensified. The same things are wrong with our [Canadian] society as a whole, but they rise to the crest in the cellblock.... The manipulation and consuming of one human creature by another breaks through the surface.

*(DEMPSEY 1967, 47)*

However, reviews of the play were decidedly mixed. Toronto theater critic Cohen championed the play’s social criticism, whereas New York critic Norman Nadel railed with disgust at the portrayal of homosexual behavior on stage (*Wagner 2013*).

**Film Adaptation**

Herbert went on to write the screenplay for the 1971 film adaptation, which was directed by the Canadian filmmaker Henry Hart (who replaced the original director, Jules Schwerin) and filmed on location at a prison in Quebec City, Quebec. The film was criticized by various reviewers, including the out gay film historian Vito Russo, for its stereotypical representations of effeminate homosexuals and for not effectively challenging the heteronormative aspects of society through the film’s focus on violence in prison. The film has since been recognized as making a significant contribution to Canadian gay film in English (*Waugh 1999*).

*Fortune* and *Men’s Eyes*, as a play and as a film, challenges audiences with its wit, camp humor, and brutal truth telling. The play premiered two years before the Stonewall riots in New York City during a time of social and political turmoil in both Canada and the United States. Herbert’s message for society to wake up and face the fact that the criminalization of homosexuality and the effects of imprisonment on people’s lives was a bold step in helping to create a visible gay and lesbian community. Despite the decriminalization of homosexual acts in Canada in 1969, discrimination continued. *Fortune* provides an important historical account of a time and a place that should not be forgotten.

BIBLIOGRAPHY

If there is one name nearly synonymous with LGBTQ history, it is Michel Foucault (1926–1984). A French philosopher, historian, and activist, Foucault was an enabling force in the emergence and development of queer history. For decades, Foucault’s work has been read and misread in widely differing national contexts and across divergent academic disciplines. It has attracted substantial criticism, particularly from feminist and postcolonial scholars. Such a layered legacy and complicated reception, it need be noted, makes any brief overview of his contested influence a fraught endeavor, one particularly prone to oversimplification.

By the time Foucault began to publish on the history of sexuality in the mid-1970s, he was already an intellectual giant. Foucault’s earlier work, on topics ranging from madness to medicine and criminality, appeared in such well-known books as *History of Madness* (2006; originally published in French as *Folie et déraison: Histoire de la folie à l’âge classique* [1961]) and *Discipline and Punish: The Birth of the Prison* (1977; originally published in French as *Surveiller et punir: Naissance de la prison* [1975]). But it was the multivolume project *The History of Sexuality* that helped inaugurate a new field of study, and on a global scale. The introductory volume, *Histoire de la sexualité, 1, La volonté de savoir* (*The History
of Sexuality, 1: The Will to Knowledge), appeared in France in 1976 and was immediately translated into Italian, German, and Portuguese, quickly followed by Spanish and Greek. By the mid-1980s, editions in Japanese, Chinese, and Turkish, among other languages, were in circulation. The book first appeared in English in 1978 as The History of Sexuality, volume 1, An Introduction.

Sexuality as Historical Construct

Foucault’s short book had an explosive impact. It challenged much commonsense thinking, which either rooted sexuality in nature or stressed its biological basis. Against such conventional wisdom, Foucault insisted that “sexuality must not be thought of as a kind of natural given” (1978, 105). Better, Foucault maintained, to think of sexuality as “the name that can be given to a historical construct” (105). The history of sexuality, Foucault argued, was “not a furtive reality that is difficult to grasp, but a great surface network in which the stimulation of bodies, the intensification of pleasures, the incitement to discourse, the formation of special knowledges, the strengthening of controls and resistances, are linked to one another, in accordance with a few major strategies of knowledge and power” (105–106).

This key idea—sexuality as “historical construct”—proved immensely influential in what during the 1970s and 1980s came to be known as social construction theory. Social constructionism held that sexuality was not a timeless, unchanging feature of human life—a view known as essentialism—but something “constructed” by myriad social forces that varied over time and were subject to vast cross-cultural differences. While Foucault is often given credit as the originator of social construction theory, the truth is he did not come up with the idea alone. Across the Anglo-American world during the 1970s, those active in the feminist and gay/lesbian liberation movements also found essentialist notions of sexuality wanting and were busy devising social constructionist accounts of the sexual past. A full decade before The History of Sexuality appeared in English, Mary McIntosh, a British socialist-feminist lesbian, published “The Homosexual Role” (1968), in which she argued that there existed no transhistorical homosexual, only categories and experiences of same-sex relations that shifted over time.

As McIntosh’s reference to role theory suggests, many of the early adopters of Foucault were sociologists. As Jeffrey Weeks, another British sociologist and one of the earliest and most sensitive interpreters of Foucault in English, remembers it, “What we found in Foucault was resonance rather than revelation” (2005, 189). In North America, feminist historians such as Carroll Smith-Rosenberg drew productively on Foucault, while Foucault had high praise for the lesbian historian Lillian Faderman’s pioneering book Surpassing the Love of Men (1981). Perhaps paradoxically, among groundbreaking gay historians such as Jonathan Ned Katz, Martin Duberman, and John D’Emilio, the influence of Foucault remained muted. Still, there can be no doubt that Foucault’s intellectual stature stamped
the history of sexuality with a new legitimacy.

Foucault did more than denaturalize sexuality by giving it a history. In fact, Foucault was not much interested in historical subjects such as the change in attitudes toward sexuality over time. For Foucault, such an approach missed the mark, for it presumed the existence of precisely what ought to be the object of historical inquiry: sexuality itself. Foucault argued that the very concept of “sexuality”—the notion that individuals each have a sexual identity and can be categorized into different groups on the basis of shared sexualities—was a historical creation, one that first emerged in the eighteenth century, coincident with the development of capitalism, and cohered in the nineteenth century around an array of medical, legal, pedagogical, and familial processes and institutions. In short, sexuality was an invention of modernity. In the subsequent volumes of his series, Foucault proposed to track the emergence and solidification of modern sexuality by tracing the genealogy of four great strategic unities: the hysterical woman, the procreative couple, the masturbating child, and the perverse adult.

Acts versus Identities

Foucault's “pervert” proved pivotal for queer history. Indeed, his queer readers zeroed in on and greatly magnified what is perhaps the most frequently quoted passage from The History of Sexuality, one related to the historical emergence of the homosexual. Foucault argued that in the early Christian era sodomy constituted “a category of forbidden acts” (1978, 43), but as sodomy passed through the apparatus of sexuality, the “nineteenth-century homosexual became a personage” (43). Through its “incorporation of perversions” and its “specification of individuals” (42–43), a new type of person emerged, one defined not simply by a sexual act—sodomy—but by a certain sexual sensibility or all-encompassing identity. As Foucault famously put it, “The sodomite had been a temporary aberration; the homosexual was now a species” (43).

Not all historians signed on to Foucault's argument about the nineteenth-century invention of the homosexual. Some scholars, such as John Boswell (1980), insisted that “gay people” could be found as far back as the early Christian era. There is also much debate over whether Foucault intended such a dramatic distinction between acts and identities. Whatever the case, the formulation stuck, and the “act versus identity” distinction represented one of sexual history's first major conceptual breakthroughs. It not only gave a leading role to the homosexual in the history of sexuality, it provided a way to think about all sexual identities as fundamentally historical.

Power/Knowledge/Discourse

Much of the initial enthusiasm for The History of Sexuality among lesbian/gay activists rested on a reading of it as a political manifesto and a theoretical text. Apart from some
early interpreters, such as Weeks, who appreciated and elaborated on the historical in Foucault, many historians approached the work with a skepticism rooted in the belief that Foucault was more a theorist than a true historian. This was a misapprehension of Foucault’s project, which he undertook at the height of his interest in formations of power/knowledge. The French subtitle of the introductory volume, omitted in the English translation, is La volonté de savoir (The will to knowledge), underscoring that, for Foucault, sexuality was first and foremost a domain of knowledge marked by the will or power to characterize, classify, and control it. Moreover, for Foucault, knowledge and power were always historically specific formations. For example, he assigned a central role to nineteenth-century doctors and their specialized knowledge of psychiatry and sexology in the historical emergence of the homosexual. The historical emergence of that same homosexual also provided Foucault with an illustration of his argument about the productive capacity of power (which one could say is the true subject of The History of Sexuality) to incite new discourses and to proliferate new sexual subjectivities. This “veritable discursive explosion” around sex beginning in the eighteenth century delivered a blow against what Foucault dubbed “the repressive hypothesis”—the idea that sexuality as power only ever functioned in a negative fashion to censor and silence (1978, 17).

Historians, however, tended to restrict their engagement with Foucault to the level of empirical correction, treating, for example, Foucault’s dating of the homosexual’s birth to 1870 as an error of historical fact rather than a rhetorical device. Homosexual identity, they countered, could be found much earlier throughout Renaissance and Enlightenment Europe. Historians also favored setting Foucault up to knock him down in their arguments against the medical-discursive invention of homosexuality. Many, however, radically oversimplified what Foucault meant by “discourse,” viewing it narrowly as written texts or language, even when Foucault made clear that discourse should be understood not as “abstract” or “speculative,” but in “the form of concrete arrangements,” as “institutions of power” and as “techniques of power,” from the architecture of schools to “the great instruments of the state” (1978, 140–141; emphasis in the original).

It was a fateful misreading, for it coincided with and was conditioned by the rise during the 1990s of the linguistic turn and discourse analysis in the discipline of history. When Foucault proclaimed that “the history of sexuality … must first be written from the viewpoint of a history of discourses” (1978, 69), despite being written long before the linguistic turn in history, many LGBTQ historians, immersed in community and oral histories, and committed to a more or less materialist account of sexuality, linked Foucault with the linguistic turn, and turned away. If Foucault never entirely disappeared from the field—historians continued to draw on Foucault’s authority by frequently citing, if not engaging with, his work—his influence, particularly among social historians, began to wane.
Biopower, Truth, and Technologies of the Self

As the field of LGBTQ history continued to develop through the 1990s, historians remained relatively uninterested in what they regarded as Foucault’s theoretical speculations, largely ignoring, for instance, Foucault’s thoughts on biopower—that is, sexuality as the crucial historical linchpin between the disciplining of individuals and the regulation of populations. Historians were also impatient with his philosophizing about “the truth of sex.” But for Foucault, the significance of sexuality—the objective in writing its history—was to answer the question of how, in addition to operating as an effective conduit for the relay of power, sexuality came to be the privileged locus for producing the truth about the human subject.

While Foucault had finished the research for many of the remaining volumes of *The History of Sexuality*, much of which he delivered in his now-published lectures at the Collège de France in the mid-1970s, he ultimately abandoned his original plan. Foucault decided it was necessary to first understand the place of pleasure and desire in periods “before sexuality,” and so, after an eight-year gap, just before he died from HIV/AIDS-related complications, the second and third volumes of *The History of Sexuality* appeared. *The Use of Pleasure* (1985; originally published in French as *L’usage des plaisirs* [1984]) and *The Care of the Self* (1986; originally published in French as *Le souci de soi* [1984]) examined the role of the erotic in ancient Greek and Roman cultures. Foucault also placed much more emphasis on the self-stylization of the sexual subject through what he called “technologies of the self,” something he admitted he paid insufficient attention to in the first volume. One consequence of this temporal shift has been to stimulate debate over Foucauldian approaches to sexuality among historians of the ancient and medieval periods, arguably generating a more productive and ongoing engagement with Foucault among premodern and early modern historians than historians of modern sexuality.

Queer and Feminist Challenges

The past several decades of queer theory and queer history have produced ambiguous results for Foucault’s fortunes in the field. On the one hand, the nonidentitarian expansiveness of *The History of Sexuality*, including its attention to heterosexuality, Foucault’s endorsement of “bodies and pleasures” as the basis for a counterattack against the regime of sexuality, his well-known thoughts on the limitations of identity categories, and his own enthusiastic participation in urban sexual undergrounds, all this made Foucault and his work queer before queer politics and theory first emerged in the 1990s. On the other hand, prominent queer theorists did not shy away from criticizing the Foucauldian enterprise. Eve Kosofsky Sedgwick (1990), for example, called into question the usefulness of “the Great Paradigm Shift,” or the transition from act to identity, not so much on historical grounds, but for its unstated assumptions about homosexuality in the
In *Gender Trouble* (1990), Judith Butler delivered a sharp critique of Foucault's handling of Herculine Barbin, a nineteenth-century intersex figure whose memoirs Foucault published, and of his characterization in *The History of Sexuality* of a case from the French countryside of sex between a village man and a young girl as “inconsequential bucolic pleasures” (*Foucault 1978, 31*). For Butler, the trouble here is how Foucault romanticized sex before its capture by sexuality, something at odds with Foucault’s claim in the conclusion to *The History of Sexuality* that “sex” followed from, was an effect of, sexuality, not the other way around. Butler's was only one of many feminist critiques of Foucault’s inattention to gender.

Queer and feminist critiques, while delivered with due respect, had the effect of sidelining Foucault and clearing the way for Derridean deconstruction and Lacanian psychoanalysis—Jacques Derrida and Jacques Lacan being two theorists with whom Foucault differed, but whose ideas were more in keeping with queer theory’s poststructuralist and often ahistorical underpinnings. Among queer theorists with a historical orientation, David M. Halperin kept the Foucauldian faith with two books: *Saint Foucault* (1995), which anointed Foucault as the founding father of a radical queer politics, and *How to Do the History of Homosexuality* (2002), which attempted to resurrect a Foucauldian approach to the queer past.

**Postcolonial Critiques**

Some of the most sustained and provocative engagements with Foucault have come not from historians but from anthropologists, literary critics, and other scholars engaged in postcolonial studies. Throughout *The History of Sexuality*, Foucault repeatedly refers to “the West,” but the designation is more descriptive than analytically meaningful. On the few occasions Foucault ventured beyond the West, as in the contrast he set up between a “scientia sexualis” in the West and an “ars erotica” in “China, Japan, India, Rome, [and] the Arabo-Moslem societies” (*Foucault 1978, 57*), he displayed not only a dismaying Orientalism but also an ignorance about the histories of sexual science indigenous to places such as China, Japan, and India and their complex interactions with Western medicoscientific knowledge. Scholars such as Leon Antonio Rocha (2011) and Sanjay K. Gautam (2016) have pushed past Foucault’s distinction between the “scientia sexualis” and “ars erotica,” while recent efforts to globalize the histories of sexual science—to map the transnational circulation of sexual knowledge—promise to complicate Foucault’s overly simplified division between “the West” and the rest of the world (*Fuechtner, Haynes, and Jones 2018*).

Neither did Foucault consider how the periods and forms of sexuality he traced overlapped in what should have been obvious ways with Europe’s age of empire. Ann Laura Stoler read
The History of Sexuality alongside Foucault’s lectures on state racism, delivered in the same year the book was published, to interrogate the relative absence of empire and race in Foucault’s history of sexuality. Using Dutch colonial archives, Stoler argued that “Foucault’s tunnel vision of the West” blinded him to the ways European bourgeois sexuality depended for its definition on colonial power and the racialized bodies of colonial subjects (1995, 11). While Foucault could have found, had he wanted to, plentiful evidence of the imbrication of sexuality and colonialism in historical archives, Anjali R. Arondekar (2005, 2009), using the example of South Asian history and subaltern studies, questioned the very impulse to search for the history of sexuality in the colonial setting. Arondekar asked historians of sexuality to think hard about what is behind their desire to find Foucault’s sodomite in the colonial archive and what it means when one discovers barely a trace of such a figure.

Confession and the Return to History

While queer, feminist, and postcolonial critiques of The History of Sexuality continue apace, there are also signs of a new appreciation for Foucault as a historian. Lynne Huffer (2010) has redirected attention from the thin first volume of The History of Sexuality to the much thicker historical description of History of Madness as a proto-queer history. In Germany, historians have produced work on a wide range of sexual subjects to demonstrate what the field can encompass “after The History of Sexuality.” The 2016 translation into English of Foucault’s work with the French feminist historian Arlette Farge, Disorderly Families: Infamous Letters from the Bastille Archives, reveals their mutual fondness for archives and historical documents, particularly the lettres de cachet both spent decades researching. (In France, during the ancien régime, lettres de cachet were orders to arrest and imprison someone, sealed by the king and often solicited by people of humble background.)

More than four decades after the publication of the introductory volume of The History of Sexuality, a fourth and final volume, completed just before Foucault’s death but left unpublished, appeared in 2018. Les aveux de la chair (Confessions of the flesh) is widely regarded as the crucial missing link, both temporally and interpretively, between Foucault’s studies of pleasure in ancient culture and the modern period of sexuality. As Foucault only hinted at in the first volume of his history of sexuality, it was in the Christian confessional under pastoral power where one first sees the transformation from an injunction to confess the commission of sinful acts of the flesh to a demand to decipher sexual desires hidden deeper within. If the fourth volume is anything like the previous three, Foucault will once again enjoy influence over a field for which he has been formative—and in ways that are sure to be celebrated, contested, and conducive to new historical horizons.

BIBLIOGRAPHY

The Frente de Liberación Homosexual (FLH; Homosexual Liberation Front) was the first self-defined organization of homosexual men (and a few women) in Argentina, and quite possibly in all of Latin America. The FLH emerged as a coalition of smaller groups of activists, the first of which was known as Nuestro Mundo (Our World). Formed by unionized post office workers, the activists from Nuestro Mundo gradually recognized each other as homosexual men after union meetings and began to meet in cafés around the mid-1960s. The group was led by Héctor Anabitarte, who was originally an important union and community organizer in the Communist Party of Argentina. After Anabitarte came out of the closet, party officials sent him to a psychiatrist, who suggested a curative trip to the Soviet Union. Communists often equated homosexuality with “bourgeois decadence” and were convinced that homosexuality had been almost eradicated from the Soviet Union as a result of the existence of an allegedly healthier society. Anabitarte agreed to enjoy what was more likely a free trip, but back in Argentina he continued to reassert his homosexual identity publicly, and as a result he was relegated to lesser roles within the party. Later, he left to fully devote himself to homosexual politics.

By the early 1970s, several groups of activists would eventually come together as the FLH: the group known as Profesionales (Professionals), Alborada (Dawn), Safo (a lesbian group), the anarchist Bandera Negra (Black Banner), a group of left-wing humanities students known as Eros, and religious groups made up of several denominations including Emanuelle, Católicos, and Grupo Cristiano. Although many of the groups had emerged amid a growing wave of anticapitalist politics since the mid- to late 1960s, some of the members of the FLH did not belong to the Left. In fact, the activists shared no political agreement other than the desire to improve the situation and image of homosexual men who were persecuted by the police. In Argentina during the 1970s lesbian women would rarely identify themselves as such, so they did not feature prominently in the political agenda of the FLH. However, they played a fundamental role in the feminist movement, especially in the Unión Feminista Argentina (UFA; Argentine Feminists’ Union), which often worked in alliance with the FLH.

The FLH demanded the abolition of certain edicts— a body of bylaws created by the
Argentine federal police that violated the constitutional division between legislative and executive powers. These edicts against homosexual men had existed since the 1930s, and they were more repressively enforced in the following decades. Police harassment of homosexual men intensified during the regime of Juan Carlos Onganía (1966–1970) and in the 1970s. By the late 1960s, the police had accrued extensive lists of homosexual men who could be detained for a period ranging between a few hours and a month, depending on the arbitrary decision of the police agents in charge of the operation. As the situation for homosexual men worsened, this became the main impetus for the formation of the group that eventually created the FLH.

**Founding and Early Activities**

Nuestro Mundo and Profesionales formed the FLH in 1971. The latter group was created by a handful of intellectuals and writers whose ideas eventually shaped the FLH. Some of the writers in this group were already famous and well-published figures within Argentine intellectual circles, such as Juan José Sebreli and Blas Matamoro. Another participant, Manuel Puig, would later become internationally renowned as the author of *El beso de la mujer araña* (1976), adapted in 1985 by the Argentine-born Brazilian filmmaker Héctor Babenco as the internationally famous movie *Kiss of the Spider Woman*. One of the writers, Juan José Hernández, traveled to the United States in the early 1970s and became acquainted with the materials about lesbian and gay politics published by the Black Panthers. Surprisingly, Argentine activists were unimpressed by the Stonewall riots in New York City in 1969 that launched the wave of radical gay liberation groups in the United States and were more interested in an anti-imperialist platform that could help them establish an alliance with left-wing organizations in Argentina. Black Panther Huey P. Newton’s “A Letter from Huey Newton to the Revolutionary Brothers and Sisters about the Women’s Liberation and Gay Liberation Movements” (1970) provided such a platform and was translated into Spanish and circulated widely in Buenos Aires, especially within left-wing circles and the homosexual community. Below Newton’s letter, the FLH added a list of demands, emphasizing the release of all political prisoners and the end of police harassment of homosexual men.

Led by Néstor Perlongher (1949–1992), a group of radical students from the Facultad de Filosofía y Letras at the Universidad de Buenos Aires joined the FLH under the name of Eros soon after it was formed. A young sociology student, Perlongher had been an activist in Palabra Obrera (Workers’ Word), a Trotskyist party, before he became a homosexual activist. He eventually demanded this organization incorporate homosexual politics into its agenda, but he was denied, after which he created Eros with other students like himself. Unlike the writers from the group Profesionales, Perlongher was a man of action, and together with Anabitarte and others he pushed the members of the FLH to seek alliances with the Left and other groups. Although the Profesionales group was composed of
members of the Argentine left-wing intelligentsia, they were more academically oriented and preferred to write and study rather than directly engage in politics. For this reason, the relationship between the Profesionales and Perlongher became fraught with tension. This was one of the most important conflicts within the FLH.

As part of the politics of alliances promoted by Perlongher, the FLH developed a closer relationship with the UFA in the early 1970s. This feminist group was interested in issues that concerned all women, such as the critique of gender roles and the demand for legal equality and equal job opportunities, but it was also formed by many lesbian women who were also interested in themes more specific to their identities. Members of UFA and the FLH formed the Grupo de Política Sexual (GPS; Sexual Politics Group) around 1973 and began to read texts combining Marxism and psychoanalysis, such as the work of Wilhelm Reich and Herbert Marcuse. Although the relationship between the GPS, the FLH, and the UFA was quite fluid, informal, and difficult to define, the GPS would become the intellectual powerhouse of the FLH, publishing a 1973 summary of its views under the title *Sexo y revolución* (Sex and revolution) that would be republished and circulated widely, even outside Argentina.

### The FLH under Peronism

The year 1973 was crucial in the history of the FLH. After democracy returned to Argentina, and a Peronist government was elected that year, all political prisoners were released, and for a few months the persecution of homosexual men by the police came to a halt. The largest working-class political movement in Argentina between 1945 and the 1970s, Peronism, led by charismatic leader Juan Domingo Perón (1895–1974), was in favor of maintaining and expanding the welfare state. Excited by the return of Perón in 1973, the FLH lobbied Peronist congressmen and sought a place in the so-called process of “national liberation,” as left-wing Peronists called their ascension to power and the project for the new, stronger, and radicalized welfare state in Argentina that they had in mind. After Perón arrived back in Argentina in 1973 from his seventeen-year exile in Spain, however, the political situation shifted in favor of the right wing of the Peronist party. Partly because of this shift, the situation also quickly deteriorated for homosexual men. Perón distanced himself from the Left and pursued a right-wing agenda that affected the FLH’s chances of building alliances with Peronism.

For years, some members of the FLH led by Perlongher had been attempting to build an alliance with left-wing Peronism. This was a dividing issue within the FLH, as older members still remembered the extensive police raids on homosexual men under the Perón administration in 1954. Despite the association of Perón with antihomosexual politics, when he returned to Argentina in 1973, a group of activists from the FLH joined the more than two million people who went to welcome the leader at Ezeiza Airport in Buenos Aires. Once there, the tension between the left and right wing of the Peronist party erupted into
open violence. The first shootings came from the right wing of the party, and Perón immediately distanced himself from the Left. Right-wing Peronists began accusing the left wing of the party of promoting homosexuality. The FLH was partly responsible for this. Although the group of activists who went to Ezeiza Airport was barely noticeable in the large demonstration, Perlongher and others were interviewed by Así, one of the most widely read magazines of the period. Right-wing Peronists used this public appearance to claim that all the young activists from the Left were falling under the influence of homosexuality. As a result, left-wing Peronists refused to engage in any alliance with the FLH. This was quite problematic for the FLH because left-wing Peronists were the largest political group with whom they had sought to ally.

Other attempts to relate to left-wing parties also failed, and the FLH shifted its agenda from one of alliance with those parties to one focused on grassroots work within the broader homosexual community. The members of the FLH started to attend a few of the first emerging discos where homosexual men gathered at the time. Activists would approach other homosexual men and try to persuade them to organize against police persecution, telling them about the efforts of other gay liberation movements at the international level. The publication of the magazine Somos (We are) between December 1973 and January 1976 was part of this attempt. Shifting away from the previous politics of alliance with left-wing groups, Somos emphasized performative politics. The marica, or effeminate homosexual, was presented as a subject that could subvert capitalist society as it existed.

Dissolution

After Perón’s death in 1974, his third wife, Maríá Estela Martínez Cartas de Perón (1931–), popularly known as “Isabelita,” became the new president of Argentina. Under her rule, between 1974 and 1976, the political situation deteriorated. In collusion with such officials as José López Rega, she funded paramilitary groups that began killing thousands of left-wing activists, union and student organizers, journalists, and even politicians. For the FLH, it became increasingly difficult to even meet. Although they managed to undertake some activities through 1974, by late 1975 the group was effectively dissolving. By the time the military staged a coup d’état in March 1976, the FLH had, for all practical purposes, disappeared. In order to avoid persecution, several activists escaped the country. Anabitarte became an exile in Spain, where he still lived as of 2018, and Perlongher eventually went to Brazil, where he continued his academic studies and published a study of male prostitution. Although the experience of the FLH abruptly came to an end as a result of political repression, the example of this organization would be kept in the memory of LGBT people from Argentina, and it would influence the development of other similar movements abroad, as was the case with the group Somos (We Are) in Brazil (1978–1982). The emergence of a new wave of LGBT activism in Argentina would have to wait until the return of democracy in 1983.
The FLH found it hard to accomplish any of its goals because the organization existed for only a few years and faced a hostile political environment to the point of being forced to dissolve in less than a decade. With probably no more than 100 committed members and a larger group of sympathizers who circulated in and out of the organization, the FLH became renowned among the homosexual subculture of Buenos Aires of that time. The FLH has the merit of being the first attempt, in the midst of adversity, at organizing a group devoted to radical sexual politics in Latin America.

Friendship societies were associations of gay men (and less commonly lesbians) that proliferated across Europe at a grassroots level in the early twentieth century. Although they went by different names, they were all in essence social clubs that organized conversational meetings, dinners, parties, and celebrations. As the historian Andreas Sternweiler put it, they were dedicated to fostering a “feeling of community [Gemeinschaftsgefühl] ... that enabled a gay sense of self” (1997, 97; translation by Clayton J. Whisnant).

Although a few such clubs seem to have emerged in large cities such as Berlin prior to World War I (1914–1918), the number of friendship societies exploded during the 1920s and 1930s. By 1925, there were two rival organizations of friendship clubs in Germany: the Deutsche Freundschafts-Verband (DFV; German Friendship Alliance) and the Bund für Menschenrecht (BfM; Federation for Human Rights). The DFV was connected loosely with the homosexual periodical Freundschaft (Friendship) and later, after 1928, Neue Freundschaft (New friendship), while the BfM was promoted by the German publisher Friedrich Radszuweit’s (1876–1932) many newspapers and magazines, especially Das Freundschaftsblatt (The friendship paper) and Die Freundin (The girlfriend), the world’s first magazine aimed specifically at a lesbian audience.

Although the German friendship clubs were forced to shut down by the Nazis, many reappeared for a time after World War II (1939–1945) and were joined by other groups across Europe. The Swiss society known as Der Kreis (the Circle) was especially important internationally in the post-1945 era. Its journal, Der Kreis, edited by Karl Meier (1897–1974), was multilingual, publishing texts in German, French, and (after April 1954) English. It had a number of international correspondents who kept readers informed about conditions and events around the world. In Zurich, Der Kreis continued to carry on a very successful club tradition by producing skits, throwing parties and balls, hosting talks, and holding poetry readings. Amsterdam’s Cultuur en Ontspannings Centrum (COC; Culture and Recreation Center) was also vitally important. Locally, it organized social events, even opening two famous dance halls that helped to turn the city into a center for gay tourism.
beginning in the 1950s. Internationally, the COC played a critical political role by establishing, in 1952, the International Committee for Sexual Equality (ICSE), which made contact with individuals and organizations around the world and arranged international conferences.

In France the most important friendship society was Arcadie, led by André Baudry (1922–2018). Beginning his many years of activism as a correspondent for Der Kreis and as the French delegate for the ICSE, Baudry went on to found the journal Arcadie in January 1954. By 1957, Arcadie’s network of friends, readers, and contributors had gotten large enough that Baudry was able to rent a clubroom for his society. The society offered cultural events such as lectures, debates, poetry readings, plays, and films; above all, however, it was known for its dances, because before the end of the 1960s the society’s clubroom was the only location in the city where men could dance together safely.

From the very beginning, friendship societies were associated with a strategy aimed at winning respect and legal rights for homosexuals by emphasizing their respectability. Important leaders such as Friedrich Radszuweit, Karl Meier, and Baudry all encouraged gay men to live discreetly, avoid effeminacy, and above all refuse to engage in prostitution or other vices. This strategy caused many later activists during the 1970s and 1980s to look down on these earlier groups as conservative, timid, bourgeois, and saturated with self-hatred. Scholarly works in the twenty-first century, however, have offered a fresh perspective on the friendship societies, suggesting how important they were for offering paths toward political engagement in an era that was not particularly welcoming to homosexual politics. Julian Jackson’s detailed 2009 book on Arcadie suggests that the people involved with these groups were more diverse in terms of backgrounds and perspectives than one might guess from just reading the friendship societies’ publications. Furthermore, the groups were very much devoted to creating safe places in which men and women could develop a healthy sense of empowerment and self-worth.

The friendship societies mostly disappeared during the second half of the twentieth century. Those that had not yielded to constant legal battles during the 1950s eventually succumbed as new, more commercialized spaces for gay men and lesbians emerged from the 1960s on and as a new generation of activists demanded more radical strategies for pursuing homosexual rights during the 1970s. Only Amsterdam’s COC remained as of 2018, although it had been greatly transformed over the years by successive generations of leaders who brought in new energy, perspectives, and goals.

FTMInternational

ANDREW J. BROWN
Assistant Professor of Performance Art, Fairhaven College of Interdisciplinary Studies
Western Washington University, Bellingham

The largest and oldest organization serving female-to-male transgender communities and their allies, established in 1986.

FTMInternational (FTMI) is the largest and oldest organization serving female-to-male (FTM) transgender communities and their allies. The organization works through a network of local and regional chapters in eighteen countries that offer support groups, event planning, and awareness-raising programs, in addition to advocating for intersectional human rights (OAC, n.d.). FTMI leaders steer the entire international network toward a coalitional political platform, building connections with immigrant rights movements, labor movements, and prison abolition movements. Established in 1986, the organization holds in-person and online support groups, presents at and helps organize conferences, hosts a variety of social events, and focuses on education and referrals around legal and health concerns specific to FTM individuals and their allies. FTMI publishes a monthly newsletter, the *FTMI Yellow Pages* (a resource directory for FTM services), and an educational CD that narrates the story of a trans man’s transition.

While activism and support for male-to-female people, or trans women, began to emerge in the 1960s, activism focused specifically on the experiences and needs of female-to-male people, or trans men, only began to take shape in the 1980s, in large part due to the work of FTMI. The organization was founded by Lou Sullivan (1951–1991), a gay-identified FTM author and activist based in San Francisco who was inspired by some of the vanguard of FTM activism, such as Rupert Raj, Jude Patton, Steve Dain, and Mario Martino.

FTMI quickly grew from a support group to a more outwardly active advocacy group, and the organization began publishing a regular newsletter in 1987. Sullivan played a considerable role in urging medical and psychiatric professionals to offer services to transgender people who, in addition to their preferred gender roles, identified as gay or lesbian, like himself. This work had a lasting impact on present-day understandings of gender identity and sexual orientation as related but separate aspects of human experience and identity. Sullivan, who passed away at the age of thirty-nine in 1991, was also an important historian of transgenderism, with an emphasis on community-driven memory and history projects. With leadership handed over to Jamison Green, the organization began holding monthly meetings in 1991, and in 1994 added the word *International* to the
name as the organization grew toward a global reach (Stryker 2004). After Green, other presidents include Drago Renteria, Dion Manley, and Zion Free Johnson.

The FTMI president as of 2018, Rabbi Levi Alter, focused his individual efforts and influenced the organization more broadly toward addressing access to health care and hormone replacement therapy for incarcerated trans people, as well as bridging gaps between religious communities and organizations and transgender communities, individuals, and rights. Alter founded the FTMI Trans Health Clinic for Southern California in Los Angeles. Along with the organization’s initiatives at large, he worked to raise awareness about transgender experiences through media appearances. In 2005 the Trans Unity Pride awarded Alter the Icon Award for lifetime service to the FTM community.

FTMI invites individuals to found their own chapters and offers support in establishing the logistics of participation, emphasizing the benefits of team building and networked support at the local and international levels. “Allies, friends, loved ones, and tribe” who are not FTM are invited to join the FTMI AFLOAT online community, which hosts moderated conversations. In an attempt to embed trans history at the local and community level, individual chapters are often named after historic transgender figures, such as the Charlie Parkhurst Chapter in Sacramento, California; the Reed Erickson Chapter in San Buenaventura, California; the Dr. Alan L. Hart Chapter in Albuquerque, New Mexico; the Dr. M. Edwards Walker Chapter in Cincinnati, Ohio; and many more across the United States. The organization also sponsors the FTM+ Coming Out Group, led by board member the Reverend Alexander Yoo.

## LOU SULLIVAN (1951–1991)

Louis Graydon Sullivan was born 16 June 1951, and assigned female at birth. He was the third of six children in a white middle-class family and grew up in a suburb of Milwaukee, Wisconsin. As an adolescent Sullivan dreamt of being a writer or a social worker for “lost boys.” He also began having gay fantasies and both wanted men and to be one himself.

Sullivan's social consciousness developed while he was a teenager, first through the civil rights movement and later the 1960s counterculture. In his early twenties Sullivan joined the gay liberation movement. He was active in Milwaukee's Gay People's Union (GPU) where he learned how to mentor, network, organize meetings, research, and publish a newsletter. At the time, gay female-to-male transsexuals supposedly did not exist, so Sullivan identified as a female transvestite, or crossdresser.

In 1975 Sullivan moved to San Francisco where he joined the transvestite organization Golden Gate Girls/Guys (GGG/G) and soon became its treasurer and newsletter editor.
In 1980 Sullivan began volunteering with the Janus Information Facility where he answered letters from and about female-to-males (FTMs) and published Information for the Female-to-Male Crossdresser and Transsexual. This booklet was so well received by FTMs and health-care providers specializing in their treatment that Sullivan published a second edition in 1985 and a third in 1990, both with updated and expanded information. In 1990 Sullivan also published From Female to Male: The Life of Jack Bee Garland, the biography of a gay FTM journalist, social worker, and veteran of the Philippine-American War (1899–1902). Sullivan’s research into Garland led him to become a founding member of the GLBT Historical Society, where he published the newsletter and served on the Archives Committee.

On 6 December 1986, Sullivan held the first meeting of what would become FTMInternational. Everyone was welcome regardless of where they fell on the transmasculine spectrum or whom they loved. Through get-togethers, a newsletter, and tireless networking, Sullivan organized individuals around the world into an FTM community.

Tragically, the birth of FTMInternational coincided with Sullivan’s AIDS diagnosis, which he received at the end of 1986. It had taken over a decade for Sullivan to access all the services he needed to physically transition because health-care providers would not acknowledge the existence of gay FTMs. He feared other gay FTMs being similarly denied. Sullivan embraced being the first female-to-male living with AIDS and went from being mute to holding a megaphone. Now Sullivan compelled audiences to broaden their understanding of gender identity to include all sexual orientations.

Sullivan died on 2 March 1991, at the age of thirty-nine. At the end of his life, Sullivan’s peers credited him with fostering the trans movement. That movement would gain great momentum in the years following his death and would burst into the mainstream a generation later. The trans movement as we know it today would not exist without Lou Sullivan.

The FTM International Legal Resources program offers each new member the “No More Billy Tipton” Durable Power of Attorney for Health Care form that enables members to appoint health-care advocates in a move toward ensuring correct name and pronoun usage, appropriate roommate assignment, and confidentiality of private medical information. FTMI also sponsors the Transgender Law Center and offers online resources regarding applications for asylum, name change and gender marker changes on federal documents, family law, employment, and interactions with police. Many legal resources offered are available in English and Spanish and respond to locally specific contexts.

The FTMI Healthcare Resources program provides all members with prescription discount cards that can be used at local pharmacies throughout the United States, providing a discount for those who purchase testosterone without a prescription. In Los Angeles, FTMI sponsors a weekly community clinic that offers respectful care at sliding-scale prices, accepts a wide range of insurance plans, and does not require referral letters or documentation. In addition, FTMI Healthcare sponsors workshops, seminars, and support groups and acts as a community partner for conferences, especially the Philadelphia Transgender Health Conference. President Alter regularly advises medical schools and medical conferences, and the Reverend Yoo teaches classes at psychology schools and presents workshops for therapists. FTMI member Dr. R. Nick Gorton cowrote and published a free manual, Medical Therapy and Health Maintenance for Transgender Men (2005). Former president Green serves as a committee chair of the World Professional Association for Transgender Health. The organization and its website also offer medical information for FTM children and teens. FTMI's archives from 1985 to 2005, inclusive of conference materials, the quarterly newsletter, social events materials, art, artifacts, correspondence, photographs, posters, and financial records, are held at the Gay, Lesbian, Bisexual, Transgender Historical Society in San Francisco.

Gangs and Street Kids in Africa

IRVIN KINNES
Research Associate, Centre of Criminology
University of Cape Town, South Africa

MARC EPPRECHT
Professor, Department of Global Development Studies
Queen’s University, Canada

The emergence and practices of homosexual gangs and street-connected cultures, as well as their relationship with new forms of homophobia and/or occult beliefs.

Gangs in Africa are a natural outgrowth from the homosocial age groups or secret societies that were widespread throughout the continent in precolonial times. These had a socially cohesive intent in societies that often lacked formal or central political structures, in particular by bonding a generation of young men in a common purpose, such as defending the community, or by exercising behind-the-scenes power to control socially disruptive factors, such as witchcraft or the excessive display of individual wealth. Under colonialism, apartheid capitalism, and rapid, demographically skewed urbanization, gangs emerged as a familiar form adapted to survival for many African men. These gangs typically originated as groups of homeboys, or young men from the same rural area, clan, or tribe uprooted to the burgeoning cities. They banded together to defend themselves against historic or new rivals for jobs and women. Indeed, with men sometimes outnumbering women by tens or even hundreds to one in some early colonial cities and labor camps, competition among men for women could be intense and violent. An element of “social banditry” also characterized some early gangs as traditional structures of governance collapsed or were coopted by the colonial regimes. To the founder of the most feared gang in early twentieth-century Johannesburg, Mzuzepli Mathebula (locally known as Nongoloza), it was his desire for justice that first drove him to violence (van Onselen 1982, 2008).

The Numbers Gangs

Mathebula’s gang was originally called the Ninevites, after the notorious sinners of the Bible, and were so named because of their fearless contempt not just for the law but for the most basic social norms of African society. Powerfully symbolic of this was their adoption of hierarchical homosexual relations among themselves and homosexual rape as a means of terror against enemies. Their jailers during the apartheid era reputedly exploited this by
turning a blind eye or by directly exposing political prisoners to the sexual terrorism of the gangs. Something of this subculture then survived through to the present in the so-called numbers gangs, the 28s being the most infamous. According to Sasha Gear and Kindiza Ngubeni (2002), Gear (2005 and 2007) and Heather Parker Lewis (2006), the rituals of the 28s include colorful and highly symbolic initiation rites for young men recruited into the gang: “All new recruits are ... raped by ranking officers on entry into the gang.... All men now begin their career as probationers, from sexual service providers and enter the cave to be sodomised by senior gang members” (Lewis 2006, 75).

Since the establishment of the 28s, there have been breakaways from the gang such as the 27 and 26 gangs. There are important cultural and ritual differences between the prison gangs, but they are all characterized by a reliance on strong group rules and discipline. Violation of strict rituals can result in death. As demonstrated in the work of Jonny Steinberg (2004), for example, it was just not anyone in the gang who could rape other members of the gang. A war was started among the 28s in Victor Verster Prison in South Africa because “soldiers” (lowest rank) of the gang were raping “privates” (next rank up), an inversion of the proper hierarchy (Steinberg 2004, 216). The established prison gangs also frown on occult practices because they bring dishonor to the established rules of the gang.

**Sexual and Gender Roles in Prison**

Importantly, the 28s do not consider themselves to be homosexual, despite engaging in such acts. Because of the macho culture inside South African prisons, any man’s public identification as being gay would invite rape by other prisoners. Even an implicit admission through an act of mutuality could be interpreted as evidence of homosexuality. Yet long-term, relatively stable relationships could develop within the gang system. These were closely modeled on the hierarchies of traditional gender roles, the man or husband being the inserter and provider of protection and gifts, and the “woman” or “wife” being the insertee, the protected, and the recipient of gifts. Similar gang structures and gender dynamics have been described in female prisons (Chetty 1995; Schreiner 1992).

There may be cause to doubt how rigidly sexual and gender role discipline was maintained in the prison system. Based on Zackie Achmat’s 1993 account of his erotic night as a young gay anti-apartheid activist in prison, for example, even hardened gangsters may have been open to experimentation in their cells. It is also important to note that the old strict delineations of the established gangs have started to crumble, and the cultural practices and rituals have lost much of their dominance in the age of globalization and the new technological revolution (Pinnock 2016; Pinnock and Douglas-Hamilton 1997). The prison gangs have, in fact, lost much of their power and the space they controlled inside prison as a result of more resources being made available by the authorities and by policies to protect the dignity and human rights of prisoners. Since the late 1990s, prison gangs have
thus been largely eclipsed by organized, armed street gangs.

Street Gangs and Violence against LGBTI Individuals

Street gangs have shifted the nature of criminality. For example, since the late 1990s there have been numerous attacks on albinos in different African countries, mainly for body parts that are used as “medicine” (Burke, Kaijage, and John-Langba 2014). The body parts are made into a paste by traditional healers and mixed with herbs and plant roots, which is then smeared on the body to heal people or provide a protective shield against ill fortune. This type of attack is often a transnational crime that can be organized only by people who have usurped the power and honor code that prison gangs formerly exercised.

Attacks on LGBTI individuals have also been increasing in South African townships. Incidences of reported corrective rapes of lesbians (assaults intended to “cure” women of their lesbianism) have been on the rise, with one support group in Cape Town encountering an average of ten new cases each week in 2009 (Strudwick 2014). The violence of such assaults is also increasing; according to a 2015 article by René Koraan and Allison Geduld, there had been thirty-one murders linked to such cases in the previous fifteen years. The common feature of media reports of attacks on lesbians in the townships of the country is that the victims were gang-raped. The men in such cases commonly justified themselves with reference to the political homophobia espoused by leaders who construct homosexuality as a threat to the nation coming from the West. In Tanzania, for example, the police and militia groups such as the Sunga Sunga vigilante group have been at the forefront of attacks against LGBTI community members, according to a 2013 Human Rights Watch report written by Neela Ghoshal. That report tells of the levels of violence meted out to homosexual men and women who use drugs, who are systematically refused treatment when they are gang-raped and are then humiliated, tortured, and also gang-raped by the police. The covert use of gangs or youth militia by the state to carry out political violence has also been attested to in Nigeria, Kenya, and Zimbabwe (Baker 2002; Ruteere 2008; Chitsike 2013), a deeply worrisome development when the fight against homosexuality becomes an issue of patriotism.

Street-connected children are a further phenomenon associated both with the collapse of the traditional extended family under neoliberal economic conditions and with same-sex practices. For many reduced to living on the street, selling sex is a means of survival that does not allow the sellers to refuse buyers, whether the latter are men seeking boys for sex or men wishing not to wear a condom. Same-sex relations have also been observed to develop among boys living on the streets in Tanzanian cities. The kunyenga practice there refers to a street sexual encounter between boys that involves nonmutual anal penetration (Lockhart 2002). As in the old prison etiquette, homosexuality and mutuality are strictly denied, and as the boys mature, they first become “men” over other boys and then men in heterosexual relationships. The implications for the struggle against HIV, and for the
attainment of human rights for sexual minorities, are serious and thus far underresearched.

BIBLIOGRAPHY

Lewis, Heather Parker. God's Gangsters? The History, Language, Rituals, Secrets, and Myths of

Launched in 2011, the Gay European Tourism Association (GETA) had almost 5,000 members by the end of 2017. Membership is open to any travel-related business operating in Europe, or that promotes tourism to Europe, and that welcomes gay, lesbian, bisexual, and transgendered customers. The use of *gay* in GETA’s name is meant to include all nonheteronormative sexualities. GETA aims to promote LGBT tourism to, and within, Europe and is predominantly an online, business-to-business organization, providing resources and advice for businesses wanting to engage with what it considers to be the multibillion-euro LGBT travel market. To that end, GETA provides marketing advice, access to marketing research, an archive of articles that have been published on LGBT tourism in the LGBT press, and more specifically tailored information for individual businesses.

A significant focus of the association is its Innovation Programme, which aims to encourage, support, and facilitate innovation in LGBT tourism in Europe. GETA has partnered with a range of other organizations, such as the European Travel Commission, to provide guidance for travel professionals wishing to serve the LGBT market and, in partnership with the global public relations firm Grayling, launched a multinational communications service for its members in 2014. GETA also operates another website, Gay Welcome, which provides a range of information for prospective LGBT travelers about destinations, accommodation, cruises, and tours within Europe. The website includes a very comprehensive gay media directory, which includes an archive of articles, features, and shorter stories about aspects of gay travel that have previously been published in LGBT magazines such as the *Advocate*, *Gay UK*, and *LOTL*.

The incentive to establish the organization came from its executive director, Carlos Kytka, who, while acknowledging the role that the International Gay and Lesbian Travel Association (IGLTA) played at a global level, felt there was a need for an LGBT travel business organization that focused exclusively on Europe, as he explained in personal communication with Kevin Markwell in 2017. Kytka and three other business partners established the organization, with the three partners taking on voluntary directorships for development, operations, and communication. In addition, GETA comprises a number of
“patrons,” or people with experience in aspects of LGBT tourism who provide an additional source of knowledge and expertise from which members draw.

GETA is a membership-based organization in which the first level of membership is free, while the upgraded membership is 100 euros per year. Upgraded membership provides access to a wider range of resources such as marketing tools and expertise and findings from market research undertaken by GETA. For example, an analysis undertaken by GETA in 2012 estimated that the LGBT travel market in Europe was worth between $61 billion and $75 billion.

LGBT rights organizations and scholars have often been skeptical about the political and social value of focusing so much on the economic significance of the LGBT market. There has been considerable criticism of the commercialization of LGBT cultures, in which LGBT people are viewed simply as consumers rather than as subjects or citizens (Gluckman and Reed 1997), and the phenomenon of “pinkwashing,” in which businesses appear to be LGBT friendly simply to gain market share (Guaracino 2007). However, studies such as the aforementioned one published by GETA in 2012 that demonstrate the economic value of LGBT tourism can be used to persuade national governments to take LGBT tourism seriously and provide resources to promote destinations as “LGBT friendly.” Such a reputation, however, does not necessarily translate into a safer, more inclusive town or city for LGBT residents.

While GETA sees itself as not taking a political stance, as noted by Kytka in his 2017 communication with Markwell, it does provide travel advice for gay tourists, emphasizing on its website that an array of legislation regarding homosexuality exists across Europe as does an equally diverse array of attitudes toward homosexuality (GETA 2017). Such information, framed around providing information for prospective tourists, nevertheless maps out the politics of LGBT citizenship in Europe. The association has also issued news releases calling for the International Olympic Committee to affirm its support for LGBTI rights at the Sochi Winter Olympics and for the European Union to suspend talks on visa-free travel for Russian officials as a response to the antigay legislation introduced in Russia in 2013 (GETA 2013).

The extent to which an organization such as GETA, with its mission entwined so much with the “pink dollar,” can contribute to the promotion of LGBT rights and citizenship will continue to be debated. Indeed, such debates about tourism’s role in creating positive social, environmental, and economic outcomes permeate tourism scholarship. GETA, however, is an example of a regional, private-sector tourism organization (Gee and Fayos-Solá 1997) that aims to serve the specific interests of its membership. Industry-based organizations such as the IGLTA (established in 1983) and GETA play significant roles in the structuring and organization of the LGBT travel industry, helping to raise the profile of LGBT tourism, enhancing professional and industry credibility, and increasing
opportunities for communication and professional development among their members (Waitt and Markwell 2006).

The Gay International and Mideast LGBTQI Organizations

JEDIDIAH ANDERSON
Visiting Assistant Professor of Arabic
Furman University, Greenville, SC

The critique by Columbia University professor Joseph A. Massad of LGBTQI rights organizations in the Middle East as agents of Western organizations in support of a greater colonialist strategy.

In the fields of gender and sexuality studies, the question of how and if homosexuality is enacted and understood as an identity is still fiercely discussed. The roots of this discussion are in the debate about essentialism, which argues that certain features of identity are innate, or essential to the person, versus social constructionism, which argues that all facets of human identity are products of the society in which people live. The topic of essentialism versus social constructionism vis-à-vis homosexuality is particularly heavily discussed both in the Arab world and regarding it, because of repressive laws against homosexual activities in most of the Middle East, the history of portrayals of same-sex desire in the Arab world in particular, and Orientalist fascination with the topic.

In the premodern Arab world, homosexuality was frequently seen as something that one did, not something that one was, as such scholars as Khaled El-Rouayheb, Dror Ze’evi, and Joseph A. Massad have claimed. While homosexuality was considered a sinful act in Islam, it was considered an act that anyone was capable of. Modern Western concepts of homophobia and gay rights would thus not translate well into the premodern context. However, as the Arab world came into closer and more frequent contact with the West in the context of colonialism, Western concepts of both homosexuality as an identity and of this identity being a “deviant” identity began to take hold in the Arab world. With this systemic oppression of homosexuality that accepted homosexuality as a category of identity a priori, those who were identified as homosexual in this hermeneutic began to agitate against this discrimination that they faced. Starting in the twenty-first century, LGBTQI activists in the Arab world, particularly in Lebanon, began to organize in order to advocate for their civil rights in the organizations Helem (2004 to the present; evolved out of forerunners Club Free and Huriyyat Khassa), Meem (2007 to approximately 2014; now existing solely as a support group), alQaws (2001 to the present), and Aswat (2002 to the present).

Massad, Foucault, Incitement to Discourse, and the “Gay
Because homophobic discourses and structures that activists in the Arab world were agitating against were Western in origin, as was the identity of “homosexual” itself, Columbia University professor Joseph A. Massad critiqued this activism in his book Desiring Arabs (2007). In it, he claimed that these activists were engaged in what the French philosopher Michel Foucault termed in his book The History of Sexuality, Volume 1: An Introduction, as “incitement to discourse” (Foucault 1978, 17)—that is, generating discourse about same-sex desire in the Arab world in order to control how it is understood in the region. In terms of the history of this, Massad (2007) claimed that this “incitement to discourse” had both intentionally and unconsciously taken place in the Arab world since the 1800s, beginning with the censorship of representations of same-sex desire in the Arab world in the poetry of Abū Nuwās (c. 756–c. 814 CE), a famous classical Arabic poet who wrote extensively on homoerotic themes, and continuing to the present day.

Within this context, Massad accuses those who work in LGBTQI activism in the Arab world of belonging to something he calls the “Gay International”—that is, a collection of Western and Western-funded gay rights organizations that work in the Arab world and have sought through this incitement to discourse to define sexuality in the Arab world solely in Western terms, thus allowing it to better be controlled. Massad also argues that this incitement to discourse on the part of the “Gay International” serves to maintain the hegemony of the West over the Arab world, as a part of the discourses of colonialism and Orientalism. It serves as an attempt to produce knowledge that allows the West to subjugate the Arab world and that both “others” the Arab world to its own sexuality and “others” the Arab world to the West. This othering of same-sex desire in the Arab world has been for the purpose of creating shame and anxiety in the Arab world about its sexuality in order for the Arab world to be more easily exploited by the West. The forms of this imposition have had major political implications, according to Massad. The hegemonic aspirations of the West through this incitement to discourse, he claims, can be seen in the interrogation methods used by the United States on detainees in Iraq (including, but not limited to, the sexual torture used in the Abu Ghraib prison) and in forms of sexual cruelty and torture used by Israeli soldiers on Palestinians.

The “Gay International” and Homonationalism

In her book Terrorist Assemblages, Jasbir K. Puar makes a similar observation to Massad regarding Abu Ghraib, claiming that the sexual abuse of the Iraqi detainees in that prison was based on the Orientalist construction of Arabs simultaneously as “monster-terrorist-fags” and as sexually repressed (2007, 46). Through the deployment of homonationalist discourse, Puar and Massad argue, Western gay rights discourses serve a hegemonic purpose in the Arab world. Their foci, however, are completely different. Puar focuses on
how homonationalist discourse has shaped the concept of LGBTQI rights in the West and has positioned the West as sexually “more modern” than the Global South. Massad, however, looks at how this discourse has shaped both the political identities of Arab LGBTQI activists and the sexual identities of Arabs that experience same-sex desire. He claims that what happened in the Arab world as a result of this incitement to discourse was the creation of “gay people” and, through that, the creation of “straight people” who could then oppress “gay people” (Massad 2007, 188–189). Furthermore, he claims that the imposition of this new paradigm was epistemically violent, resulting in the politicization of “gay people,” who were unprepared and unwilling to engage in the assertion of their identity—an identity that they did not claim, and that Massad claims was thrust on them in an epistemically violent manner by this discourse. This is not to be understood as an “outing” of LGBTQI people in the Middle East, according to Massad, but instead as a situation in which, “by inciting discourse about homosexuals where none existed before, the Gay International is in fact heterosexualizing a world that is being forced to be fixed by a Western binary” (Massad 2007, 188). As a result of this, Massad argues that phenomena such as the Stonewall riots that took place in the New York City in 1969 have not been seen in the Arab world. Instead, activists acting on behalf of the “Gay International” are disingenuously arguing for gay rights in order to reify the hetero/homo binary.

The Gay International and Erasure of Women

In her 2009 article “Medieval Arab Lesbians and Lesbian-Like Women,” Sahar Amer, like Massad, observes that categories of sexuality in the Arab world do not necessarily match perfectly with sexual categories in the West. Amer mentions the wide range of words that were used to describe various configurations of same-sex desire and also observes that “no medieval Arabic word existed for the sort of bisexuality that was considered as the unmarked, most common form of sexual practice, for heterosexuality, or even for sexuality” (2009, 224). Jins, the modern Arabic word for sex, acquired that meaning only as a result of “Arabic translations of [Sigmund] Freud in the 1950s and of Michel Foucault’s History of Sexuality in the 1990s.” She also observes that it is this same period in which Arabic terms for “homosexuality” and “heterosexuality” were also coined (224).

However, Amer, unlike Massad, observes, in addition, that the Westernization of norms of same-sex desire in the Arab world has also resulted in the erasure of both gender as a category of analysis and of women as a subject. Writing about “lesbian-like” women (borrowing the term from the historian Judith M. Bennett) and their representations, Amer (2009) describes her encounters with censorship of the works that she was studying and the difficulties that this censorship posed. She shows how this censorship has served to erase women and gender from the discussion of the internationalization of gayness in the Arab world by concluding with an unusual instance of censorship through capitalism, in which can be seen the triple articulations of patriarchy, homophobia, and emphasis on men
in Orientalist homoerotic discourse:

The only English translation of al-Tifāshī's Nuzhat al-albāb is called The Delight of Hearts and was translated by Edward A. Lacey from a French translation by René Khawam rather than from the Arabic original. The translation has ended up ghettoizing this important Arabic text. Even though it is almost certain that this medieval Arabic work was addressed to a much wider audience, its contemporary English translation is published by an exclusively all gay [male] press called the Gay Sunshine Press and thus has a limited circulation and is likely to be known primarily to a gay audience. Moreover, Lacey has taken the liberty to excise from his work the chapter on lesbianism as well as other sections dealing with heterosexuality because of budgetary concerns and press policy, which dictates that Gay Sunshine Press address exclusively male gay literature. The manipulations that Nuzhat alalbāb has thus undergone have transformed this important text almost beyond recognition. Not only has this English translation utterly erased those lesbian voices that were audible in the medieval Arabic tradition, but it has also categorized sexuality in ways that were certainly not present in the medieval text. Translating only the sections on gay men's sexuality has imposed a modern and Western perspective onto the medieval Arabic work that places sexual desires and behaviors much more on a continuum.

(235)

This incident provides an excellent example of the concerns expressed by Massad about the role of the "Gay International" in the manipulation of previous constructions of same-sex desire in the Arab world. By analyzing Nuzhat al-albāb from an exclusively Western, gay male perspective, conflating both androcentrism and cultural relativism, the experiences of women and understandings of heterosexual sexuality in the Arab world discussed in that work are erased, and one particular frame of experience is privileged instead. One can also see the role of global patriarchy in the erasure of gender from the entire discussion altogether, as female same-sex desire in the premodern Arab world is rarely spoken of in academic literature that problematizes same-sex desire in the modern Arab world. This silence on the part of the academy is puzzling indeed, as Amer (along with the scholar Samar Habib) convincingly documents “the survival of a noteworthy body of primary texts dealing precisely with this topic” (2009, 215).

LGBTQI Activism in the Arab World and “The Gay
Massad has stated in writings and interviews that groups such as Helem and alQaws are modern examples of incitement to discourse about homosexuality in the Arab world (Massad 2015), and that they, by creating “gay people,” serve to oppress the same groups that they are attempting to protect by simultaneously creating “straight people” (Massad 2007, 188–189). He further argues that these activist groups are colluding with Western LGBTQI rights organizations for the express purpose of reifying same-sex desire as a “gay” identity, and that thus it can be argued that groups such as Helem and alQaws work in an epistemically violent manner to impose both Western hegemony and Western sexual norms on the Arab world.

In providing evidence to support his argument, Massad (2009b) claims that Helem is a small unrepresentative minority in the Arab world that argues for LGBTQI rights in the region, likening its members to “racist white women who through US imperialism want to defend the women of Afghanistan or who want to define the nature of the difficulties faced by women in different non-US and non-European societies in accordance with the priorities of their segment of the white women’s movement.” He further attacks the Palestinian LGBTQI activist group alQaws as being an “Israeli-based” organization, claiming that it cannot speak authentically on behalf of normative Arabs with same-sex desires (Massad 2015), and argues that Helem receives “funds from the same American military industrial complex that funds the Ford Foundation” and that its connection to other organizations that fund it, such as the Astraea Lesbian Foundation for Justice and the Heartland Alliance, show that Helem is fully complicit with the aims of the “Gay International.” In making this argument, Massad (2009a) cites the website of the Heartland Alliance, quoting its explicit mission as follows:

*Develop a grassroots global network focused on protection of LGBT populations in danger; Build local capacity in regions where LGBT rights are hampered by political, social, and religious opposition; Establish several anchor institutions to build regional networks and serve as regional resource centers; Provide a forum for learning and capacity development to build LGBT civil society from the ground up.*

Through his writing in *Desiring Arabs*, Massad clearly believes that this “capacity building” is a form of epistemic violence perpetrated by the Heartland Alliance and other organizations that focus on LGBTQI rights in developing countries. It is important, however, to look at the responses of some of these organizations to this particular criticism of international LGBTQI rights activism, whether they directly name Massad or not.
LGBTQI Responses to Massad’s Critique

Perhaps the most notable and direct response to Massad’s critique of LGBTQI rights organizations that work in the Arab world came from former Helem executive director Ghassan Makarem, in his response to Massad’s interview (2009b) with Ernesto Pagano in *Reset DOC* magazine titled “The West and the Orientalism of Sexuality.” In this response, titled “We Are Not Agents of the West,” Makarem (2009) argues that “it is odd that Massad, a Palestinian in the Diaspora, refuses to recognize the agency of persons with non-conforming sexual orientations in ‘the East’ and their ‘right’ to seek social community and choose identities.” He further claims that factors such as the urbanization of the Middle East as a result of capitalist modes of production have led to the formation of new identities in the Arab world, and that Massad’s argument is something that he has heard before from “Salafists and chauvinists,” further arguing that

> the contention that homosexuals are agents of the West, that they are “imposing Western values,” and that they belong to the upper classes was also used by [the Iranian leader Ayatollah Ruhollah] Khomeini before rounding up homosexuals and executing them. It is the same justification given to call for the arrest of HIV positive persons in Egypt and elsewhere and to pass a viciously homophobic law in Uganda.

While Massad has not been consistently named explicitly in responses to this particular critique by LGBTQI rights organizations that deal with the developing world, his criticism, it can be argued, has resulted in it becoming necessary for each of these organizations to address it on one level or another. One example of this can be seen on the website of the international LGBTQI rights organization OutRight Action International. The group articulates that its goals are not necessarily to create a new “gay international identity” but instead to work within the identity framework of the countries in which the group operates, saying that, instead of establishing and supporting “a grassroots global network”

> four critical goals shape our work: We advocate for the elimination of discriminatory laws, policies and practices, such as sodomy laws which empower police and other authorities to abuse, harass, extort, imprison and execute us. We support the enactment and implementation of anti-discrimination laws, policies and practices to help build a world that is more equitable and fair. We strive to reduce family, community and state-sanctioned violence, publicly condemning all forms of violence against individuals because
of their sexual orientation, gender identity or gender expression. And we
actively promote economic, social and cultural rights, such as those related to
employment, housing, education and health.

(OUTRIGHT ACTION 2018; EMPHASIS IN THE ORIGINAL)

Later on the same web page, OutRight Action makes its opposition to the "Gay
International," as Massad describes it, even more explicit, saying that

we bring a fluid understanding of identity to our work. We support people who
experience violations to their rights on the basis of their actual or perceived
sexual orientation, gender identity or gender expression. This means that we
work with those self-identifying as lesbian, gay, bisexual, transgender or
intersex (LGBTI) and with those whose identities do not fit the LGBTI paradigm,
such as those who call themselves tongzhi or hijra.

(EMPHASIS IN THE ORIGINAL)

While one can easily argue that this is merely paying lip service to the issues that have been
raised by Massad, or that this is simply putting new words to the same strategy that
Heartland Alliance uses, it is important to observe that Massad’s problematization of global
gay identity has shifted the discourse on LGBTQI rights in the Arab world to the point
where these issues and questions must be explicitly answered and addressed by
nongovernmental organizations that deal with LGBTQI rights in the region.

As a result of colonialism, the Arab world has gone through a long period of examinations
of the question of modernity that stretches all the way back to the 1800s. This crisis of
modernity and the civilizational anxiety (to use Massad’s term) that it has produced have
also extended to sexuality, and particularly homosexuality, in the Arab world. Differing
epistemologies of same-sex desire in the Arab world from those of the West have resulted
in Orientalizing discourses constructing Arabs as “polymorphously perverse” and
backward in their sexual desires. These differing epistemologies have also led to a silencing
of homoerotic literature and discourse from the premodern Arab world, as well as to a
higher degree of oppression than existed previously for people who acted on their desires
for members of the same sex.

With this increase in oppression of people who acted on their desires for those of the same
sex came organization on the part of the oppressed in order to advocate for their rights. As
a result of globalization and colonialism, these oppressed people began to assemble under Western labels for same-sex desire, such as “gay” or “lesbian,” and to work with organizations abroad that used those same labels and that were sympathetic to their goals. This relationship between local activists in the Arab world and global organizations based in the West is how these global organizations came to become what Massad termed the “Gay International.”

This concept of the “Gay International” (whether or not organizations in the West actually operate in this manner) has resulted in global LGBTQI rights organizations feeling it necessary to address the claim that they are imposing their Western sexual framework on the developing world in some manner in their research and activism, while also possibly leading to an erasure of the relevance of gender in analyses of sexual identity and activism in the Middle East and North Africa region. Additionally, it has opened the question of sexual identity vis-à-vis colonialism and has played a crucial role in reexamining the history of sexual frameworks in the West, the Arab world, and elsewhere.

OutRight Action International. “What We Do.” https://www.outrightinternational.org/content/what-we-do

The Gay Latino Alliance (GALA), a San Francisco–based gay Latino organization, was the first gay Latino association to attain nationwide visibility in the United States. GALA offered a safe forum for its Latino gay members, who experienced racism in San Francisco's white gay communities and homophobia in Latino communities. Its leaders organized social events and participated in national and international political movements during its period of activity between 1975 and 1983.

Founding the Gay Latino Alliance

In the late 1960s and early 1970s, many gay Latinos and lesbian Latinas migrated to the San Francisco Bay Area to live their sexuality freely, as many of their white counterparts did. Gay Latino newcomers could meet other Latinos in the Mission District, San Francisco's Latino neighborhood, but had to travel outside of the Mission in order to meet their white gay counterparts, who mainly resided in the Castro, San Francisco's predominantly white gay neighborhood. In a heated social and political context, these new migrants had to navigate urban discourses on race, place, immigration, gender, and sexuality. Gay Latinos encountered homophobia in their Latino home neighborhoods and racism in the mainly white gay neighborhood of the Castro. Gay Latinos and lesbian Latinas felt therefore marginalized, isolated, and discriminated against.

Rodrigo Reyes, a Latino gay male, had moved from Texas to San Francisco in 1971. Reyes knew only a few Latino gay males in the Bay Area. When, in 1975, a lover invited him to spend a few days in Los Angeles, Reyes discovered an all-Latino gay nightlife for the first time. He remembered the experience vividly in an interview with GALA historian Horacio N. Roque Ramírez:

This bar [was] full of nothing but Chicanos and Mexicans. White people [were] a very, very small minority. So for the first time in my life I [found] myself as a gay man and as a Chicano at the same place, at the same time, and all of a sudden...
all those people that I grew up with, all my ideal types, all the people that I used to have crushes with, were there, present, in this place. And for once I did not feel like a minority of any kind, not a minority as a gay man, not a minority as a Chicano. This was a place where I could be the majority. It felt wonderful. It felt incredibly wonderful.

(ROQUE RAMÍREZ 2003, 234)

Upon returning to San Francisco, Reyes decided to organize the Latino gay male population of the area. He published a classified ad in a gay newspaper, the Bay Area Reporter, that read: “Chicano and Gay? An organization is now forming in San Francisco to explore and attempt to fill the social, cultural and political needs of the Gay Chicano. Being a Gay Chicano is a unique experience only other Chicano Gays can truly understand” (quoted in Roque Ramírez 2003, 231). Reyes received twenty responses.

Manuel Hernández Valadéz, who had by then started to organize a group of gay Latino men in San Jose, was one of the individuals who responded to Reyes's ad. Hernández Valadéz had lived in the Bay Area since the late 1960s and regularly attended San Jose's and San Francisco's gay bars. His best friend, Jesús Barragán, had moved to California from Arizona in 1955 and was also a regular in the Castro's gay bars, where they had met. Their experiences were similar: they both encountered racism and discrimination in these predominantly white spaces, wanted to meet more gay Latino males, and aspired to organize politically.

In 1975 Barragán and Hernández Valadéz hosted a dinner party in Barragán’s San Jose home. Reyes, along with fifteen Latino gay men, were in attendance. While the goal of the dinner party was to define strategies to include a Latino float in the upcoming San Francisco gay parade, the party was, de facto, GALA’s founding event. As the night progressed, and more people were in attendance, the discussion shifted from the necessity of having a float in the gay parade to San Francisco’s racial and sexual politics. The Latino men in attendance decided to form an organization and to recruit more members.

In order to recruit members, Reyes, Hernández Valadéz, and Barragán posted flyers in the bars of the Castro, Polk Street, the Tenderloin, and the Mission, where Latino gay men socialized. These flyers informed gay Latinos of an upcoming meeting at the Society for Individual Rights center for a still nameless Latino gay organization. At this meeting, sixty individuals, mainly men, voted to form an official organization. Hernández Valadéz first suggested naming the organization Gay Latinos Unidos, adding the slogan “Like glue we stick together.” Reyes, however, coined the name of the organization, GALA, which he insisted on pronouncing “gay-la.”
A few lesbian Latinas attended GALA's first meeting. Diane Felix, considered one of the early female founders, was present. Originally from Stockton, California, Felix had left her hometown for the Bay Area in 1975. A San Jose resident, Felix was politically involved in the Latino community, as were many of her male peers. She had participated in protests against the Vietnam War, in the Chicano Moratorium movement, in protests against the Los Angeles Police Department's murder of the Mexican American journalist Ruben Salazar, and in solidarity movements with Chile and Cuba. Like many of GALA's founding male members, she had not been previously involved in any gay organizations.

**Negotiating Gay and Latino Identities**

While most of GALA's members were socially and politically active in Latino communities, many of them had never been involved in gay politics. The organization's main goal, therefore, was to help its members develop strategies to express gay identities in Latino communities. Although San Francisco’s Latino and gay communities occupied different spaces in the city, negotiating between these two communities was not part of GALA’s main political agenda. GALA’s members experienced racism in gay communities but also experienced homophobia in Latino communities, and they sought to gain acceptance in Latino communities first. In a 1981 article published in *Nuestro* magazine and then reprinted in the gay newspaper *Coming Up!*, in which Reyes narrated the history of the organization, he also discussed the difficulty of being gay in Latino families:

> Homosexual. The word alone elicits responses that range from nervous giggles to physical violence. For Latina lesbians and Latino gays, growing up and maintaining an existence in Latino communities has been a painful process, often endured in silence and isolation. “The love that dares not speak its name,” as the Victorians called it, dares even less to speak it en español. But even in la comunidad, times have changed. A group of gay and lesbian San Franciscans, deciding to organize for their right to a place in the community, formed GALA, The Gay Latino(a) Alliance in November of 1975.

*(REYES 1981, 3)*

Rooted in the Mission District, where most of its members socialized, GALA was defined as a Latino organization, grounded in San Francisco’s Mission District and designed to address the specific needs of gay Latinos in their home neighborhood.

In order to help its members, GALA became both a social and political organization. GALA’s leaders organized not only fund-raisers and marches but also dances and drag balls. GALA
participated mainly in mainstream Latino events, such as Cinco de Mayo festivities and Carnival festivals, but also in gay-dominated happenings, such as the Gay Freedom Day parades. Composed of several committees, the organization offered its members a wide variety of groups and boards: a social committee, a bylaws committee, a political committee, and a coordinating committee. Although only the most active members attended the political biweekly meetings, hundreds of gay Latinos and lesbian Latinas attended GALA’s social parties.

GALA managed to integrate and rally other political (predominantly heterosexual) Latino organizations by underlining the similarities between gay and Latino political struggles. By emphasizing issues around immigration, labor, violence, discrimination, and racism, which both gay Latinos and heterosexual Latinos experienced, GALA associated with many Latino organizations in the Mission. For example, El Comité Salvadoreño (the Salvadorian Committee) marched with GALA at a Gay Freedom Day parade, because GALA had supported them in a march they had organized. By sharing their means of resistance in workshops and meetings with the wider Latino community, GALA became a staple in San Francisco’s Latino political landscape. As a result of being involved in many nongay political activities, GALA was also supported by many Latino organizations in San Francisco.

At the same time, however, conflicts between GALA’s community and the mainstream white gay community were intense. Racial tensions reached a climax during the 1977 San Francisco Board of Supervisors election. For District 6, which encompassed the Mission, white gay leaders supported white lesbian Carol Ruth Silver. The San Francisco Sentinel, a gay-owned newspaper, argued that Silver best represented the interests of the Latino district. The members of GALA, however, forcefully rejected the white gay leaders’ choice and endorsed a straight Latino candidate, Gary Borvice.

As a result, the organization found little acceptance in San Francisco’s gay communities. In 1981, for example, a heated debate in Coming Up! forced GALA to denounce racism in white gay communities, in writing. Shortly after its sixth anniversary, GALA had organized a party called “Night in Havana,” based on a Cuban theme, which was criticized by white gay leaders. Tim Speck, a gay white man and Mission resident, had written a letter to Coming Up! to express his discontent. In his letter, Speck claimed that he enjoyed living in the Mission because “one of the greatest joys in my life is to walk through my neighborhood and be in the middle of such stunningly beautiful latino people, and hear their marvelous language.” Speck noted, however, that “the only problem is that I have to be back in my room before dark, when the teenagers come out with lead pipes, knives, and guns” (quoted in Roque Ramírez 2003, 248). GALA responded to the letter, noting that “[Speck’s] generalization of our youth as violent marauders is an affront to all latinos,” calling him “racist” (249). GALA’s letter also condemned Speck’s objectification of Latinos.
As a Latino group, GALA managed to integrate many of San Francisco’s Latino political organizations, mainly because of its anchorage in the Mission neighborhood. It also, however, forcefully denounced racism in gay communities, which further separated it from the Castro’s mainstream gay political agenda.

**GALA's Demise**

In the early 1980s GALA further disconnected from white gay communities and experienced growing tension between its male and female members. For many, the 1979 opening of the gay Latino bar Esta Noche in the Mission symbolized the beginning of the organization’s decline. While the opening of Esta Noche was a victory for many Latino gay men who previously did not have a Latino-owned bar in which to socialize, GALA’s leaders also started to organize meetings, dances, and fund-raisers at the bar, a space designed for gay men’s entertainment. This spatial shift forced many women to leave the organization and many men to reassess their involvement in the organization.

GALA had not originally been created to recruit women. The first meetings were male-centered. The subsequent dances and fund-raisers focused mainly on male entertainment. Some lesbian Latinas, such as Diane Felix, were involved in the organization, but women remained a minority. GALA’s male members, unaware of their own misogyny, did not embrace the specificities of lesbians’ political agendas. Barragán, for example, remembered his male peers’ lack of concern for GALA’s lesbian membership: “GALA had thrown all these dances, basically for men. And, yes, women went, but I remember the first GALA dance … some idiot shows gay porno on the walls during the dance and of course some of the women complained” (quoted in Roque Ramírez 2003, 252). Felix remembered experiencing tension since the first meetings:

> Most of the men were very welcoming, very happy. It wasn't until like later on, like the third, fourth meeting that some people had approached me and told me, “You know, I’m really sorry you came back, because I wanted to be just around Latino men, I didn’t want to be dealing with women.” I said well, too bad [laughter]. Sorry you feel that way. Once you get to know me you'll love me [laughter]. And we fought all through the eight years. I wouldn’t leave and they wouldn't leave.

(252)

Early on, Felix had insisted on adding the word *co-sexual* to GALA’s official description. It must be noted, however, that GALA did not completely ignore women’s issues; a women’s
The caucus was formed in 1976, and the name of the organization was changed from Gay Latino Alliance to Gay Latina/Latino Alliance in either 1976 or 1977.

GALA was not only a social organization that organized balls, dances, and drag shows but also a political organization that supported Latino causes in San Francisco, the nation, and around the world. Challenging heteronormativity in Latino communities and racism in gay communities, GALA remained rooted in the Latino neighborhood of the Mission. Its main founders—Barragán, Reyes, and Hernández Valadéz—created what Roque Ramírez called a "hybrid culture, in which members reformulated the meanings of both 'lesbian/gay' and 'Latina/Latino'" (2003, 258). By aggressively challenging the discourses at the intersection of race, place, gender, and sexuality, GALA was, between 1975 and 1983, a safe space for gay Latinos and lesbian Latinas to develop strategies for acceptance and resistance in both the wider gay communities and Latino communities of the San Francisco Bay Area. Like their African American counterparts, who had created their own associations away from mainstream white gay organizations, LGBT Latinos were more comfortable addressing the needs of their own community with their own political groups. The American LGBT political landscape, in the early 1980s, had become fragmented, by race, class, and gender.

BIBLIOGRAPHY

The Gay Liberation Front refers to an international network of organizations founded in New York City in 1969 following the Stonewall riots, the prominent uprising in response to police raids on a popular gay bar in Greenwich Village. Following the riots, activist Michael Brown reached out to Dick Leitsch, president of the Mattachine Society (a homophile organization working to educate the public about homosexuality with the intent of reducing discrimination in civic society and legal policies), who had recently published “The Hairpin Drop Heard around the World,” one of the best-known accounts of the event, which focused specifically on events following the first night of riots and was influential in shaping dominant narratives of the events. Together, they formed the Mattachine Action Committee, which soon branched off into the Gay Liberation Front (GLF). The formation of the GLF marked a turn in gay rights organizing from promoting inclusion to making more militant, radical demands, represented in part by the explicit reclamation of the word *gay*, which had previously been played down by existing movements.

**The GLF Manifesto**

The GLF proposed broad, sweeping social and political revolution based on the premise that all of society was oppressed by heterosexual gender norms and that a radical rethinking of self and interpersonal relations through sexual liberation could achieve structural change. While perhaps an idealistic mind-set in retrospect, this shift denoted a significant reframing of sexual politics at the time: *gay* came to mean freedom, liberation from embedded systems of oppression, rather than naming a particular identity or even a set of sexual practices. As the GLF manifesto asserts,

Gay shows the way. In some ways we are already outside the family and we have already, in part at least, rejected the “masculine” or “feminine” role society has designed for us.... Gay men don’t need to oppress women in order to fulfill their own psychosexual needs, and gay women don’t have to relate sexually to
the male oppressor, so that at this moment in time, the freest and most equal relationships are most likely to be between homosexuals.

(MANIFESTO GROUP OF GLF 1971)

The Gay Liberation Front manifesto identifies a number of means by which society is oppressed: family, school, church, the media, words, employment, the law, physical violence, psychiatry, and self-oppression. In each case, the manifesto connects individual suffering and oppression to larger structural logics of power, primarily heteropatriarchy. These connections tease out how each institution perpetuates stereotypical binaries that position male roles as oppressors and female roles as oppressed. In a section titled “WHY We’re Oppressed,” the manifesto spells out the justification for a revolutionary rather than reforming stance, pointing to the shortsighted nature of legal and social reform, which emphasizes tolerance in order to preserve broader structures of power rather than altering deeply seated attitudes, which the manifesto locates in the institution of the patriarchal family. The patriarchal family structure naturalizes oppressive divisions between the sexes, and then social structures, including industrialized labor, work to reflect and engender these norms as truths.

Throughout the document, the organization asserts its belief that because gay people defy normalized gender roles, the sexual liberation that would be more accepting of gay people could potentially offer alternatives to the present models of masculinity and patriarchal oppression for all people. In this way, the document incisively tracks the reproduction of patriarchal supremacy from individual sexual preferences and gender roles through social units like the family all the way to capitalist systems of production. While striving for a revolutionary, structural political platform, the manifesto does not necessarily interrogate the potential for gay men to reproduce toxic masculinity or patriarchy, or the differential ways gender intersects with race, class, ability, and citizenship. However, in addition to considering the way that oppression becomes internalized, the GLF identifies how gay people can replicate patriarchal oppression within their own communities, specifically through an obsession with youth culture, through binary butch/femme roles, and through compulsory monogamy.
Gay Liberation Front Banner at New York City's Gay Pride Day Parade, 1970. Founded in New York City in 1969, the Gay Liberation Front marked a turn in gay rights organizing to more militant, radical demands and an unapologetic attitude about being gay. Gay pride was a key strategy of the organization to visibly celebrate gay communities and lifestyles.

The manifesto goes on to suggest steps toward this revolution, including realizing that gay lifestyles begin to anticipate, enact, this future liberated society in the present. Two more practical steps that the manifesto proposes are to develop consciousness-raising groups and gay communes based on values of more thoroughly understanding and critiquing multiple modes of oppression and working to dismantle one’s own attachments to personal property, lovers, privacy, and current prioritizations of work and leisure. The GLF manifesto then offers a list of immediate demands that counteract the direct acts of oppression perpetuated by family structures, the police, employers, health-care providers, educational systems, and various laws. The document and the organization itself were instrumental in advancing gay pride as a key strategy for visibly celebrating gay communities and lifestyles and thus modeling their vision for a broader audience and consequently shifting social structures and cultural values.

**Organization Structure and Membership**

The GLF proposed redefining the family from a biological, nuclear unit toward a looser affiliation of people, which was mirrored in the group’s organizational structure as well as their political collaborations. By connecting sexual liberation to dismantling larger systems of power, the GLF regularly worked in coalition with liberation movements against
militarism, racism, sexism, and capitalism, and was inspired by the radical movements of the 1960s. Similarly, the organization’s structure was a decentralized matrix of committees and subgroups that pursued their own specific goals, programming, and actions, while also contributing to the image and vision of societal transformation put forward by the GLF as a whole. An informal group of founding members held “think-ins” to establish an intentionally unstructured set of guidelines or rules for the organizations. GLF meetings were to be run by consensus, and there were only three guiding rules for all chapters: (1) no one could serve on the steering committee for more than two months; (2) heterosexuals could not serve on the steering committee; and (3) no one could serve on the office collective for more than three months. Further guidance came from the movement’s expansive set of demands and principles agreed upon in December 1970 and a manifesto circulated in October 1971.

Early membership of the GLF leaned heavily toward young urbanites, but due to the organization’s expansive politics and the efforts of key founding members such as Marsha P. Johnson, Sylvia Rivera, and Martha Shelley, the group included more gender, class, and race diversity than previous movements, which tended to be segregated along these lines. The GLF explicitly included drag queens, transgender people, queer women, working-class individuals, and people of color. The movement became quickly transnational, again primarily in urban centers of “Western,” white-dominant countries: the United States, Canada, the United Kingdom, Australia, and other parts of Western Europe. Core members of the US GLF included Michael Brown, a young leftist organizer; Martha (Altman) Shelley, poet, activist, and president of the Daughters of Bilitis; Bob Martin (pseudonym Stephen Donaldson), leader of the Student Homophile League at Columbia University; Karla Jay, pioneer of lesbian and gay studies, student at Barnard College, and later professor at Pace University; Lois Hart, founder and prominent activist; Marty Robinson, member of the Mattachine Society; and Bob Kohler, anti-racist and early AIDS activist. They organized marches to protest the lack of or skewed representation of gay people in Time magazine and the Village Voice, who refused to print the word gay in their ads, as well as radical study groups, fundraising dances, and consciousness-raising groups. These eventually became semiautonomous cell groups, such as the Planned Non-Parenthood Cell, the June 28th Cell, and the Red Butterfly Cell, each with its own specialized agenda. There are claims that the ideas and practices of GLF were more heavily influenced by groups on the West Coast, though their history often is contested and overshadowed by that of their New York partners (Power 1995).

**GLF in Canada and the United Kingdom**

In Canada, the first GLF, called the Front de Libération Homosexual (FLH), was established in November 1970 in Montreal in response to police raids of gay establishments, similar to those executed on the Stonewall Inn. The group disbanded just two years later, however,
when forty of their members were arrested for failing to obtain a liquor license for one of their events. There was a sister group in Vancouver, British Columbia, which developed from a commune called Pink Cheeks. This group enjoyed a slightly longer life, opening a drop-in center, publishing a newsletter, and gaining support from the Georgia Straight, but it eventually folded under competition from other local gay rights organizations (Warner 2002).

While the Gay Liberation Front was importantly transnational and decentralized, its influence remained largely Anglocentric as it quickly spread across the United States and the United Kingdom and established communities in Canada and Australia. The movement’s UK network was particularly widespread. The first GLF was established in London on 13 October 1970, by Aubrey Walter and Bob Mellor at the London School of Economics, where Mellor was a student. From this instantiation, UK chapters of the GLF maintained close connections with academic institutions, establishing an annual national conference at the University of Birmingham, and by 1971 the GLF was officially recognized as a political movement by the national press. The Gay Liberation Front in the United Kingdom staged a number of high-profile direct actions, most notably the 1971 Festival of Light Disruption. The Festival of Light was a morality campaign planned by a fundamentalist Christian group; at its opening held at the Methodist Central Hall, Westminster, members of the GLF dressed in drag interrupted the meeting for a kiss-in, while other members made a ruckus with horns, displayed banners, and released mice. Another unit disguised as workers gained access to the hall’s basement and turned off the building’s lights. This dynamic intervention garnered the movement a reputation for provocative, creative actions that were acutely effective.

The UK GLF’s success was due, in part, to its innovative, cohesively fragmented structure consisting of segments such as the media group, which published a newspaper called Come Together. The antipsychiatry group worked to counter the pathologizing of homosexuality, which was often informed by close relationship between psychiatry and religious institutions/values. To this end, the GLF made progress in decreasing the use of electric shock treatments intended to correct or cure homosexuality. A women’s group worked to make present the voices and experiences of women and to resist the potential replication of patriarchy in a male-dominated group. The communes group organized alternative living structures to begin to apply the founding belief in dismantling nuclear family structures. The youth group worked specifically with members younger than twenty-one to fight for youth rights and reduction of the age of consent, which was often enforced disproportionately to prosecute homosexuals. The action group planned specific events such as dances in town halls, gay days in parks, and general meetings. The street theater group dreamt up exciting, effective aesthetic interventions to enact and support the movement’s broader political aims.

Like their counterparts in the United States, UK GLF groups were highly coalitional in their
activism, participating in protests against the Industrial Relations Bill and joining demonstrations against internment in Northern Ireland, though these movements sometimes attempted to play down the involvement of their gay comrades. Another major success, which some have claimed to be the root of London’s gay pride march, was the Gay Day held in Hyde Park in August 1971, followed by a march to Trafalgar Square organized by the youth group. The following July, the first gay pride march retraced this path, marching from Trafalgar Square to Hyde Park for a gay pride party. This march was attended by over a thousand people and overseen by twice as many police (Feather 2007).

These sorts of collaborative political endeavors are rarely untroubled, however. For instance, repeated attempts by the women’s group of the GLF to join the women’s liberation movement were resisted. In October 1971 they attended the Women’s Liberational National Coordinating Conference but were told that their concerns were esoteric distractions. The GLF group refused to be shut out and grabbed the microphone, compelling much of the conference to listen to their concerns and successfully centering a lesbian voice in the women’s liberation movement, beginning the long process of forging lesbian-feminist solidarity.

The End of the GLF and Its Legacy

The Gay Liberation Front’s unstructured network of affiliate groups and its broad, coalitional political platform were both the organization’s strength and its ultimate downfall. Most iterations of the GLF struggled to maintain coherent membership, and discord easily emerged among the loose arrangement of political commitments and beliefs. Even so, the details of how the GLF disbanded and the legacy of this movement hold important keys for better understanding shifts in queer politics from the 1970s to the present.

One of the significant contributions of the GLF was their insistence that coming out about one’s sexuality is a political act. Inspired by the feminist belief that the personal is political, the GLF helped to change the view of sexuality from a private secret that should be seamlessly integrated and largely unacknowledged in the public sphere to a political standpoint that advocated not only for the recognition of rights for LGB individuals, but for political shifts more broadly. However, at the same time, making the personal political produces the distinct risk that the individual becomes the primary unit around which rights should be oriented. Toward the end of 1971, a divisive conceptualization of rights emerged in the GLF, causing a rift between members who saw sexual liberation—of which coming out was one part—as a transformative gesture in confronting structures of masculinity, homophobia, patriarchy, and more, and members who began to campaign more and more around single issues. This latter group became known as the “straight gays” because their political beliefs and efforts mirrored heteronormative mores and did nothing to deconstruct structural oppression.
In the United States, these internal tensions officially terminated the GLF in 1972. The US-based GLF inspired the formation of a number of groups including the Lavender Menace—radical lesbian feminists who pushed for the inclusion of lesbians in the feminist movement. The drag caucus of the GLF morphed into the Street Transvestite Action Revolutionaries, founded by Sylvia Rivera and Marsha P. Johnson, which provided support for queer youth, homeless people, and trans women of color. In the United Kingdom, the movement lasted until about 1974, when it splintered into a number of organizations, some of which survive today. These include the London Lesbian and Gay Switchboard, Gay News, Icebreakers, and the celebrated theater group Bloolips. The Leicester Gay Liberation Front’s resource information service Gayline is still functioning and even received funding from the National Lottery. Peter Tatchell, a wellknown GLF activist, founded Outrage!, an organization that stages performance-based protests and employs tactics influenced by the GLF, including “zaps”—playful, disorderly demonstrations intended to embarrass public figures. Further afield, GLF-inspired political movements FAHR and FUORI! were formed in Paris and Italy, respectively. The UK GLF papers are held in the Hall-Carpenter Archives at the London School of Economics.

The fracturing of the GLF into multiple international groups and organizations exemplifies its broad-reaching political aims and in many ways permits the movement’s work to carry on in pressing for societal transformations. These persisting organizations, movements, and publications are tangible legacies of what was and the persistence of GLF’s political vision that has yet to be realized. A less concrete but perhaps more impactful legacy of the Gay Liberation Front was the political ground they had prepared and the social awareness they had galvanized by the time HIV/AIDS began to emerge. Thanks to the widespread efforts and manifestations of the Gay Liberation Front, there existed a network of related organizations, a public pride in LGB sexuality, and a foundational social understanding and support for members of LGB communities.

Debates about gender equality and the rights and identities of sexual minorities have been at the forefront of postcolonial African politics since the 1990s. Addressing the pressing issues of gender inequality and state-sponsored homophobia requires an understanding of how historical and social processes shaped gender and sexual identities in African societies (Epprecht 2008; Essien and Aderinto 2009). Numerous anthropologists and historians have critiqued the tendency of colonial-era ethnographers to impose European gender norms and conventions on otherwise flexible African gender identities (Gevisser and Cameron 1994; Murray and Roscoe 1998; Allman, Geiger, and Musisi 2002; Epprecht 2008; Fallon 2008; Essien and Aderinto 2009). Because sexual and gender identities are culturally constructed, African expressions of these categories did not conform to Western dichotomies or binaries.

**Overview of African Gender Expressions**

The ethnocentric ethnographies of colonial anthropologists (and their African acolytes) often failed to distinguish between “sex” and “gender” (Amadiume 1987). By treating gender and sex as one and the same, colonial anthropologists failed to highlight occasions when or situations in which women could become men in social terms and vice versa. Even in social and political contexts where women became “men,” as Ifi Amadiume (1987) has observed about the Igbo, anthropologists often tended to regard them as “manly” or “manlike.” The tendency of colonial anthropologists to consider gender flexibility in African societies as an aberration, rather than as a constituent part of a spectrum, led to the imposition of a male-female binary on local sociosexual expressions. In order to understand historical African gender expressions, Africanists have called for the need to decolonize contemporary scholarly understandings of these social categories. By confusing or conflating sex with gender, contemporary scholars may provide distorted understandings of how men became women and vice versa in political, religious, and ritual contexts (Amadiume 1987; Oyewùmí 1997).
Pushing this argument further, Oyèrónké Oyewùmí (1997) argues that the concept of
gender did not exist as an organizing principle among the Yoruba. Studies on gender (and
sexuality) in African societies, Oyewùmí explains, have not been “decolonized” and thus
rely on Western categories of knowledge. To explain her point, Oyewùmí distinguished
between what she termed as “anatomic sex,” “anatomic male,” and “anatomic female” to
emphasize the nongendered attitude toward the relations between the human body and
social roles, positions, and hierarchies (1997, xii). However, Oyewùmí’s claim about the
absence of gender in precolonial Yoruba culture has been challenged. For instance, J.
Lorand Matory (2008) shows that Yoruba myths and legends were not devoid of gender
categories. Likewise, Yoruba religious initiations and spirit possession performances
among Sángò and Yemoja priests in Òyó North employ both gendered and nongendered
arrangements and combine those representations in powerful mixed metaphors. For
example, “cross-dressing” or “transvestite” priests in Yorubaland could be regarded as
performing and/or expressing gender. Rather than having an absence of gender, Yoruba
culture seems to have deployed this social category in ways that emphasize gender
inversion and flexibility. Similar studies on the Akan/Asante suggest that gender was
central to that culture’s social and political organization. Like the Yoruba, the Akan had
gendered deities. Female deities in particular often required women spokespersons “who
knew the ways of the deity” (Akyeampong and Obeng 1995, 491). Certain rituals, especially
the cleansing and reintegration of social deviants such as kleptomaniacs and witches
(abayifuO) into Akan society, were the preserve of women priestesses (Akyeampong and
Obeng 1995).

Gender inversions and flexibility were crucial in many precolonial and contemporary
African cultures. Scholars have identified these flexible gender practices in African societies
such as the Igbo, Yoruba, and Akan/Asante where postmenopausal women could become
“honorary men,” sons, or even kings (Amadiume 1987; Akyeampong and Obeng 1995;
Oyewùmí 1997, 2011; Achebe 2011; Semley 2011). Through the biography of the early
twentieth-century female king Ahebi Ugbabe, Nwando Achebe (2011) examines the
continuities and changes in the overlapping constructions and definitions of female
masculinities and manhood in the colonial Nsukka Division of Igboland. For Achebe, female
masculinity underscores the ways in which women performed malegender political and
social roles within an Igbo society dominated by men. Ahebi’s dual position as a female king
and a warrant chief in the British colonial administration epitomizes Igbo women’s female
masculinities. Despite the rapidly changing colonial landscape, Ahebi’s reign makes it
possible for Achebe to challenge and complicate gendered categories such as “woman” and
“prostitute” in order to recognize a multiplicity of African female masculinities, while
delineating the limitations of such gendered transformations. Such female masculinities
included “female headman,” “female king,” and “female husband” (Achebe 2011, 2).

In examining the historical and political meanings of motherhood in the Yoruba town of
Ketu, Lorelle D. Semley draws on parallels from West Africa and the Brazilian diaspora. By
exploring what she terms “public mother figures,” Semley (2011, 135) argues that the roles of women in African societies were far more complicated than previously thought. In discussing these complex gender relationships, Semley argues that subordinate men in Ketu could be viewed as “wives,” and women who were royal advisers could be viewed as men. By relating the concept of public motherhood to kinship and politics, Semley shows that powerful mother figures survived the Middle Passage and French colonial rule in Benin. In discussing Ketu in the context of the African diaspora, Semley shows the ways in which the powerful symbols of motherhood were sustained on both sides of the Atlantic during the slave trade. Whereas “public mothers” were partnered with kings in Ketu, their counterparts in the Afro-Brazilian religion of Candomblé, known as “mothers-in-saint,” were paired with men. These striking semblances are important in understanding the ways in which gender ideas and power were transformed and deployed in different precolonial, colonial, and postcolonial contexts in West Africa and the Brazilian diaspora. Despite the stultifying constraints of enslavement and colonialism, gender in the Yoruba diaspora in Brazil and in West Africa did not conform to a specific stereotype.

**Imposition of Binary Western Gender Categories**

The imposition of rigid Euro-Christian gender norms in parts of colonial Africa tended to enhance the gendered status of men and undermine gender flexibility (Allman, Geiger, and Musisi 2002). In many ways, African men facilitated the ways in which colonial regimes in Africa “invented” customary or native law (Ranger 2000; Allman, Geiger, and Musisi 2002). African males often welcomed the opportunity to exercise greater control over the females in their households and societies. Women thus became victims of African and European colonial patriarchal structures (Schmidt 1991, 1992). For instance, in Southern Rhodesia (present-day Zimbabwe), colonial and African patriarchal structures tended to reinforce each other by attempting to control women’s labor and their migration to urban areas. The control of women's migration and economic activities was not only central to colonial rule in Southern Rhodesia but also entrenched the gender roles (Schmidt 1991).

Elsewhere in colonial Africa, women were largely confined to the margins of “traditional” and modern governance (Allman, Geiger, and Musisi 2002). For example, British colonial authorities, with their bias against women's political and economic autonomy, undermined the dual-gendered political systems of Asante and Buganda in favor of a male-dominated indirect rule (Allman, Geiger, and Musisi 2002). The political systems in Asante and Buganda emphasized gender complementarity. Male and female rulers jointly exercised political power over different spheres. Nonetheless, British colonial rule in Asante and Buganda slowly but effectively encroached on the political space accorded women in those polities. Under colonial rule, queen-mothers were subordinated to kings in order to provide support to the male-dominated system of indirect rule (Allman, Geiger, and Musisi 2002). As queen-mothers became less significant in the colonial administration in Asante and
Buganda, women became casualties of the sexual politics of colonialism (Hanson 2002).

Other studies (Moodie and Ndatshe 1994; Banks 2012) have shown the ways in which gender roles could be inverted in same-sex relationships in (pre-)colonial and postcolonial southern Africa and Ghana. Despite the above examples of gender specificity in ritual and sociocultural and religious practices, gender flexibility was far from being an aberration and was crucial in shaping African social and political organization. Evidence for ritualized gender inversions has been recorded in sixteenth-century Angola and Namibia. For example, cross-dressed male diviners known as zvibanda, chibados, quimbanda, gangas, or kibambaa, who were often possessed by female spirits, performed female sexual and social roles. The “transvestite” zvibanda were also known to have anal sexual intercourse with their clients for a fee. This ritualized sex is in itself a highly gendered act and was thought to bring about prosperity, agricultural abundance, good health, and protection from evil spirits. The zvibanda and other “cross-dressing” religious figures may have influenced the African-derived Candomblé and Santeria religions in Brazil and Cuba (GALZ 2008).

**Njinga (R. 1624–1663)**

Njinga was the most powerful ruler of the Mbundu people of present-day northern Angola for nearly forty years (1624–1663), including for a time as leader of the neighboring kingdom of Matamba and of the invading Imbangala people, much feared for their cannibalism as well as military ferocity. The daughter and sister of successive kings of the kingdom of Ndongo, she first came to power through election by the royal court following her brother's death (which she may have engineered). While she called herself queen or lady, she also sometimes referred to herself with the same term historically applied to kings (ngola), thus emphasizing her legitimacy as a strong and inspiring leader. She amply demonstrated that leadership in deeds over the decades through intelligent diplomacy, performance of ritual, and sometimes ruthless politics. Indeed, Njinga's reign was characterized by almost continuous war against the Portuguese and their African allies, and she personally led many successful battles (Thornton 1991; Heywood 2017). That dogged defense of independence has made her a hero of Angolan nationalist histories. Her reputation for resistance to Portuguese colonialism and cultural arrogance was also carried across the Atlantic with the Mbundu and Kongo people whom the Portuguese shipped into slavery in Brazil, where her name still resonates today as an icon of Afro-Brazilian culture.

Njinga's gender expression and sexuality tend to be understated in the nationalist traditions, but they certainly attracted much attention during her lifetime. Contemporary accounts by Europeans were often openly hostile to her and prone to exaggerate or sensationalize the most negative, scandalous aspects of her behavior. The more lurid of these contemporary accounts then got picked up by novelists in the eighteenth century (e.g., Castilhon [1770] 1993) and may even have influenced the
Marquis de Sade (1740–1814) in his depiction of a sexual dystopia in his fictionalized African kingdom Butua (Epprecht 2007).

A consensus nonetheless emerges from the contemporary accounts that Njinga not only defied conventional feminine roles, attire, and conduct, she may also have taken both male and female lovers. Among the former, she is said to have had multiple male concubines and formal marriages to men. One such marriage was to an Imbangala lord whom she required to dress in women’s clothes and to address her as a man. During that period she also required a virtual harem of male concubines to dress as women and to cohabit, chastely, with her female bodyguards. After her conversion to Christianity in 1657, she married again, when she was around seventy-four years of age, in a formal church service, first dismissing her dozens of consorts then taking a “graceful ... beautiful ... young boy” in monogamous union (Heywood 2017, 200).

Northern Angola and western Congo were historically populated by patriarchal societies, but, in addition to Njinga, the region also produced a disproportionate record of powerful, charismatic female leaders. Njinga was succeeded as ruler of Matamba by her sister Kambu, also known as Barbara, and several other women who ruled over the following centuries. In neighboring Kongo, a great, millenialist uprising at the beginning of the eighteenth century was led by another woman, Beatriz Kimpa Vita, who claimed to be possessed by the spirit of a male saint. Kimpa Vita as a young woman had married in the normal way but divorced reportedly for her incompatibility to the expectations of feminine comportment. She then trained as a traditional healer, a role also widely reputed to involve the transgression of gender and heterosexual norms (see, e.g., Purchas 1625, 587, 590). After becoming a Christian, she preached abstinence and sexual discipline as a mode of moral resistance to Kongolesi slave traders and their Portuguese allies (Thornton 1998).

It would be highly misleading and anachronistic to interpret Njinga or Kimpa Vita as early exemplars of bisexuality, transgender, or lesbian identity in Africa. However, Njinga especially was undoubtedly queer in the sense of her dramatic nonconformity to gender and sexual norms. Her life speaks to the very powerful role that the public performance of gender and sexuality had in precolonial African politics and society.

**BIBLIOGRAPHY**

Same-Sex Relationships in African Cultures

Anthropologists have long observed that same-sex relationships in many African cultures embody an expression of gender roles that does not conform to biological sex. In Ghana’s Central Region, groups of saso, or “gay” men, perform and experience diverse female-gender roles and identities (Banks 2012). As a priest of the saso community, Œkomfo Kwabena, who died before 2012, sought to develop and provide spaces for the affirmation of queer identities and also challenge prevailing postcolonial views that mark queer identities and sexuality as incompatible with Ghanaian and African culture and experiences. Similarly, in her studies of same-sex female intimacies in Ghana, Serena Owusua Dankwa (2013) challenges the assertion that masculinity in women is a “pathological sign of misidentification and maladjustment” (Dankwa 2013, 171). For Dankwa, Ghanaian or African women who understood themselves in “masculine ways” should not be dismissed as “bad copies of ‘real’ men” (Dankwa 2013, 171). In what she describes as “relational masculinity,” Dankwa (2013, 182) explores the ways in which women appropriate or are ascribed masculine roles in both their socioeconomic and their same-sex relationships. For example, by positing one’s self as the “man” in such a same-sex relationship, “he” is required to provide for “his” lover. By assuming the position as the obaa barima, or “man-woman,” one does not change bodily styling to reflect that gender role but rather the “ideal of assuming a provider role” often associated with biological males (Dankwa 2013, 187).

Elsewhere in southern Africa, gender flexibility and inversion in same-sex relationships was crucial among ethnic groups such as the Zulu, Shona, Ndebele, Xhosa, and Fengu. For instance, the southern African practice of taking boys or youths as temporary wives was quickly adapted to the mine compounds. Far from their spouses back home, mine workers began to experiment with same-sex hlobonga (or nonpenetrative, prenuptial sex). The
“rules of mine marriage” (umteto ka sokisi), as it was called, provided rules of conduct for such mine relationships. Mine “wives,” or nsati (literally meaning “wife” or “woman”), were usually young boys who performed feminine duties such as cooking and fetching water and firewood. Males who performed these feminine roles became feminized in their dressing and appearance. However, as these feminized young men grew up, they “graduated” to masculine roles. Initially, the colonial authorities of Natal handed heavy punishments including lashes and imprisonments for this gender transgression (GALZ 2008). By the end of the nineteenth century, however, the practice had become normalized in the mines (Moodie and Ndatshe 1994). The flexible gender identity inherent in mine marriages ensured that “wives” could graduate into masculine roles when they matured and got the financial means to do so. By emphasizing seniority and the providing role of “husband,” mine marriages in southern Africa tended to reinforce the idea of relational masculinity (Dankwa 2011).

The rising tides of state-sponsored homophobia, patriarchy, and understandings of gender as fixed categories in contemporary Africa tend to obscure the complex expressions and inversions of gender and sexuality. Not surprisingly, such trends are driven by neoconservative ideas and anxious masculinities inherited from the colonial period but continuously inflamed by postcolonial governments and religious activists (Msibi 2011). That said, the representations of an increasingly homophobic Africa tend to generalize and homogenize the phenomena of homophobia on the continent and regard it simply as a hangover from colonialism. Such generalizations tend to ignore or oversimplify the ways in which diverse languages, nationalities, Islam, Christianity, traditional African religions, colonial legacies, global inequalities, and Western imperialism shape and inform homophobic legislations and discourses in Africa (Thoreson 2014).

In conclusion, African expressions of gender and sexuality have been historically diverse, fluid, and dynamic, albeit within a heteropatriarchal context. These sexual identities do not fit Western gender binaries stereotypically associated with men or women or the homosexual-heterosexual dichotomy. Rather than being regarded as “traditional” or static, the expression of flexible gender identities was rooted in internally and externally influenced political and socioeconomic changes within African societies (Hobsbawm and Ranger 2000; Matory 2008; Oyewumi 1997, 2011; Thoreson 2014). To be fair, same-sex intimacies and gender nonconformity were part of African sexual identities. It must also be pointed out, however, that colonial-era legislations and Christian moral and gender ideals are not solely responsible for institutionalized gender inequality and the “growing tides” of nationalist-driven homophobia and the assault against gender-nonconforming persons in postcolonial Africa. Rather than homogenizing homophobia and gender bias in Africa or solely attributing that phenomenon to colonialism, it is more useful conceptually to emphasize the diverse historical, ideological, economic, and political contexts and legacies driving the persecution of sexual and gender-nonconforming minorities in Africa (Thoreson 2014).

Semley, Lorelle D. *Mother Is Gold, Father Is Glass: Gender and Colonialism in a Yoruba Town*. 

The cultural, social, and economic forces behind violence against women in Latin America, including trans women.

Feminicide is a gender-based act of violence that refers to the killing of women based on their social or biological gender and the characteristics attributed to that gender. In contrast to the gender-neutral term *homicide* (the killing of a human/*Homo sapiens*), *femicide* was coined by US feminists to shed light on the existence of gendered hate crimes —on the misogynistic murder of women and girls because they are female (*Radford and Russell 1992*). *Feminicide* and *femicide* have oftentimes been used interchangeably, although it is important to note the discursive history of each term. The Mexican feminist scholar Marcela Lagarde first introduced the term *feminicidio* (feminicide) into academe in 1987 (*Monárrez Fragoso 2002*) and Julia Monárrez Fragoso was the second to use it in order to describe and raise awareness about the clusters of sexual murders of women and
girls that were first observed and documented in the Mexico-US border region of Ciudad Juárez, Mexico, during the 1990s (Monárrez Fragoso 2002). The term feminicide is therefore a closer translation of the Spanish term feminicidio, and some argue that the usage of this term is designed to reverse the hierarchies of knowledge and challenge claims about unidirectional (North-South) flows of transnational theory (Fregoso and Bejarano 2010). Given the intersectionality of gender and sexuality, misogynistic violence is also linked to homophobic and transphobic acts of violence against individuals based on their sexual orientation and/or gender-nonconforming identity. Transfeminicidio (transfeminicide) specifically refers to the murder of transgender individuals as a result of transphobic violence—“a form of gender-based violence, driven by a desire to punish those seen as defying gender norms” (United Nations High Commissioner for Human Rights 2011, 8). The use of the term transfeminicide seeks to highlight the specific individuals who are being targeted and the different experiences and circumstances that these individuals are forced to live under (Radi and Sardà-Chandiramani 2016).

Feminicide and transfeminicide in Latin America are the culmination of larger historical, cultural, political, legal, and economic conditions that have helped gendered and sexual violence become all too common, claiming thousands of women’s lives in this region since the 1990s. Because the appearance of feminicide victims in Ciudad Juárez coincided with the beginning of the North American Free Trade Agreement (NAFTA; signed in 1993), which brought manufacturing plants (maquiladoras) to the US-Mexico border and employed a largely female labor force, the feminicides in Ciudad Juárez have also been termed “the maquiladora murders,” because many of the victims were employees at these plants (Arriola 2010, 26). As of February 2005, according to Amnesty International, more than 370 young women and girls had been murdered in the cities of Ciudad Juárez and Chihuahua. (Amnesty International 2005). More recently, prosecutors from the state of Chihuahua reported that in 2010, 270 women were killed within the state; of these murders, 247 occurred in Juárez. Despite the conviction and incarceration of several suspects (such as bus drivers, gang members, and a highpaid research chemist who was working for various US companies in Juárez after having served a fourteen-year sentence for rape in the United States), the murders and disappearances of women continue unabated. Both local and national governments in large part deny the problem of pervasive gendered violence, and their inaction leads to an exacerbation of the problem.

Along with Mexico, other countries in Latin America such as Guatemala, El Salvador, Honduras, Argentina, the Dominican Republic, and Colombia also report high incidences of feminicide and transfeminicide. In 2006 Amnesty International reported that more than 2,200 women had been murdered in Guatemala alone since 2001. Feminicides in these countries stem in large part from the continued use of gendered weapons of terror that were first used by paramilitaries during decades of military repression and civil wars between the 1960s and 1990s. These countries have a long history of accepting gendered violence and the government’s and judiciary’s role in normalizing misogyny. In El Salvador,
for example, massacre survivors' testimonies from the 1980s and 1990s reveal that paramilitaries raped women and girls before killing them and throwing their bodies in mass graves (Danner 1994). Maria Guardado, a torture survivor, recounts how paramilitaries kidnapped her, beat her, applied electrical wires to her breasts and genitals, raped her, and then sodomized her with a wooden rod, leaving her in a pool of blood (Vasquez 2007). War criminals in El Salvador were rarely prosecuted. In the case of Guatemala, too, where a thirty-six-year civil war (1960–1996) took the lives of over 200,000 people, indigenous women were murdered, and there was little accountability for their deaths. In 2013 the war criminal and military general Efraín Ríos Montt (1926–2018) was tried and found guilty of genocide but was later acquitted because the court ruled that at the time he committed the crime it was not classified as genocide yet under Guatemalan law. Although civil wars may have ended, postwar Guatemala and El Salvador continue to be plagued by gendered violence and other forms of extreme violence caused by former, trained ex-military and police members, paramilitary and guerrilla forces, and street gangs. When the state fails to hold the perpetrators accountable, impunity not only intensifies the subordination and powerlessness of the targets of violence but also sends a message to society that male violence against women is both acceptable and inevitable (Ogrodnik and Borzutzky 2011).

Indeed, feminicides continue to occur because of a culture of impunity, corruption, and lack of accountability in Latin America. This kind of impunity is rampant as a result of (1) state complicity and/or fear of investigating and prosecuting powerful families and drug cartels (oftentimes with entrenched systems of patronage); (2) inadequate forensics or investigative facilities; or (3) perpetrators or members of security forces being protected by special immunities (Washington Valdez 2006). Local and national governments by and large minimize the existence of these gendered crimes. When authorities are forced to acknowledge the number of dead women's bodies, they tend to blame the victims, saying they were probably prostitutes who were leading a double life unbeknownst to their families. The attorney general of Chihuahua, Mexico, Arturo González Rascón, famously stated in 1999 that “women with a nightlife who go out very late and come into contact with drinkers are at risk. It's hard to go out on the street when it's raining and not get wet” (quoted in Amnesty International 2003, 2). Not only are authorities not properly investigating the crimes or bringing the culprits to justice; they regularly malign and discredit the victims and insult their families.

**A History of Patriarchal Culture in Latin America**

Historically, violence against women’s bodies in the Americas has been a commonly used weapon of terror and colonialism and a hallmark of warfare. As historians have noted, Spanish soldiers abducted and raped indigenous women during the conquest and subjugation of Amerindian peoples and their lands from the sixteenth to nineteenth
centuries. Native women were seen as sexual beings free for the taking, and indeed, sexual violence against Native women was common after invasion and the institutionalization of Spanish colonialism from the late fifteenth century well into the nineteenth (Castañeda 1993). As the writings of the Mexican author Octavio Paz (1914–1998) demonstrate, men's violence against women has routinely been used to assert their machismo, domination, and masculinity (Madsen 2015). This history of violence against women in the Americas and the influence of the Roman Catholic Church shaped Latin American culture into a highly patriarchal, conservative society with a clear sense of proper, divided gender roles. There exists a culture of marianismo (that expects women to be good daughters, mothers, and wives—to be virginal, obedient, submissive, and maternal like the Virgin Mary). Women who step outside of these roles by becoming educated, political, or economically independent or by enjoying leisurely activities and/or having sex for pleasure or without its principal aim being procreation are regarded as malas mujeres (bad women) who are disrupting the proper patriarchal structure of the family and society. Indeed, these are precisely the types of hegemonic patriarchal gender codes that queer women activists and writers in Latin America have directly been challenging since the 1970s. As Carla Trujillo explains in Chicana Lesbians: The Girls Our Mothers Warned Us About (1991), lesbians are culturally regarded as representing the ultimate transgression against patriarchy because they reject male dominance by exerting their self-sufficiency. Queer women are therefore a source of fear and loathing (to men) but are also a source of admiration to those Latinas who seek feminist models of empowerment. Ultimately, gender-directed violence in Latin America may stem from a cultural backlash, as women, feminists, and LGBTQ individuals are seen as gaining greater personal autonomy and independence while men lose ground (Livingston 2004).

To be clear, gendered violence is both public and private, national and international, implicating both state governments and individual perpetrators. It encompasses systemic, widespread, and everyday interpersonal violence, from within border motels to the factory and from the domestic home to the halls of justice (Fregoso and Bejarano 2010). In Latin America, domestic violence routinely goes unreported and unnoticed by police authorities. When a woman is reported missing, the authorities wait until three days after she has gone missing to find her, demonstrating no sense of urgency to protect a woman and save her life (Arce 2010). Women can oftentimes become targets of violence by individual perpetrators (oftentimes intimate partners) who are attempting to reassert their power over them or by the state itself, which punishes these women after death by preventing them from obtaining justice and redress.

Gendered violence in Latin America has been characterized by a heinous and graphic degradation of female and transgender victims' bodies (through rape, genital mutilation, dismemberment, burning, penetration with foreign objects, etc.) (Washington Valdez 2006). As the forensic psychologist Candice Skrapec (2010) notes, this form of sexual violence carries definitive elements of hatred and rage, while amounting to the utmost
devalorization of women. To kill a woman in such a vile manner requires the perpetrator of the crime to regard a woman's body as disposable, as unworthy of being, and of little value. Such violence is a product of a patriarchal ideology that conditions men to see women and transgender individuals as an inferior sex that is not accorded the same value as men and is not entitled to safety or care, which is what so many feminists—both straight and queer—have focused their political activism on. Indeed, attitudes about and discourses on the disposability of women and their bodies abound in the private and public sectors in Latin America, but especially in US-Mexico border cities such as Ciudad Juárez and Tijuana. Conveniently located just across the border, these border cities are considered sites of vice and lawlessness, and women are regarded by Americans as sexual commodities to be consumed and readily discarded (Tabuenca Córdoba 2010). Popular American discourses of “the dead hooker” reveal this common sentiment. For example, a popular T-shirt marketed and sold to North American men on the now-defunct website Sinfulshirts.com proudly read: “I Killed 40 Prostitutes in Mexico and All I Got Was This Bloody T-Shirt” (Caputi 2010, 287).

Such a culture of female devalorization and patriarchal gender dynamics is also integrally tied to a culture of homophobia and transphobia, leading to similar but also distinctive forms of violence against LGBTQ individuals throughout Latin America. According to the nongovernmental organization Transgender Europe’s Trans Murder Monitoring Project Update of 2016, Latin America has one of the highest rates of violence against the LGBTQ community in the world. A total of 2,115 murders of transgendered people were reported worldwide between January 2008 and April 2016. Of these, 1,654 (78 percent) were reported in Central and South America: Brazil (845), Mexico (247), Colombia (108), Venezuela (104), and Honduras (80) (Transgender Europe 2016). Six of the ten countries with the most murders of trans people are in Latin America: Brazil, Mexico, Colombia, Venezuela, Honduras, and Guatemala. Argentina is in eleventh place. In a conservative Latin American culture where traditional gender roles are hierarchical and assigned distinctive values, LGBTQ people are seen as disrupting the social order. They are largely discriminated against and denied jobs. Unable to find secure employment, many trans women in Latin America must work as prostitutes, which leads to the further stigmatization that comes with the profession (REDLACTRANS 2012).

Whether sex workers or not, trans women live in fear every day that they may become targets of violence. A 2003 report by the Inter-American Commission on Human Rights and other reports from the region show that violence against LGBTQ individuals is becoming more extreme: they are often stoned, tortured, and raped before they are killed, and crimes often go unpunished. Oftentimes, crimes against the LGBTQ population go unreported because of fear of reprisals and skepticism regarding the justice system (Brocchetto 2017). When LGBTQ individuals do go to the authorities, they are usually regarded more as suspects than as plaintiffs or witnesses. Moreover, because the majoritarian view in most countries in Latin America accepts only binary, cisgender, heterosexual individuals,
oftentimes when a trans individual is a victim of transfeminicide the case will often go uninvestigated because the government will not use their chosen name, but rather their birth name, which often results in not being identified by their friends or relatives (Radí and Sardá-Chandiramani 2016). Fleeing such homophobic and transphobic violence in their countries, many transgendered people have migrated to the United States or Europe seeking refugee asylum status. The United Nations High Commissioner for Refugees calls the exodus from El Salvador and other Central American nations—Honduras and Guatemala—plagued by gang violence, a refugee crisis (Renteria 2017).

The Globalized Economy and Feminicide: The Case of Ciudad Juárez

Women, especially poor women, play a significant role as workers in the global economy. Because corporations and their power to set standards of worker treatment encourage general hostility against poor working women, many scholars have argued that the price of globalization has been poor women’s lives. The growth of the border city of Ciudad Juárez’s globalized economy has been used as a case study to understand such economic dynamics and their impact on women worldwide. In the 1990s Ciudad Juárez experienced rapid, exponential industrialization as a result of the signing of NAFTA between Mexico, the United States, and Canada. Maquiladoras—manufacturing factories owned by foreign, multinational companies—proliferated in the area, attracted by no taxes, readily available cheap labor, much lower costs of operation, and fewer safety and health regulations. In Juárez alone, by 1999, approximately 330 maquiladoras—more than 75 percent owned by US corporations such as Nike, Acer, RCA, Delphi, General Motors, IBM, and 3M—employed about 220,000 workers, of whom “approximately 60 percent were women” (Wright 1999, 459).

The maquiladora industry created new opportunities for employment for women outside the home and in the factories, but its exploitation of the mostly female working poor in Mexico, combined with the effects of rapid industrialization, has incited increased gender violence while securing Mexico’s significant role in the globalization of the economy at the US-Mexico border. According to the 2000 Mexican census, 50 percent of the economically viable population in the state of Chihuahua worked at a maquiladora, and most of these workers were female. Women are hired in these factories because their smaller hands and fingers [can] better assemble tiny parts of export goods, such as light bulbs, cassette tapes, and recorders. The ideal maquiladora worker that emerged was thus a hybrid of stereotypes based on sex, race, and class—she was not only more docile and passive than Mexican men, but submissive, easily trainable, and unlikely to pose problems with union
These factory job opportunities led to a large-scale migration of rural, southern Mexicans and Central Americans (many of whom are indigenous) toward cities along the border whose infrastructure could not keep up with such rapid industrialization, urbanization, and population increase. Because the majority of jobs in the maquiladoras are given to women, much of that migration was undertaken by female migrants traveling alone. These same women ended up vulnerable, living alone in dangerous shantytowns lacking proper street lighting at night. Incidents of domestic violence and feminicide in Ciudad Juárez have risen in the wake of the heavy industrialization along the border. In the period between the implementation of NAFTA in 1994 and 2001, “the homicide rate for men increased by 300 percent, while for women it increased by 600 percent” (Wright 2007, 415). But neither the state nor the corporations are held accountable for creating an unsafe living and working environment and for failing to invest in infrastructure and security that would protect the residents and workforce.

In the neoliberal, globalized economy, maximum profit is the ultimate goal. As such, maquiladoras exploit women workers all over Latin America, with garment and textile factories dominating in the Caribbean and Central America. According to a 2014 report by the Center for Economic and Policy Research, in El Salvador, Guatemala, and Honduras, approximately 350,000 workers are employed in the maquiladora industry: 80,000 in El Salvador, 150,729 in Guatemala, and 120,000 in Honduras (Crossa 2015). In the Dominican Republic and all over the Caribbean, however, factories have been shutting down during the first two decades of the twenty-first century as owners, undercut by competition from Asia, seek to cut labor costs by moving production elsewhere (Werner and Bair 2009). Latin American women workers in these factories, like their Asian counterparts, are largely expendable. The value of workers’ bodies lies in their production efficiency, and once that value is extracted, US and multinational corporations do not care to protect the female laborer’s health or safety; if she is injured, is killed, or goes missing, she is simply replaced (Wright 2007). Women workers labor under substandard conditions that include exposure to toxicity in their workplace, sexual harassment, and arbitrary disciplinary methods of women such as monthly menstruation checks (Gaspar de Alba 2010). When maquiladora workers go missing, the maquiladoras themselves, or rather the US corporations behind them, seem little interested in pursuing the investigation of these murders affecting the lives of their personnel or in seeing justice prevail. This systemic abuse is the result of investor privileges, guaranteed under NAFTA and repeated in the Central American Free Trade Agreement (CAFTA; signed in 2004), that virtually immunize the transnational investor from accountability for harm to the worker, anticipated or not, when conducting
business in Latin America. Amnesty International has denounced the Mexican government’s complicity in the deaths of these women by failing to establish worker safety regulations: “the Mexican State must ensure that the maquilas meet their legal obligations to their employees, with special emphasis on the physical, sexual, and mental wellbeing of the female workers” (2003, 7). Amnesty International calls for such measures because the Ciudad Juárez and Chihuahua cases display conditions under which “impunity reigns” and there is an “inability of the state authorities to address these violent offences against women, which also means that Mexico is in breach of international conventions to which it is a party, including standards that are specifically aimed at eliminating violence against women” (2003, 4,5). Consequently, it has been suggested that amendments be made to NAFTA and CAFTA that include human rights provisions.

**Activism**

Tired of public officials’ indifference to feminicides in Ciudad Juárez, Mexico, by the late 1990s, grassroots organizations and nongovernmental organizations emerged among victims’ families and women’s and human rights activists acting in solidarity with the families. Activist groups mobilized and organized massive marches, candlelight vigils, press conferences, public monuments and memorials, artistic performances, building occupations, and confrontations with public officials to bring both local and international attention to these crimes and violations of women’s human rights. Many of these groups were headed by mother-activists, such as Voces Sin Eco (Voices without Echo), Nuestras Hijas de Regreso a Casa (May Our Daughters Return Home), and Justicia para Nuestras Hijas (Justice for Our Daughters). Cross-border, binational groups emerged, including Amigos de las Mujeres de Ciudad Juárez (Friends of the Women of Ciudad Juárez; based in Las Cruces, New Mexico) and the Coalition against Violence (based in El Paso, Texas, and Ciudad Juárez, Mexico). These groups helped raise funds for victims’ families and called for a binational task force to foster cooperation in investigating the crimes, including greater FBI involvement. Casa Amiga, a nonprofit organization established in 1999, was the first rape crisis center in Ciudad Juárez; it was created to provide shelter to victims of sexual crimes and domestic violence, as well as counseling, medical assistance, and legal aid for victims or their families. Mujeres de Negro (Women in Black) is a group that raises awareness of the feminicides through the spectacle of public mourning: women dress in black at governmental offices and large public events. Their solidarity actions have occurred in different US cities and all over the world, often at Mexican consulate and embassy offices, pressuring the state to provide answers and redress (Staudt and Coronado 2002). In 2004 Eve Ensler (1953–), the American author of *The Vagina Monologues*, joined Mexican activists to organize the V-Day March in Ciudad Juárez and create a global activist movement that seeks to end violence against women and girls.

Indeed, since the 1970s, mother-activist movements have gained momentum across Latin
America as a strategy for seeking justice in repressive political climates. The group CoMadres and the Asociación Madres de Plaza de Mayo (Association of the Mothers of the Plaza de Mayo) were formed in El Salvador and Argentina, respectively, by mothers whose children disappeared during military dictatorship and state terrorism in their countries (Bejarano 2002). Taking to the streets and protesting at presidential palaces, these mother-activists set an example of how to overcome traditional limitations on women and motherhood in Latin America by leaving the domestic realm and taking to the public sphere. Today, mother-activists are persistently engaged in the struggle for human, political, and civil rights in Latin America and elsewhere.

Such binational and international cooperation has been key to seeking justice. Some victims' families in Ciudad Juárez are working with El Equipo Argentino de Antropología Forense, (Argentine Forensic Anthropology Team), a nonprofit organization that assists in the analysis of forensic data and the preparation of reports. American volunteers in Ciudad Juárez continue to this day to routinely undertake community rastreos (searches), physically scouring the desert in search of disappeared women's bodies (Gamboa 2017). Through all these activists' outreach, international human rights organizations and investigators such as Amnesty International, the United Nations Human Rights Council, and the Inter-American Commission on Human Rights have helped investigate some crimes and seek justice for victims' families.
body was found in a rural field in Gualeguay, in Entre Ríos province. Latin American feminist activists have used marches, candlelight vigils, press conferences, public memorials, confrontations with public officials, and social media to raise awareness of gender-based violence across Latin America.

Latin American women have also taken to social media to raise awareness about gender-based violence and harassment. On Twitter, the hashtags #NiUnaMas (not one more), #NiUnaMenos (not one less), and #MiPrimerAcoso (my first harassment) have aimed to raise awareness about gender-based violence across Latin America. #MiPrimerAcoso encourages women to share their first experience of gender-based harassment, as a first step to stopping feminicide. Because gendered violence, feminicide, and transfeminicide are a lived reality in most of Latin America, coalitions and movements tend to cross international boundaries.

For example, the coalition between women's and LGBTQ grassroots activists, with their mutual denouncement of violence and the structural conditions that keep millions of citizens marginalized and unprotected, and with their shared demands that their human rights be recognized by the state, has served to highlight both the shared goals and the importance of coalition building in both groups' political activism. In defiance of hegemonic gender codes all over Latin America, there have been mass demonstrations and LGBTQ pride parades in countries such as Argentina, Brazil, Chile, Paraguay, Colombia, Ecuador, Venezuela, Bolivia, Puerto Rico, Cuba, the Dominican Republic, Mexico, El Salvador, Honduras, and Guatemala, with straight women activist allies demanding equal rights and protections for all alongside their LGBTQ peers. There have also been international lesbian political demonstrations such as the biennial Marcha Lésbica (Lesbian March) in Mexico City, which brings together lesbians from all over the world to make lesbian identity valiantly visible and to demand an end to violence against all women. Indeed, activists within the Marcha Lésbica make clear the connections between LGBTQ rights and women’s rights; slogans that the participants in the 2013 march chanted included “Not one more murder!” As part of the lesbian march’s denouncement of violence, organizers of the past three marches have expressed solidarity with the aforementioned Nuestras Hijas de Regreso a Casa, a nongovernmental organization consisting of relatives of young women who have gone missing in Ciudad Juárez. Moreover, the participants have demanded the nationwide legalization of same-sex marriage and abortion and increased punishment for crimes committed on the basis of sexuality (Sanchez 2013). The collaborations and merging of issues illustrated within the international Marcha Lésbica are but one example of the promise of coalition building and of the future possibilities for political activism across nations, genders, and sexual orientations, all united in the effort to put an end to gendered violence throughout Latin America.

FILMOGRAPHY

The term *gentrification* refers to the buying and renovation of stores in deteriorated urban neighborhoods by those in the middle- or upper-income brackets. The process of gentrification often includes new corporate development, as chain stores move into the area to take advantage of the influx of money in the neighborhood. While gentrification revitalizes depressed areas, the increase in property values often forces out lower-income residents who can no longer afford to live there. Some have criticized this homogenization and “insipidifying” of urban centers to make them “hip” and “cool” (Schulman 2012; Sorainen 2016). This argument positions gentrification as a largely negative development that damages the diversity of urban communities and the understanding of cities as places for creative and transgressive politics. Sarah Schulman, a US queer cultural critic, lesbian Jewish artist, and AIDS activist, refers to this development as “the gentrification of the mind,” where the small, diverse, and independent bookshops, cafés, art spaces, and queer bars are replaced by big, soulless, standard chains: “It leaves the replaced without context and the replacers with a distorted sense of self” (2012, 178). This was one of the most important queer critiques of the idea that if the young, educated, and affluent surged back into cities, they would reverse suburban flight and urban decline—an idea that was popularized by American urbanist Richard Florida in his 2002 book *The Rise of the Creative Class*. In that work, he claimed that the creative class, and in particular gay people, could transform cities to make them more diverse, vital, and economically more successful.

The mantra of the creative class’s transgressive powers became the leading rationale among those who were thinking about and working on city development. However, fifteen years after the launch of his influential book, Florida stated that he had been wrong. In his revised view (2017), what the creative class did for cities was not to make them more livable places but to increase segregation; the same forces that power the growth of the major Western cities also generate their biggest challenges—in other words, gentrification leads to unaffordability, segregation, and overall inequality. These changes threaten not only the ethnically, sexually, and culturally diverse bohemian neighborhoods but also those of the middle class. This unfortunate development had already been described by Schulman: “Even for a city employee with a financially secure job, getting ... the car in this
economy usually requires having family money or a partner with a much higher income—it requires being floated in some way” (2012, 168).

**Gentrification in European Cities**

To provide a clearer sense of the generalizability of the case studies discussed in depth in this entry, it is helpful to point out that the metropolitan developments in other countries such as France, Great Britain, and the Netherlands connect the discussed phenomena to other European regions. Neighborhoods such as Camden, Islington, and Hackney in London; the Marais in Paris; and the Kinkerbuurt in Amsterdam suffer from the same phenomenon already familiar in Californian cities in the Silicon Valley, where café workers, cleaners, and other people working in the service sector or even in middle-income salaried jobs could not afford to live in the cities as rents and house prices skyrocketed, subsidized housing was sold off, and uber-rich people moved in. Short-term rentals for tourists facilitated by such sites as Airbnb are often blamed for causing the high rents and the shortage of long-term rentals, and many European major cities such as Barcelona and Berlin have tried to take actions against Airbnb. Many people working in low- or middle-income jobs in European cities still have to commute for hours or live temporarily in vans on roadsides or in parking lots.

Exterior of the Fairytale Pub in the Kallio District of Helsinki, Finland. Small, independent queer businesses like this pub for older, non-scene gay men are threatened by the gentrification of their neighborhoods.
This rapid gentrification has produced a side phenomenon known as “double trouble,” meaning that in the process of being gentrified, big cities also gentrify their neighbors (Harrap 2018). For example, in France it is not only the formerly bohemian district of the Marais in Paris that has lost its cheap apartments, independent art vibe, and colorful queer residents; the gentrification effect of Paris has extended to Bordeaux, the beautiful port city in southwestern France renowned for its university and wine. The influx of Parisians seeking to relocate to Bordeaux is blamed for gentrifying that smaller city, and tourism is steeply rising; in six months in 2017 alone, the number of lodgings offered on the short-term rental site Airbnb surged by 62 percent in Bordeaux. These developments prompted the publication of an open letter to the city council by the Front de Libération Bordeluche Face au Parisianisme (FLBP; Bordeaux Liberation Front against Parisianism), an “anti-Paris” citizens’ group with over 9,000 followers on Facebook. Referring to Bordeaux’s recent regeneration, which has turned it into one of France’s most desirable locations, the letter suggests the city is at risk of losing its very identity: “You are relegating your families to live forever in cardboard houses 30km from the center so that your latest conquerors can take even more selfies in your worldly company” (quoted in France 24 2017).

The same double-trouble effect can be observed in the United Kingdom, especially in Birmingham, which has become the home of many former Londoners who cannot afford to live in London anymore. Some of these new residents commute daily to London to work, while others find jobs in the Birmingham area. In this process, the diversity of both the London and Birmingham urban landscapes has suffered: queer pubs and bars have closed while huge commercial chains, such as Starbucks and Jamie Oliver’s restaurants, replace the independent cafés, bars, and art and community spaces in Camden, Hackney, Islington, and the Birmingham city center. The common thread in all these European cities, from the early twenty-first century onward, has been extracting money from the areas, not creating inclusive communities. When prices go up, the market is thought to be doing well, while the diversity of the cities suffers, and in the process, the old historical European cities became large, boring open-air museums where Airbnb tourists wander among the historical buildings and drink their lattes in the same chain cafés or their chardonnay in the same chain restaurants whatever the country or the city (Sorainen 2016).

The existing gentrification literature and research concerns mainly US cities and cannot be applied directly to European urban developments, even though there are common trends. For example, the gentrification history of two Helsinki districts, Punavuori and Kallio, matters to the development of these formerly mixed-class or working-class neighborhoods because these are the two urban sites where the effects of gentrification on gender and diversity have been most evident in Finland. In the United States, the Mission and Castro areas in San Francisco and the Lower East Side and Williamsburg areas in New York City function as parallel examples of the impact of gentrification on queer neighborhoods and communities but within a different national context. Parallel Nordic examples include the Hornstull and Skanstull areas of the Södermalm district in Stockholm, the Grünerløkka and
Old Oslo neighborhoods in Oslo, and the Nørrebro and Vesterbro districts in Copenhagen, all of which used to be working class but underwent the process of gentrification in different ways. In all these examples, one of the districts started to gentrify in the 1980s while the second district started in the mid-1990s. The parameters for the gentrification of these districts vary, even as they also follow certain megatrends. For example, in Copenhagen, Nørrebro is much more mixed in terms of ethnic background than Södermalm in Stockholm or Kallio and Punavuori in Helsinki, but it is also less queer and still rapidly gentrifying.

**Finland's Place in Europe**

Compared to queer neighborhoods in other world cities in terms of quality of life, sexual expression, and LGBTQ communities, the two major Helsinki queer districts, Punavuori and Kallio, have been influenced by different political, economic, social, and racial histories and gendered implications that determine openness and formations of queer life. This is partly because although Helsinki, as the capital of a Nordic welfare state with liberal legislation and an open atmosphere, is today known as one of the most democratic and least segregated urban havens for queer people, Finland's historical and political role on the edge of Europe has always been complicated. Finland has had a challenging political history since its declaration of independence in 1917. It stands apart from the other Nordic countries and its significant neighbor, Russia, not only in its language, history, and culture, but also in its lack of natural resources, such as oil; instead, it has built its success on high-quality, free education and the development of innovations, such as the text message, the maternity pack (a kit of items given to new mothers for their newborn babies), and the sugar substitute xylitol. However, it was a largely agrarian, poor country until the mid-1960s, when the government pushed for rapid transformation into a more urban, welfare-state society. Thus, cities and urban life have not been centrally formative issues for the national memory as they have in many other Western countries; an inclusive, desirable, sexually diverse city life was a vision that appeared in the public forum only in the 1980s. For example, research on prosecutions of women for same-sex sex acts shows that most of the 1950s Finnish trials took place in rural areas outside of Helsinki.

It is also noteworthy for the US-dominated discussion about queer gentrification—where gay neighborhoods (such as those in New York City and San Francisco) are indelibly linked with the politics of race—that there are other contexts for theorizing on this topic. For example, it is important to note that Finland's historical immigration policy differs significantly not only from that of the United States but also from those of the other northern European and Scandinavian nations: it has had an extraordinarily tight immigration policy, and therefore, Helsinki is very white. This background is crucial for understanding the queer histories in Helsinki in that race issues have not been a substantial topic in its queer urban cultures until very recently. In addition, Finland has had
different “national traumas” regarding gender and sexuality than its neighboring countries of Sweden, Norway, and Russia. The cruel civil war of 1918, with its lethal concentration camps, where many women and children were killed, haunts the national narrative as well as the construction and politics of its public memory. Furthermore, the national history of having been part of both the Swedish and Russian empires, and the two lost wars against the Soviets in World War II, have created specific problems for the construction of urban male homosexuality in Finland as both inside and outside of national politics and borders. Tom of Finland (the pseudonym of the celebrated Finnish artist known for his homoerotic fetish art in the late twentieth century) recounted in an interview how he used to cruise both Russian and German soldiers in the parks of Punavuori while he was in the Finnish military service during World War II: “I didn’t feel guilty at all about supposedly jumping politically from one end to the other. I wanted to try everything that was available” (quoted in Arell and Mustola 2006, 22). This history continues to contribute to a specific national discourse on “Finnish” urban sexuality. It can be observed in parliamentary debates and research literature that stresses the equality of the sexes and liberal attitudes toward gays, lesbians, and queer-identified people. It has also had an impact on the development of the two main queer districts in Helsinki, Punavuori and Kallio, affecting the gentrification of these historical districts in slightly different ways.

**Helsinki’s Punavuori and Kallio**

There exists a certain gay/queer distinction between these two gentrifying districts, between the more “respectable” gay and lesbian area in Punavuori in the south and the “rougher” queer district of Kallio in the northeast of the city. In terms suggested by Samuel R. Delany (1999) in his work on “gay urban transformations,” Punavuori was historically a rougher sea-harbor area with sex trade, bordellos, seafarer pubs, and drug dealers until a 1980s facelift brought in new business money as well as commercial artists and architects, which ironically narrowed the possibilities for interclass connections and networking in an increasingly homogeneous social grouping. In contrast, in Kallio, the early twentieth-century Finnish working-class movement’s political organization entailed a certain requirement for working-class sexual “decency” and self-maintenance, and as a proxy, the area was associated with a less commercial queer visibility that provided, again paradoxically, more interclass contacts and less identity- and class-based social grouping until the first decades of the twenty-first century.
Iso-Roobertinkatu Street in the Punovuori District of Helsinki, Finland. This street was the site of the first gay bar in Helsinki (open from 1984 to 1992), as well as numerous other queer bars (including the one shown, now closed). The biggest queer disco in the Nordic countries, Don't Tell Mama, was located on this street before it closed in 2011.

Some studies suggest that it is lesbians who have been on the front lines of gentrification because women, arguably, often form gentrification’s vanguard after being displaced from areas that are no longer affordable on incomes relatively lower than men’s. Gay men then follow the lesbian “settlers” and put up commercial gay businesses, and next come the affluent straight clientele who bring raised prices and heteronormative, gender-discriminating attitudes that force lesbians out. This is not much discussed in scholarly research because the lesbian presence tends to be less visible everywhere, and because it poses a methodological problem for research because there are neither the census figures nor enough resources to produce a sufficiently extensive qualitative study. To some extent, this is true for Punavuori, where communes were created by lesbians in the early 1980s; the first steady, semicommercial locale there was established by the national LGBT organization Seta (Seksuaalinen Tasavertaisuus, or “sexual equality”) in 1984, and commercial gay bars arrived after that. Meanwhile, in Kallio the most important lesbian bar, Nalle Pub, opened in 1994, but had to close its doors in 2013 when gentrification rendered the district both too expensive for and unfriendly toward its lesbian residents.
From the mid-1980s into the second decade of the twenty-first century, Punavuori’s liberal but commodified mainstream “hetero-friendly” gay scene has appealed to the metropolitan impulse to inscribe a personal mapping of the city as part of the quest for a distinctive sense of self (Cook 2003). By contrast, the working- and lower-middle-class historical district of Kallio, the central location for urban resistance and protest, has offered cheap rents and interclass, cross-gendered queer comradeship not only for the radically political, but also for the closeted, poor, and untrendy. Both areas have been crucial to the genesis of ideas of lesbian, gay, and transgender identities in the city, to promoting the visibility of the LGBTQ community, and to making people aware of the nonheterosexual history and present of Helsinki.

Effects of Gentrification

When neighborhoods such as these become more gentrified, some things are lost as well as gained. Younger, affluent, white lesbians and gay men might feel that they do not need specific queer sites anymore because they can have their lattes and dry Rieslings in the trendy, hipster cafes and bars that, on the surface, promise a relaxed urban attitude to the diversity of genders and sexualities. However, many not-so-well-off, not-so-young, not-gender-conforming, or too-political lesbians and other queer people have noticed that this liberal promise is often almost aggressively heteronormative. According to one Kallio butch lesbian in her mid-fifties in a 2018 Facebook exchange with the author: “I went to this hip bohemian Kallio bar with my fan scarf and ordered a beer, yelling cheerfully ‘go HIFK!’ [the local ice hockey team]. The straight male hipster bartender was obviously truly shocked, and told me to go out at once.” When there is no real community anymore—that is, no lesbian or queer bars, cafés, art spaces, and bookshops—these individual experiences tend to alienate nonconforming queer people. The lesbian or queer person must either conform or be excluded if she is too poor or will not adjust to heteronormative gender behavior expectations. Those gays, lesbians, or transgendered persons who can afford good service in trendy, hip places where money buys respect no matter what one’s identity or habitus, might feel that they actually benefit from the possibility of not feeling marginalized.

Gentrification thus changes the ability of these districts to be a queer alternative to other, more commodified scenes in the city because queer visibility gets lost, and the lesbian or gay as a distinct political figure does not get recognized anymore in the streets, bars, or cafés in Kallio or Punavuori as queerness becomes merely one of the commodified “lifestyle choices.” This adds to the possibility of exclusion of those whose sexual or gender “performance” does not follow the homo or heteronormative rules. As Schulman describes the problem: “Most heterosexuals still think of themselves as superior and most gay people submit to this out of necessity or lack of awareness” (2012, 115). Others are assumed to be less important, even if they are tolerated. A few examples from the second decade of the twenty-first century show that the more political lesbian and queer businesses in Kallio
were becoming less visible or moving to the area’s frontiers, to the next, less gentrified district. For example, a lesbian businesswoman and her gay friend owned two pubs. The first, located in Kallio, was popular among the straight middle-class cultural clientele while also offering a safe space for lesbians and gays. Its queer policy was not evident from an external perspective because the pub “looked” straight, but if one was familiar with the local lesbian and gay scene, the queer clientele of the pub became obvious. The second pub, opened later by the same owners, was located in the more affordable but less gentrified district of Vallila, and was more openly lesbian and queerdominated. At that time in Punavuori, where the official LGBT organization and the commodified gay business had been booming, it was not possible to find a similar semipolitical commercial response to the forces of gentrification. The different histories of these two queer districts, Kallio and Punavuori, have to a large extent determined the way their queer residents have envisioned their role as members of these urban communities.

The Future of Cities

Finally, some researchers argue that the increased academic focus on cities, urban developments, and megatrends in economics and politics has diverted attention from the more important issue of the role of the state in everyday life and the reimaginings of that state that would broaden our thinking about the crises of sovereign political entities. From the queer point of view, this is a crucial critique because the urban developments described in this entry are not simply the result of natural or inevitable trends taking place in the Western liberal sphere, where people are seen to be free to move and to form identities and communities as long as they do not harm others. Instead, they point to the massive impact of capitalism on cities that makes them not better and more diverse, but more prone to standardization and a sort of posh or, better, superrich ghettoism. In this scenario, the major benefits go to the new “heritocracy,” the new elite regime in which one’s place in society is no longer earned by one’s own output (as in meritocracy) but via inherited access to wealth, good education, and affluent jobs in the world of global corporations. These are the people who can afford to live in cities and pay for the services they think are cool. As queer people, nonwhite people, and women find it more difficult to be supported by their families, to get a good education, to get well-paid jobs, and to find wealthy spouses, this leads to more heteronormativity in society, not more diversity as Florida (2002) first thought. But as Schulman writes, although gentrification holds a certain emotional attraction, because it feels safe to be and think like others—particularly others who look trendy, affluent, and successful—it is also true that “anything that humans construct, humans can transform” (2012, 171). However, such a transformation would require the frightening act of stepping out and stepping forward to form and participate in new knowledge communities. In this act, access to theories of state and to histories of urban LGBTQ lives and communities and, more generally, to free education, would help people to realize the potential of cities to be sites for more diverse, inclusive, and democratic urban
futures.

Hanhardt, Christina. *Broken Windows at Blue’s: A Queer History of Gentrification and

http://allegralaboratory.net/scenes-of-gentrification/

The history and current status of sexual minorities in this West African country.

The existence of sexual minorities in precolonial African societies is a heavily debated issue. In 2011 the BBC organized a debate, widely patronized by political, traditional, civic, and religious leaders in diverse African countries, on the topic “Is Homosexuality African?” The purported “un-African” nature of homosexuality is a common reason used by African leaders to justify the criminalization of homosexuality. In a 2015 address to the United Nations General Assembly, the president of Zimbabwe Robert Mugabe proclaimed that Africans are not gay. Earlier that year, during a trip to Kenya, US president Barack Obama had encouraged Kenyans to protect the rights of sexual minorities. This request was rejected by Kenyan president Uhuru Kenyatta, who asserted that gay rights were an American value and alien to Kenya. Ghana has been no exception. In 2011 Ghanaian president John Atta Mills declared that he would safeguard Ghana’s culture by not decriminalizing homosexuality (Ghana Broadcasting Corporation 2011).

And yet, there is ample anthropological evidence of cultural practices among precolonial Ghanaian societies that nurtured sexual and gender diversity. For example, the Nzemas of Ghana were said to have practiced a same-sex marriage custom known as *agɔnwole agyale* (friendship marriage). As part of this tradition, friends of the same sex who were physically attracted to each other could express their love for each other by getting married. These marriages were contracted in an almost identical manner to heterosexual marriages and contained similar elements, including payment of a bride-price and sharing a matrimonial bed (Signorini 1973). Ashanti kings were documented to have taken men they fancied as male consorts and showered them with love and affection (Reindorf 1895). Both the Ashantis and Denkyiras practiced the ɔkra (soul) tradition that was ambiguously steeped in homoeroticism (Ellis 1883). The ɔkra custom permitted aristocrats to select same-sex slaves, whom they treated specially and with whom they had intimate relationships (Hutchinson [1861] 1967). The Fantes believed that a person's sexual attractions originated in his/her soul. Men and women with heavier souls were said to be naturally attracted to women, whereas men and women with lighter souls preferred men (Christensen 1954).

By the time sub-Saharan African countries began to obtain independence from their...
colonizers (starting with Ghana in 1957), knowledge of these practices had eroded, and a new narrative of a completely heterosexual Africa was created (Epprecht 2008). There are several reasons why this occurred. First, oral tradition was the primary mode for many African societies to transmit their history; because sexual practices were not preserved through oral tradition, on account of cultural mores against public discussions of sex, the colonialist narrative took precedent (Tamale 2011).

© PIUS UTOMI EKPEI/AFP/GETTY IMAGES

Ghanaian President John Atta Mills in 2010. In 2011 Atta Mills declared that he would safeguard Ghana’s culture by not decriminalizing homosexuality, a statement in keeping with the widespread assumption in Ghana and the rest of Africa that homosexuality is a foreign practice.

Second, colonialism introduced formal education and boarding schools, which limited the interactions of children with their parents and grandparents and further disrupted the passing on of traditions from one generation to the next. Over time, knowledge of some customs disappeared, particularly silently practiced or ambiguous customs that revolved around sex and sexual/gender diversity. The agɔnwole agyale practice, for example, has now become obsolete (Grottanelli 1988) to the point that it is unknown to younger generations. For instance, in a 2017 conversation with Kuukuwa Andam, Yaa (full name withheld to protect privacy), a thirty-one-year-old Ashanti businesswoman and university graduate from Maaban, revealed that she did not know about the ɔkra tradition. However, her grandmother (age unknown), who was not formally educated and was a nanayere (king’s wife), was familiar with this practice and correctly identified and explained its tenets. Here, the effects of formal education in breaking familial bonds and hampering the transmission of historical/cultural knowledge are evident. Additional factors propelling...
these new heteronormative narratives include the influence of nonnative religions (Christianity and Islam) and attempts by Western-educated Africans to dispel colonial notions of the African as primitive, barbaric, and amoral (Epprecht 2008).

Legal Framework

Another effect of colonialism was the enactment of laws to penalize same-sex intimacy. The Courts Ordinance of 1935 imported wholesale into Ghana all laws of England in effect on 24 July 1874 (the day that the colonial authority established Ghana’s first legislature). Some of these laws banned “unnatural carnal knowledge” and “sodomy.” These laws have been maintained in Ghana’s criminal code, which currently prohibits male same-sex intercourse upon penalty of imprisonment for up to three years.

Although female same-sex intercourse has not been officially legislated against, female sexual minorities are frequently arrested under the guise of having broken this law. The Constitution of Ghana has provisions prohibiting discrimination against all persons, but these provisions do not specifically mention discrimination on the basis of sexual orientation or gender identity. This has led to an intellectual debate among legal professionals as to whether Ghana’s constitution protects the rights of sexual/gender minorities. A Supreme Court case filed in 2012 for these issues to be interpreted was thrown out of court owing to the petitioner’s continued absence from proceedings.

Founding the Movement

Until the 1990s, there was low visibility of sexual minorities in Ghana, and it was asserted in local and international media that there were no sexual minorities in Ghana. Nii Ajen (1998) interviewed some Ghanaian men who admitted to engaging in frequent sexual intercourse with their same-sex partners. Simultaneously, these men generally denied being “gay” or that homosexuality even existed in Ghana or Africa.

This apparent contradiction could be explained by existing cultural/colonial taboos against the public discussion of sex and the fact that at that point in time in Ghana the assumption of identities based on one’s sexual orientation was as novel a concept as it must have been in nineteenth-century Western societies, when words such as *homosexual* were first coined to describe identities (Foucault 1978). For example, festive transvestism has been a part of Ghanaian practice for many years (Geoffrion 2013). During football matches, university events, and other festive occasions, Ghanaian men dress up in a manner stereotypically associated with women. This activity was not, however, tagged as being “gay” or “straight,” although Karine Geoffrion (2013) has observed that it created an outlet for some individuals who were same-sex attracted or trans to step outside heteronormative boundaries.
All this changed in 1998 when the British Council funded training for some Ghanaian sexual minorities. Three of these sexual minorities formed the Gay and Lesbian Association of Ghana (GALAG), which encountered societal stigma and governmental opposition because of its name. To circumvent this opposition/stigma, this group was later officially registered as the Centre for Popular Education and Human Rights, Ghana (CEPEHRG). Funding from some foreign donors, including the Astraea Lesbian Foundation for Justice, was used to rent an office and purchase furniture and stationery.

Using the pseudonym Prince Kweku MacDonald to avoid being identified and persecuted, one of the founding members of GALAG granted the group’s first interview to the press in 2006. The interview occurred in the studios of Joy FM, one of the leading radio stations in Ghana. According to Mac-Darling Cobbinah, the president of the CEPEHRG as of 2018, a miscommunication with some of the journalists in the interview studio led to a widespread rumor that Ghana was scheduled to host its first LGBT conference, which would attract thousands of sexual minorities to Ghana. These rumors led to widespread condemnation of sexual minorities by several Ghanaian leaders, and Kwamena Bartels, the nation’s information minister, declared that the government was implementing a ban on all future meetings that would promote LGBT rights (BBC News 2006).

After about a year, the CEPEHRG slowly resumed its activities and decided to focus mainly on the provision of assistance to members of the LGBT community in Ghana, particularly those who were HIV positive, as some were unable to seek treatment at mainstream hospitals because of stigmatization. Additionally, the CEPEHRG worked with the Commission on Human Rights and Administrative Justice to develop a help line that sexual minorities could text if they were facing discrimination or harassment.

**Challenges**

Sexual/gender minorities face diverse challenges in Ghana. Some members of sexual minorities have been murdered and assaulted. Since 2012, female sexual minorities in Jamestown, a suburb of Accra, have been subjected to frequent mob attacks, and there has been a lack of will on the part of police to arrest or prosecute the culprits. Similarly, vigilante groups called the “Sharia police” have sprung up, mostly in Muslim neighborhoods, and they are known to lure male sexual minorities to places where they are assaulted with barbed wire, whips, and stones.

Schoolchildren accused of being sexual minorities are dismissed from school or lynched by their classmates. After two students at St. Paul’s Secondary School were assaulted by their peers on account of allegations of being gay, the Ghana Education Service recommended that the two students be penalized. Religious organizations often advocate for sexual minorities to be abused; the Ghana Catholic Bishops’ Conference, the Christian Council of Ghana, and the Office of the National Chief Imam have all asked the government to refrain
from protecting the rights of abused sexual minorities.

**Moving Forward**

Since CEPEHRG’s formation, diverse nongovernmental organizations have been set up across Ghana focusing on LGBTI issues. As a result of the stigma and opposition GALAG encountered, most nongovernmental organizations that cater to sexual/gender minorities do not assume names that would make their objectives apparent. One of the most notable organizations is Solace Brothers Foundation, which was established in 2012 and organizes frequent sessions to train members of the LGBTI community as paralegals who can assist sexual/gender minorities who are attacked or discriminated against. Another organization is Courageous Sisters, which was registered in 2017 and is one of the first organizations to focus solely on female sexual minorities. With the assistance of health personnel, Courageous Sisters organizes regular health screenings for its members, as well as training programs to inform them of their rights. Several unregistered sexual minority organizations also operate through private Facebook and WhatsApp groups. As the LGBT movement in Ghana has developed, sexual/gender minorities have adopted a variety of ways to describe themselves. Some use Anglicized/Westernized labels such as “gay” or “lesbian,” whereas others prefer to use reappropriated indigenous terms such as *sasu* (mate) or *supi* (woman who has sex with another woman).

In November 2017 an Al-Jazeera interview of Ghana’s president, Nana Addo Dankwa Akufo-Addo, went viral because of his comments on homosexuality. Akufo-Addo stated that although legalizing homosexuality was not currently on his government’s agenda, it was nevertheless bound to happen, especially as advocacy for LGBT rights has increased (Graphic Online 2017).

In January 2018 Human Rights Watch released a study it conducted on sexual minority rights in Ghana (Isaack 2018). The report was one of the most recent studies on the LGBT community in Ghana to focus not only on the experiences of cisgender gay/bisexual men, but also on those of cisgender lesbians/bisexual women and individuals who are trans. The study documented instances of abuse against Ghana’s LGBT community and the failure of governmental agencies (including the Ministry of Justice and the Police Service) to address this abuse. Human Rights Watch sent letters to these governmental agencies in response to a draft copy of the research findings. In response to this letter, the Ghana Police Service pledged to adopt “more proactive steps and pragmatic approaches” to protect the rights of LGBT individuals (quoted in Isaack 2018, 67).

In January 2018 there was a “coming out” of some LGBT individuals in Ghana. The first trans woman to come out in Ghana, Angela Coleman (popularly known as Madina Broni), was interviewed by the celebrity website GhanaCelebrities.com. The general public’s impression of Coleman after this interview was positive, and people criticized her
interviewer, whom they deemed as asking insensitive questions (Graham 2018). In Coleman's opinion, she was forced by society to change her gender, and she detailed being persecuted as a child because people said she was too feminine for a boy. With the full blessing of her family, she decided to undergo a sex-change operation in Spain, and she said she is now comfortable in her body (Myjoyonline.com 2018). On 20 January 2018, Sika and Ella, a Ghanaian lesbian couple, went public with their relationship. They were the first known Ghanaian LGBT couple. Via the Facebook page of GhanaCelebrities.com, they released a montage featuring some happy moments in their relationship.

There has been some positive representation of LGBT individuals in the arts. Notably, Eric Gyamfi, a Ghanaian artist, has been documenting the lives of Ghanaian sexual/gender minorities through photographs (Naughton 2017). His art exhibitions in Ghana have been popular, and he has received feedback that the exhibitions have caused people to perceive the LGBT community in a more positive light (Magnum Foundation 2017).

Ghilman

JAAKKO HÄMEEN-ANTTILA
Professor of Arabic and Islamic Studies
University of Edinburgh, United Kingdom

A term for a type of male slave or servant during the era of Islamic caliphates, sometimes depicted as the homosexual “beloved” in classical Arabic literature.

The word *ghulam* (plural: *ghilman*) denotes both “youth” or “boy” and “servant” or “slave” in classical Arabic, from which language the word was also adopted by Persian and some other Islamic languages. In the latter sense, it may also be used for an older servant. While the word remained, and still remains, used in this general sense, it also developed a more specific meaning as the personal slave army of powerful men—and sometimes women.

**Historical Background**

From early Islamic times onward, affluent and powerful persons had a retinue of servants, both *khadam* (“servants,” often in the sense of eunuch servants) and *ghilman*. The latter acted as attendants and guards and sometimes made up a private army. During the Umayyad period (661–750), such private armies of ghilman were small and remained rather invisible, but in the ninth century they rapidly gained importance and visibility. They became a strong power element in society and formed major armed regiments under their own leaders, a development that reached its peak in the Egyptian Mamluk (slave) institution, with Mamluks wielding power in Egypt and parts of Syria from 1250 to 1517 under the nominal suzerainty of the Abbasid caliph (the chief civil and religious ruler in Islamic society).

Especially during the Mamluk period, ghilman were systematically trained as soldiers in a strict hierarchical system. The new recruits were often forcibly taken or bought as slaves and usually came from among the Turks. In the Ottoman period (1517–1922) they commonly originated in the Balkans from among the Christian population, and in Islamic Spain many were of Slavonic origin (*saqaliba*). When still young they were converted to Islam and given primary education, which for most of them continued with military training, while a few were trained for other careers. Sometimes the boys were also castrated, and it is often hard to tell from the sources whether they describe castrates or not as castration also opened the doors for preferment; because eunuchs were often used as high-ranking civil servants, it was not always unwelcome or forced.
While ghilman were mainly employed by their masters as soldiers and as a private retinue, there could also be a sexual aspect in their use, although it is worth emphasizing that only a minority of ghilman were involved in sexual relations with their patrons and their role as a personal army was much more prominent than their role as bedfellows. Especially younger boys were, however, targeted and the sexual interest in them was not always welcome, resulting in cases in which such ghilman murdered their patron rather than protected him.

**The Ghulam in Literature**

In literature, the ghulam often appears as a homoerotic, or homosexual, beloved, and he is often qualified as *amrad* (beardless). Homosexual relations seem to have surfaced in the Arab-Islamic culture in the mid-eighth century. Information on ghilman as targets of romantic or sexual interest mainly comes from poetry, anecdote collections (often sharing material with historical works), and erotic manuals. The manuals, though, usually discuss heterosexual love more extensively than homosexual love and sometimes completely ignore the latter.

From the early Abbasid period (750–1258) there are also the works of al-Jahiz (c. 776–868), who discussed erotic relations in several of his works and even wrote a literary debate comparing the merits of slave girls and ghilman as sexual partners (*Mufakharat al-jawari wa-al-ghilman* [Boasting match over maids and youths]), imitated by several later authors. Everett K. Rowson, in his article “The Traffic in Boys” (2008), has suggested that this comparison of boys' and girls' merits as sexual partners goes back to Greek texts, but this seems somewhat improbable. The similarities between the traditions are more probably explained by the somewhat similar social contexts and the nature of these love affairs themselves.

While very rare in earlier literature, homoerotic poetry became a central part of mainstream Arabic literature in the late eighth century, especially through the *mudhakkarat* (male love poems) of Abū Nuwās (d. c. 813), and retained its position until the end of classical Arabic literature in the nineteenth century. Later, Persian and Ottoman Turkish poetry followed suit. In another important genre, wine poetry (*khamriyyat*), the ghulam is regularly found in the role of a beloved cupbearer, or *saqi*. He also became a standard character in prose literature, especially in the *nawadir* (anecdotes), which are mostly of a comic nature. The majority of ghilman were of Turkish origin, and it is no coincidence that in later Arabic and Persian literature Turks became symbols of blond beauty, whereas dark Indians were paragons of ugliness.

Whereas love poems addressed to ghilman were mostly considered socially acceptable and cannot in any sense be labeled underground literature, more sexually explicit genres, which were not as universally condoned, also existed. These are covered by the term *mujun* (shamelessness, impudence), and they contain a variety of sexually explicit material (both
homosexual and heterosexual), atheism, and other sensational topics considered to be breaches of social norms. Even these genres were openly written, but they tended to have an effect on the reputation of the author.

In the mudhakkarat, the ghulam is mostly seen as a more or less platonic beloved, and the sexual aspects of love are rarely explicitly mentioned, with the exception of kisses (literally, the beloved’s saliva), which are compared to wine because of their inebriating effect. The physical description of the beloved is usually sexually neutral; it is the shining face of the beloved and his or her supple body that are described, often in a way that leaves the gender undecided. One of the rare features that sets the male beloved apart is the mention of his moustache, which is usually described as just starting to grow, giving a greenish, not pitch-black, hue to the skin. This was considered beautiful in contrast to a fully grown moustache, which was the sign of adulthood and made the ghulam unattractive in the eyes of his lovers. The newly grown moustache resembles the supple new growth of vegetation, whereas a full moustache is likened to dry and hardened vegetation.

More often than not, it is only the grammatical forms that betray the gender of the beloved in Arabic poetry, while in Persian even this linguistic help is missing. Consequently, when there was no story to contextualize the poem, medieval scholars themselves were often at pains to deduce whether an individual love poem belonged to mudhakkarat or muʾannathat (female love poems), and the same poem may appear in various recensions (critical revisions) in different sections of the collected works of the poet. There is a slight tendency, though, to be more risqué in the mudhakkarat than the muʾannathat, which occasionally helps to decide the question.

In love poems, the ghulam is described as a delicate youth, but in the mujun genre and in comic anecdotes he may also be a robust servant. His role may also switch from the beloved to the lover, classical Arabic literature mostly being very particular in dividing the roles in a love relation into an active lover and a passive beloved. In court circles, love relations between an adult male and a young man or boy were usually considered acceptable or at least silently accepted. Thus, King Qabus ibn Wushmgir (d. 1012) openly advises his son in the Qabus nameh (Mirror of princes) to have sex with both girls and boys instead of restricting himself to either sex. The relation between two adult males, however, was considered degrading to the one who was thought to be in the passive role. Religious scholars obviously condemned all homosexual and all extramarital physical relations.

**Slave Boys and Asymmetric Relations**

While there is ample documentation of a commerce in female slaves bought for sexual purposes, the respective traffic in boys is less well documented, and the evidence is usually indirect. Beautiful ghilman were bought and rented, often technically through a sale that was soon reverted. The law did not say anything about any waiting periods in the sale of
boys, in contrast to slave girls who had been used for sexual purposes and might have become pregnant, and, thus, short-term sales were legally valid even according to the strictest scholars. In religious literature, it is often emphasized that homosexual intercourse is forbidden even with one’s own slave boy, which implies that there were widespread ideas about this being in a sense less prohibited than having sex with others’ slave boys as a form of prostitution. Moreover, in the Shafi‘i legal school, opinions were raised that it, indeed, was a less grave thing, as, based on the analogy of legally valid relations with slave girls, one may mistakenly believe this to be legal, too, and hence err unintentionally rather than on purpose. Usually, when the beard of the ghulam started to grow, he was deemed to have lost his erotic charm, and literature is full of comic or tragic stories of adolescent slave boys trying to shave or pluck their beard to hide the fact that they have reached maturity.

Much of the evidence of the sexual use of the ghulam comes from medieval adab literature (belles lettres), and while the anecdotes themselves may be unreliable as such and the poems hard to interpret in exact terms, the general tone of the literature implies that asymmetric relations between an adult male and an adolescent boy were acceptable in court circles, although they were forbidden by Islamic law. Arabic erotic literature also includes instances of religious scholars and judges who are supposed to have shared this love for ghilman, but the stories about them make it clear that it was considered inappropriate for such men to have homosexual relations. The Islamic “clergy” were clearly expected to follow stricter norms than the lay elite, who adopted looser morals in general, and the same can be seen in attitudes toward, for example, the drinking of wine and playing chess. Such pastimes were mostly condemned by law but commonly indulged in by courtiers and the elite in general, religious scholars excluded.

It was also common to accuse Sufis of corrupting the youth and having homosexual relations with their novices and younger Sufis. In some cases such accusations may have been well founded, but more often they would have been caused by anti-Sufi prejudice, combined with the Sufi custom of using metaphors taken from homoerotic love poetry.

**Other Relationships**

Although love relations were—at least as they are depicted in the existing literary sources—usually asymmetric, there are occasional references to young men in love with each other. Even in these cases, there tends to be some asymmetry in the social status of the two: the most common setting is of a young prince or nobleman in love with his coeval servant or lower-class friend, with the father of the nobleman usually lurking somewhere full of condemnation. There are also stories, however, of kings falling in love with their ghulam generals, who would not have been immature boys. Thus, for example, Tughril Beg (c. 990–1063) was known to have been in love with his commander Khumartakin. One such pair, the Ghaznavid king Mahmud (971–1030) and his servant Ayaz, even became the leading
couple in a number of romantic epics and stories in Persian.

Sources, such as the works of the Egyptian historian al-Maqrizi (1364–1442), contain plenty of information on homosexual relations among Mamluk slave soldiers, with the older Mamluks using the younger ghilman or falling in love with them. It seems, however, that this merely reflects the source situation, and such relations appear to have been equally common at other times and in other circles since early Abbasid times (starting in 750).

There was also a short-lived fashion of slave girls posing as boys in the early ninth century, usually said to have started with the effort of the mother of Caliph alAmin (r. 809–813) to reorient her son’s sexual appetite from males to females. While there is little documentation of this trend, it does appear prominently in the poetry of the age with ghulamiyyat, love poems addressed to girls in boys’ clothes, which must have been a rather shocking sight in a society where clothing revealed much about the social status of a person and was strictly regulated by custom.

The history and current use of these artistic media in queer public expressions.

Conventional accounts of the origins of modern graffiti—illicit writings or drawings on public surfaces—date it to the late 1960s and 1970s, when young people of color in Philadelphia and New York began tagging, or quickly writing their street/code names, on buildings and subway cars with pseudonyms and street numbers in increasingly elaborate ways. Within a decade, stylized designs filled entire subway cars and spray-can art spread, fueled by the popularity of hip-hop, beyond the northeastern United States to around the world. Graffiti is an important medium for social expression and has many twentieth-century precursors among marginalized groups, such as the names written on freight trains by homeless travelers in the 1940s and the territorial markings of street gangs in Los Angeles between the 1930s and 1960s. There are also examples of graffiti in gay film and literature. For example, an intertitle in the 1950 homoerotic film Un chant d'amour (A song of love) by Jean Genet depicts words scratched into a prison wall, including “B.A.A.D.C” (a French acronym roughly translated as “hello to friends in need”). In his 1963 novel City of Night, John Rechy described “frantic scrawls” in bathrooms where same-sex cruising occurred (50). Although graffiti is typically understood (in popular culture and scholarly literature) in heteromasculine terms, there is a significant history of LGBT contributions to the genre.

There are significant affinities between graffiti and queerness. Both are marginal forms of expression organized around difference rather than assimilation. The urban environment has long been a refuge for people who deviate from gender and sexual norms and are punished by society as a result. The city and its institutions, namely bathhouses and bars, as well as other public spaces, such as bathrooms, alleys, parks, and piers, have historically been crucial for the subterranean development of LGBT communities. These spaces became especially utilized in the period of gay liberation from the 1960s to the early 1980s, corresponding to the time when graffiti emerged in its current form as a vibrant street art practice. However, the links between queerness, the urban environment, and graffiti tend to be downplayed if not ignored entirely in conventional accounts of the genre.

Pier Graffiti
An overlooked, though significant, archive of gay graffiti exists in the photographic history of the Hudson River piers of Lower Manhattan in New York City, an abandoned industrial area that was a gay cruising area in the 1970s and early 1980s, before the AIDS epidemic changed the culture of public sex and urban development repurposed the dilapidated piers. For artists such as Alvin Baltrop and Stanley Stellar, graffiti was central to the aesthetics of the piers and was regularly featured in the backgrounds of their photographs. Other artists, such as Keith Haring, Tava, David Wojnarowicz, and Luis Frangella, created graffiti on the piers. For many, the piers were a sexual and artistic urban environment. Wojnarowicz incorporated piers graffiti into his *Rimbaud in New York* series of photographs (1978–1979). He also created graffiti himself at the piers. Wojnarowicz (along with Haring, Jean-Michel Basquiat, and Martin Wong) was affiliated with New York City’s East Village art scene, notable for the first fine art exhibition of uptown graffiti writers. In 1983 Wojnarowicz organized an installation of graffiti and murals at Pier 38 as an East Village outpost.

PHOTO COURTESY OF TARA BURK.

**Detail from Keith Haring’s *Once upon a Time Mural* (1989).** Haring created this mural featuring his signature vibrantly silhouetted figures and various phallic images in the men’s restroom of the LGBT Community Center in the West Village of Manhattan. The mural’s liberation-era theme that sex could be pleasurable and empowering was a radical assertion at a time when the gay community was largely focused on HIV/AIDS prevention measures.

One of the most prolific artists of the piers was Tava, born Gustav von Will. Before his death in 1991, his large, phallocentric paintings of muscular men were fixtures on the piers, often serving as backdrops for the naked men who sunbathed and had sex there. Tava’s paintings
on Pier 46 were so large that they were visible—as were their human counterparts—to tourists aboard the Circle Line cruise boats that passed by. Tava’s work is visible in photographs by gay artists, including Baltrop, Stellar, Arthur Tress, Lee Snider, and Frank Hallam. Another figurative artist of the piers was Luis Frangella, who created large classically inspired heads and nudes on the walls of Pier 34. These appear in photographs by gay artists Peter Hujar and Andreas Sterzing. Many of these works are in the collection of the Leslie-Lohman Museum of Gay and Lesbian Art in New York City.

**Haring and Basquiat**

The graffiti art of Tava and Frangella may be understood within the larger context of gay liberation. After the political activism and riots of LGBT people in the civil rights decade of the 1960s, a period of gay liberation occurred in the 1970s wherein decades of shame and persecution were replaced with pride and social justice organizing. During this time, the first lesbian and gay art group exhibitions occurred, gay bathhouses became legal, and many people “came out” as lesbian and gay. Many gay artists, such as Tava, created artworks that unapologetically celebrated male nudity, promiscuity, and group sex. Such imagery also appeared in liberation-era publications, such as *Fag Rag*, and in murals commissioned for gay bathhouses in San Francisco.

A decade later, when the graffiti artist Keith Haring created a mural called *Once upon a Time* in the men’s restroom at the LGBT Community Center in the West Village of Manhattan (just blocks away from the Hudson River piers), he harked back to this era of sexual liberation, which was cut short by the AIDS crisis. The mural, done in Haring’s signature style of vibrantly silhouetted figures, glorifies gay communal sex and is rife with phallic imagery. The mural’s liberation-era theme that sex could be pleasurable and empowering was a radical assertion at a time when the gay community was largely focused on HIV/AIDS-prevention measures ranging from abstinence to condom use. *Once upon a Time* is particularly well-suited to its location, since men’s public restrooms have historically been places where men who have sex with other men meet. The room housing *Once upon a Time* was later converted into a meeting room and today is devoted exclusively to the Haring installation. Haring, who died from AIDS in 1990 just nine months after completing the mural, devoted his life to creating sex-positive and life-affirming imagery. Haring’s ubiquitous sex-positive signature style, along with the AIDS Memorial Quilt (conceived in 1985 by Cleve Jones and now composed of more than 48,000 panels commemorating people who have died from AIDS) and other public activist art initiatives, played a major role in humanizing the HIV/AIDS crisis.

While in art school, Haring began his artistic career as a street artist drawing in chalk in the New York City subways and writing in paint in the run-down spaces of the Hudson River piers. His work can be found in the aforementioned photographic archives of the piers. For example, a Haring graffiti of two men facing each other, erect penises visible, appears on...
the wall in a 1981 photograph by Stanley Stellar, wherein porn star J. D. Slater, nude from the waist up, leans against a doorway and the artist Peter Hujar is visible having sex in the background. In another one of Stellar’s photographs, a naked man stands in front of a decrepit wall next to one of Haring’s iconic baby images. These photos capture the positive spirit of Haring’s work, which celebrated homosexuality through the idiom of graffiti.

Martin Wong was a gay artist who, before his death from AIDS in 1999, donated his large collection of graffiti art to the Museum of the City of New York, including some of the earliest works by Keith Haring and Jean-Michel Basquiat. Basquiat is an artist who, like Haring, worked in graffiti, street art, and fine art idioms. He began his street art career under the pseudonym SAMO, tagging throughout Manhattan in the late 1970s. Although in his art Basquiat did not address sexuality directly, the black queer aesthetics of his work have been explored in recent scholarship. Contemporary New York City–based artist Earsnot, a queer graffiti writer who also does not make art about sexuality, recalls the stereotype-defying impulses of Basquiat.

In the United Kingdom, some contemporary queer and trans graffiti artists, such as the “Masked Muskequeers,” focus on sexuality in their work in order to celebrate queerness and counter stigmas against LGBT people. In works such as QAF (queer as fuck) a bold pink palette and all-caps letters proclaim queerness as an identity to be proud of. These messages have been subject to vandalism, such as a recent buffing (erasure) of a Masked Muskequeers piece, Stay Queer, to read “Stay Brainwashed.” Masked Muskequeers members quickly restored the piece and embellished it with three rainbows in the colors of the transgender, bisexual, and gay pride flags. These two pieces function in a dual manner: on the one hand, they are affirmative in that they speak directly to marginalized populations offering messages of support and pride; on the other hand, they are confrontational in that they force heterosexual viewers to contend with the fact of LGBT people’s existence.

Social Justice Graffiti

In addition to sexually explicit and homoerotic images in the public sphere, another common theme of queer graffiti and street art is social justice. An early example of this is found in a 1975 photograph by Shelley Seccombe in the collection of the Leslie-Lohman Museum, called Wall Newspaper–West Street at 11th Street, which features two presumably transgender people on Pier 52 in front of hand-painted graffiti that reads “7-5-75. 2:30 pm —Pier attack by Teenagers and Adults responsible for terrorizing people—breaking Pier and probably they set the fire—daytime muggers now work in teams inside. Stay out.” Museum curators have speculated that this warning to the community was penned by the author of Warehouse Newsletter, which contained crime updates and was distributed in local gay bars.
Because women (unlike men) tend to be sexually objectified in the public sphere, lesbian graffiti that emerged in the 1970s and 1980s was more politically than sexually oriented. There are several examples in the photograph collection of the Lesbian Herstory Archives in Brooklyn, New York. One photograph shows graffiti by TK Williams and Arcus Flynn with the spray-painted phrase “WOMEN UNITE ... IMPEACH NIXON” (with two entwined women’s symbols), done in Oklahoma City in 1973 during the Watergate hearings. A photograph by the lesbian documentary photographer Bettye Lane of a gay pride march in New York City in 1976 features people sitting in front of the phrase “Gaywalk, 5th Ave” spray-painted on a building wall. Another Bettye Lane photograph, from 1971, documents graffiti that reads “Lesbian Menace Strikes Again” on the building of the Daughters of the American Revolution in Washington, DC. A 1982 photo by longtime lesbian activist Maxine Wolfe depicts a wall emblazoned with the spray-painted phrase “END LESBIAN OPPRESSION” in New York City.

In the 1990s a new generation of lesbian street artists created works that touched upon both political issues and sexuality. For example, the poster series by New York–based art collectives fierce pussy and Dyke Action Machine redoubled the cultural activist strategies of the late 1980s by such groups as Silence=Death Project and Gran Fury by expanding visibility tactics and intensifying public displays of queer sexuality in the public sphere. Whereas Dyke Action Machine created posters featuring lesbian stand-ins for straight characters in conventional advertising campaigns by companies such as Calvin Klein, fierce pussy avoided the overdetermined field of mass media critique by drawing upon less-mined archives, such as the feminist art movement and queer zines.

During the 1970s murals were important to the social liberation movements happening among gay people, Chicanos, and African Americans. Judith Baca, who identifies as a Chicana lesbian feminist artist, works in a figurative style of muralism that recalls the political golden age of the 1930s in the United States and Mexico. She is best known for the 1976 public art mural The History of California, popularly known as The Great Wall of Los Angeles in Los Angeles. The large mural (13 x 2,754 feet [4 x 839.5 meters]) covers six city blocks and is one of the largest murals in the world. One section, called “The Origins of Gay Rights,” depicts the efforts of such groups as Daughters of Bilitis to advance lesbian and gay civil rights during the oppressive McCarthy era in the United States. The mural is significant because it tells the history of California from the perspective of women and minorities. The social realist style harks back to the US government–funded Works Progress Administration murals of the 1930s as well as to the visual traditions of Mexican muralism by artists such as David Alfaro Siqueiros. Social justice movements that emerged in the late 1960s and 1970s, including labor rights, feminism, gay liberation, and indigenous rights, were important influences on The Great Wall of Los Angeles.

The Philadelphia mural Pride and Progress (2002–2003) carries on this tradition. Designed by Ann Northrup and sponsored by the Mural Arts Program, it depicts in vibrant colors a
crowd at a gay pride festival and includes a historical black-and-white section showing a 1966 march for gay civil rights that occurred in Philadelphia. The 55 x 165 feet (16.75 x 50.3 meters) mural takes up the entire west side of the William Way LGBT Community Center.

Graffiti writers around the globe have responded to sociopolitical debates with public declarations. In Montreal in the 1980s, graffiti written in French, English, or both appeared throughout the urban sphere, referring to gay rights, among other issues. Anna Wacławek notes that although “signature graffiti” writers tend to be young men who work in crews (replicating the working methods and aesthetics of the New York style), “political graffiti” writers in Montreal tend to be individual men and women from varying age groups (2016, 249).

**Queer Graphic Art**

As the subject matter of these works indicates, the late 1960s and 1970s were an important transitional decade, and the graphic arts were an important part of this shift. Graphic illustrations in gay magazines and newspapers and on calendars, posters, buttons, and demonstration placards were distributed at gay bookstores, at gay protests and pride marches, and through mailing networks. They were displayed in homes around the world, contributing to the newfound public, prideful, collective gay identity. After the 1969 Stonewall riots in New York City and the many demonstrations and riots that occurred in the late 1960s, LGBT people were emboldened to create symbols and images to designate their identity in public, to one another, and to the world. Some of these symbols included the pink triangle, appropriated from the symbol used by Nazis to identify homosexual prisoners in concentration camps during World War II. During the HIV/AIDS epidemic that began in the 1980s, the pink triangle became a symbol of LGBT resistance to government neglect and homophobia due to the ubiquity of the poster designed in 1986 by the Silence=Death Project, a group of six men, several with graphic design experience. The design was particularly effective because of its economy: a pink triangle against a black background with “SILENCE=DEATH” written below in white. It looked more like a commercial advertisement than a traditional political graphic. The poster was adopted by the activist group ACT UP (AIDS Coalition to Unleash Power), which used graphic campaigns and confrontational protest tactics to draw attention and demand a response to the AIDS crisis.

In the 1980s and 1990s, graphic design was used to promote sex education, hold public officials accountable, and keep AIDS in the public eye. In addition to the Silence=Death poster, there were sexually explicit stickers and posters distributed in the public sphere by such groups as Gran Fury and fierce pussy, which promoted queer visibility and combated homophobic responses to HIV/AIDS. Despite the ubiquity of this imagery on the streets of New York in the late 1980s, the Silence=Death poster was not included in an exhibition of
political graphics titled *Committed to Print* at New York City’s Museum of Modern Art in 1988, perhaps because it was posted by an art collective and distributed in the streets. The marginalization of street art and graphic activism with queer themes has been redressed in the past decade in a number of exhibitions, such as *ACT UP New York: Art, Activism, and the AIDS Crisis, 1987–1993*, curated by Helen Molesworth and Claire Grace at Harvard University in 2009.

Following in the tradition of ACT UP graphic activists, queer artists have engaged in political vandalism. This ranges from spontaneous writing (as occurred in 1992 when queer activists in San Francisco called out the homophobia of the film *Basic Instinct* by defacing promotional posters) to organized campaigns. For example, Banksy’s satirical 2003 piece *Queen Victoria* depicts the nineteenth-century monarch engaged in a sex act with another woman and has been interpreted by critics as a commentary on the hypocrisy of the British government. In 2008 the Los Angeles–based artist Homo Riot began making street art with in-your-face gay themes, in response to the passage of Proposition 8 in California (a bill that eliminated the right of same-sex couples to marry). The artist plastered images, such as two men kissing, all over abandoned buildings and poles in Los Angeles, fulfilling an important function of queer graffiti and street art: simultaneously confronting the mainstream public with an image of gay sexuality and providing an affirmative image to LGBT audiences. These works echoed the 2006 “Kissing Priests” campaign in Portugal by Opus Gay, a queer art activist group formed in that country in 1998 to promote LGBT rights using stickers, posters, and spray paint/stencil campaigns. Stencils are a quick and effective method for street art activism. Since 2010 in Guadalajara, Mexico, the group Gaystencil has made PDF templates available on the internet so that others can replicate its queer stencils (such as *Beso* or *kiss*).

**Anti-Queer Graffiti**

Unfortunately, there are as many examples of anti-LGBT graffiti as there are of affirmative LGBT graffiti. In South Africa, homophobic messages accompanied anti-AIDS graffiti found on an escalator at the University of Natal ([Bonnin et al. 1998](#)). Antigay graffiti is included in a slideshow of thirty-one still photographs of graffiti in the La Loma barrio of Medellín, Colombia, in the video *Rayones* or “Tags” ([Taylor and Pitman 2013](#)).

Anti-LGBT graffiti often occurs as a defacement of LGBT-positive writing. This is not unrelated to how graffiti artists buff each other’s work, but it is more pernicious. Some examples are detailed in the *Witnesses: Against Our Vanishing* exhibition catalog ([Goldin et al. 1989](#)) and in *AIDS Demo Graphics* ([Crimp and Rolston 1990](#)). In other cases, LGBT people have documented examples of homophobic graffiti. The Lesbian Herstory Archives include a 2005 photograph of a women’s prison in Ontario, Canada, with “KILL LESBIANS” written on an exterior wall. There are multiple examples of anti-LGBT graffiti in the photograph collections of the ONE National Gay & Lesbian Archives in Los Angeles.
Researchers who study latrinalia, also known as bathroom graffiti, find that sexuality is the most common theme, and “homosexual” graffiti tends to be more common than “heterosexual” graffiti, particularly in men's bathrooms.

Homophobic graffiti frequently is in reaction to homosexual graffiti and vice versa; this is known as a response chain, or back-and-forth correspondence between multiple authors (Trahan 2016, 96). The decades-old phenomenon of queer response chains persists in the early twenty-first century. In 2015 a digital mural called Por Vida, featuring two same-sex couples and a transgender person, in San Francisco on the exterior wall of Galeria de la Raza by Manuel Paul of the Los Angeles–based Maricon Collective, was defaced three times, including one time when the male couple was set on fire. As recently as 2017 in Kailua, Hawaii, the artist Jess X Snow created an outdoor graffiti installation with the text “Today I Touched My Queer Body until It Became Cathedral.” The piece celebrates masturbation as a form of self-love for queer bodies of color that are perpetually marginalized in society. Within two days the word queer was blacked out and a large penis was drawn between the hands. In an interview after the defacement, the artist attributed this vandalism to patriarchy and homophobia.
Increase in and Recognition of Queer Graffiti

Today, queer themes appear with increasing regularity in street art. In San Francisco and elsewhere, Jeremy Novy creates gay imagery, such as stencils of leathermen. Rommy Sobrado-Torrico and Crystal are contemporary street artists making queer-themed work in San Francisco. In New Orleans, graffiti artist Hugo Gyrl creates brightly colored images of disembodied hands and noses that are monstrous, playful, and decidedly queer in their flamboyant and fierce aesthetic. In the 2010s there has been a shift toward institutional recognition, with the first exhibition exclusively devoted to LGBT and LGBT-friendly street artists, *A History of Queer Street Art*, opening in 2011 at SOMArts in San Francisco, organized by Novy.

However, queer themes remain lacking in literature on graffiti. Dominant accounts of graffiti tend to focus on its heteromasculine originators, and the contributions of LGBT people have been less acknowledged, until recently. Graffiti writing has been a male-dominated and heterosexual-dominated field, but LGBT people have been involved in it since its first decades. Fundamentally, graffiti is an art form that seeks to communicate. One scholar has identified its power as a medium to give voice to those marginalized in mainstream society. Graffiti can be a powerful statement of personal identity, as well as an outlet for public affirmations of collective identity, particularly in the wake of gay liberation in the late 1960s and 1970s, the HIV/AIDS crisis since the 1980s, and our contemporary moment. Social media now also enables the promotion of illicit queer graffiti worldwide. The Tumblr site "Queer Graffiti" regularly posts images of graffiti of same-sex kissing, gender bending, and other queer imagery from over 140 countries.

**FILMOGRAPHY**

The Groupe du 6 novembre: lesbiennes issues du colonialisme, de l’esclavage et de l’immigration (6 November Group: Lesbians Begotten of/Out of Colonialism, Slavery, and Immigration) was the first heterogeneous autonomous self-declared lesbian of color group in contemporary France. It was founded in 1999 in Paris and remained primarily based there. It also operated more broadly in France—in the Parisian banlieues (suburban racialized working-class neighborhoods) and in other cities and banlieues. It formed links of solidarity with lesbians in France’s present and former colonies and with lesbians of color groups elsewhere in Europe and globally.

Unlike prior autonomous women of color groups in France, the members of the Groupe du 6 novembre did not come from one national, regional, or community background. Instead, they came together from many: Maghrebian, sub-Saharan African, Afro-Caribbean, Latin American, and racially mixed. The group was founded during a tumultuous political period for people of color in France. The founders converged at a national lesbian gathering in 1999, where it became apparent that lesbians of color, and questions of coloniality and racism, were not being taken seriously by most white lesbians. They created an autonomous space at the gathering and thereafter opened it to create the broader group (Bacchetta 2009).

The name Groupe du 6 novembre: lesbiennes issues du colonialisme, de l’esclavage et de l’immigration reveals quite a bit about the group’s political mandate. The first part refers to its founding date. It is not uncommon in France to use a specific date in names to mark the inauguration of a new politics that is present and simultaneously is yet to come. The group’s subtitle (Lesbians Begotten of/Out of Colonialism, Slavery, and Immigration) references a critical relationship to histories, bodies, and political geographies of the postcolonial world. The notion of “begotten of” evokes not only respect for ancestral lands but also the necessity and desire to “re-compose our own herstory” (Nedjmam 2001; translation by Paola Bacchetta).
Historical Emergence

Like many other postcolonial lesbian groups elsewhere, the genealogy of the Groupe du 6 novembre most accurately begins by recognizing that lesbians were among the many other activists in anticolonial movements (Bacchetta 2002). More recently, as France’s colonies began to win political independence, lesbians made their way to France as immigrants. The earliest postcolonial immigrants to France were men who entered the labor market at its lowest rungs, in factories. By the 1970s, the French state’s patriarchal and heterosexist “family regrouping” laws allowed women to enter in substantial numbers, but also made them legally dependent on male counterparts, thereby imposing conditions of sexism and lesbophobia (Bacchetta 2016).

The first lesbians who organized politically in autonomous women’s groups had previous experience in their national liberation movements or, in the case of Latin Americans, had fought against dictatorships organized and bolstered by US imperialism. An exception to this was the Coordination des Femmes Noires (Black Women’s Network), which organized by regional origin. Given this history and France’s policy of bilateral migration treaties with individual nations, it is not surprising that from the 1970s onward immigrant women first organized autonomously along country lines. Lesbians were among them.

During the 1980s, lesbians of color were active in the anti-racism, Beur (a term that signifies “Arab” in verlan, the language developed by youth of Arab origin in the workingclass racialized suburbs of French cities, and which is extended to signify people of color), and pro-immigration movements of the day. They did not yet organize autonomously as lesbians but instead tried to impose an intersectional perspective that would include all their struggles. For example, lesbians of color—of Maghrebian and racially mixed backgrounds, primarily—were among the cofounders of Collectif féministe contre le racisme et l’antisémitisme (Feminist Collective against Racism and Anti-Semitism), a coalitional collective created in 1984 at the Maison des Femmes de Paris (Paris Women’s Center). Some of the same lesbians, along with at least one in exile from Latin America, co-established the Lesbiennes contre le racisme, l’anti-sémitisme et le fascisme (Lesbian Collective against Racism, Anti-Semitism and Fascism) in 1985 at the Archives Lesbiennes (Lesbian Archives) in Paris. Just slightly prior to the creation of the Groupe du 6 novembre, a short-lived group called Les Négresses Sapphiques (Saffique Black Women) was formed. Then, in 1999, shortly after the Groupe du 6 novembre’s founding, another lesbian of color group, Madivine (a term for “lesbian” in Haitian Creole), was created mainly by Caribbean lesbians (Madivine 2000; Lesbiennes of Color 2016). Also in 2001, a group of Arab lesbians living in their countries or in exile in France created the N'DéesSses. In sum, this was a first crucial period for autonomous lesbian of color organizing.

Outside of the groups, during the 1980s and early 1990s, politicized lesbians of color met
informally to discuss their intersectional oppression and their relations with other movements. Some published essays and poetry on lesbianism and racism. Some of these ended up in a book created by the Groupe du 6 novembre, and some are collected, along with the texts produced by the autonomous groups, in the first anthology of writings from lesbian of color activism and creative practices in France.

**Activities**

The Groupe du 6 novembre held regular meetings, wrote collective and individual texts, organized cultural and political events, participated in conferences, and spoke on immigrant and alternative radio ([Doumia 2001](#)). It published on the following topics: how colonialism, slavery, racism, heterosexism, and lesbophobia operate together; survival; relations to dominant French lesbian, feminist, and anti-racist movements; links with lesbians across the globe; and transnational politics. It created a website to open the conversation among lesbians of color more broadly.

In 2000 the group worked to publish a special issue of a French Canadian lesbian journal. When its work was met with excessive editorial intervention, the group created its own publishing company: Nomades'Langues (Nomadic Languages and Languages Nomads). In 2001 Nomades'Langues published *Warriors/Guerrières*, a bilingual book of theoretical essays, personal narratives, poetry, and art by members and comrades. Arab lesbians in the group produced a special issue (no. 7) of the lesbian Arabic journal *Bint el nas*. Other group members organized a major exhibit in Paris by the black lesbian Italian artist Veruska. In 2001 the Groupe du 6 novembre showed up at the (white) lesbian conference on Monique Wittig in Paris, protesting that they had not been invited to speak. Members spoke out on immigrant and other alternative radio. In 2001 they went to the World Conference against Racism in Durban, South Africa, where they expanded their transnational connections with lesbians of color globally. After these years of intensive activities, the group met less often. However, members remained in touch and also stayed in the broader movements in which they had all been involved.

**BIBLIOGRAPHY**

Bacchetta, Paola. “Co-formations: Des spatialités de résistance décoloniales chez les lesbiennes ‘of color’ en France” [Co-formations: On decolonial spatialities of resistance by

The Grupo de Trabalho Homossexual (GTH; Homosexual Working Group) and LES—Grupo de Discussão sobre Questões Lésbicas (LES—Discussion Group on Lesbian Issues) were two associations that, in spite of a considerable time gap between their beginnings—1991 and 2008, respectively—were both intended to fill voids in the LGBTQ movement in Portugal. The former was created to address the pure and simple nonexistence of a LGBTQ movement in Portugal, while the latter intended to fill the absence of a proper discussion of lesbian matters in the already existent organizations, as well as in the public sphere at large. Although working separately, the two groups each sought to respond to the ongoing presence of homophobia in Portugal.

**Homosexual Working Group**

The GTH was created in May 1991 as a section of the Partido Socialista Revolucionário (PSR; Socialist Revolutionary Party), a small, Far Left Trotskyist organization that, for several years after the Portuguese democratic revolution of 25 April 1974, was the only group to openly support gay and lesbian rights (Santos 2013). The GTH resulted from an effort by some of its members, led by José Carlos Tavares, to organize autonomously and build up a proper LGBTQ agenda beyond the only too vague party proclamations, against the background of a virtually nonexistent LGBTQ movement at the time in Portugal, in spite of two ephemeral and fragile previous attempts: the Movimento Homossexual de Acção Revolucionária (Homosexual Movement of Revolutionary Action) in 1974 and the Colectivo de Homossexuais Revolucionários (Collective of Revolutionary Homosexuals) in 1980 (Almeida 2010; Cascais 2006).

Through press conferences and releases, regular participation in public debates, and interviews in the media, Tavares and the GTH’s public visibility played a crucial and pioneering role in the reframing of media representations of gay men and lesbian women, from a largely predominant homophobic/lesbophobic/transphobic frame, or a mere stereotypical and entertaining one (namely as transvestites), into a public interpretative frame of credibility and authoritativeness both as sources and vocal subjects. In addition,
the GTH played a pioneering role as an interlocutor between the LGBTQ community and the media, political parties, the government, organized churches, trade unions, the medical and psychiatric establishment, and nongovernmental organizations fighting the AIDS epidemic. The GTH founding manifesto included a call for the legal recognition of same-sex unions (implemented in 2001 and followed by a same-sex marriage law in 2010), adoption rights (formally recognized only in 2016) and medically assisted procreation for (either single or married) lesbian women (yet to be approved as of 2017), and nondiscrimination on the grounds of sexual orientation (added to Portugal’s constitution in 2004). The public presentation of the manifesto took place in a May 1992 meeting titled “A Ousadia de Quem Sabe o Que Quer” (The daring of knowing what you want).

Soon after, in June 1992, the first national celebration of Pride Day took place and a debate titled “Homosexuality and AIDS” was held to counter the underrepresentation of health and social rights of gay men in the nongovernmental organizations that at the time were struggling against the epidemic. At the 1993 Labor Day National Parade, the GTH became the first Portuguese LGBTQ association to join in a public demonstration. In 1997 the GTH was a co-organizer, with other LGBTQ associations, with which it shared prominence starting in 1995, of the first national Pride Parade, as well as the national pride party Arraial Pride. In 2002, to mark its tenth anniversary, the GTH held an international meeting titled “To Fight Loving, to Love Fighting,” an unprecedented gathering of activists (including Peter Tatchell, Peter Drucker, and Terry Conway) and academics (including Miguel Vale de Almeida, the future spokesperson for the same-sex marriage law in the parliament). A declaration of principles issued at the time restated that the GTH was an anticapitalist association that saw the LGBTQ movement as a liberation struggle of long-oppressed groups envisaging the revolutionary changing of society where homophobic, xenophobic, racist, and sexist segregation would be eradicated, along with all economic exploitation. The risk of homonormativity and the commodifying effects of the “pink market,” heterosexism, and transphobia, as well as ableism and ageism (even inside the LGBTQ communities), were also mentioned, and a special emphasis was put on criticizing gradualist and assimilationist, or unity-at-all-costs, LGBTQ politics. The declaration stressed, furthermore, that the fight against discrimination and the stigmatizing of LGBTQ persons and HIV positives lacked efficaciousness if it overlooked class inequalities.

From 1999 to 2002 a fanzine was published titled *Sem medos* (No fears). The GTH remained active under that name until 2003. When the PSR merged into a new political coalition, the Bloco de Esquerda (Left Bloc), former members of the GTH gathered around Sérgio Vitorino, a young and prominent activist who already had replaced Tavares in the leadership, and formed a homosexual wing of the Bloco de Esquerda. A short-lived organization, it evolved into the Panteras Rosa (Pink Panthers, inspired by the French/Belgian/Canadian Les Panthères Rose), which, with an uncompromising anti-assimilationist agenda (*Santos 2013*), presents itself as a direct heir to the political legacy and radical spirits of the former GTH.
LES—Discussion Group on Lesbian Issues

LES (short for “lesbian”) started as a discussion group on lesbian issues in early 2008, under the initiative of Eduarda Ferreira, a member of Clube Safo, the already existing major nationwide lesbian association. Completely nonaligned with the latter, however, LES purported to bridge the gap between lesbian activism and academic reflection and research on lesbian issues by gathering both activists and scholars in an environment that was self-standing and autonomous from the constraints of either academe or activism, while not shying away from scrutinizing and debating the relations between the two: “The main objective of LES is the reflection, broadcasting, and publication of opinions, researches, and inquiries on lesbian issues, as well as the development of thematic discussions” (Ferreira and Silva 2010, 55; translated by author).

The need for such a discussion group derived from a widespread perception in Portuguese lesbian organizations, among Portuguese lesbian scholars, and within the lesbian community in Portugal at large of the prevailing sexism within LGBTQ associations (Ferreira and Silva 2010; Santos 2009): “These associations invariably reproduce patterns of the societal context in which they exist; sexism and male dominance, therefore, are a pervasive reality even within LGBT organizations. Specific lesbian issues are, for example, rarely afforded the same prominence as gay issues” (Ferreira 2014, 63). In spite of the existence of a consistent and sustainable lesbian activism in Portugal since the mid-1990s, lesbian invisibility was an insurmountable issue from the inception of the Portuguese LGBTQ movement and remained so. According to Ferreira (2014), this was the unsought consequence of the increasing assimilation of lesbian collective action into the movement, which was born and gained momentum in the context of the fight against AIDS, always awarding prominence to gay issues and thus tending to dilute the opportunities for lesbian interaction and the overt expression of the specific needs and demands of lesbians.

Fully cognizant of its limited public outreach and committed to raising awareness of this fact in the movement at large, LES in December 2009 launched LES Online: Digital Journal on Lesbian Issues, an online journal that aimed to “promote scientific research, as well as intervention projects and opinion pieces related to various lesbian issues” (Ferreira 2014, 61). In fact, and although it gave priority to lesbian matters, LES Online became a lot more than that, being the only journal in the area of lesbian, gay, and queer studies that ever existed in the country, with a far greater reach than the discussion group from which it originated. A bilingual publication (English, as well as the article’s original language of either Portuguese, Spanish, or French), LES Online emphasizes the situatedness of all knowledge, which leads to a necessary recognition of the importance of the specific embodied locations of the researcher—that is, his or her self-reflexive positionality, in sharp contrast to false notions of neutrality. Its first editorial notes the diversity of women who engage in sexual/emotional relationships with other women, as well as their social
and psychological experiences, expectations, fears, and anxieties, clearly asserting that these women suffer with

the lack of specific approaches to [their] realities that included strongly diverse socio-economical, political and psychological dimensions.

We believe that those different dimensions create a specific landscape that is not completely addressable and understandable by using a feminist or LGBT analysis. This question is the starting point of LES Online.

(EDITORIAL TEAM 2009, 2)

Over the course of seven years (2009–2016), ten issues of the journal were published, with seventy-one pieces, comprising scientific essays, book reviews, and narratives about personal experiences of women engaged in the LGBTQ movement. Raquel Lucas Platero, Ana Cristina Santos, São José Almeida, Ana Maria Brandão, Ana Luísa Amaral, Maria José Magalhães, and Maria do Mar Pereira were some of the most prominent contributors, among many more from Portugal, Brazil, Italy, Spain, France, the United Kingdom, Austria, Poland, Cameroon, Senegal, Canada, Australia, Mexico, and Argentina. Most issues were thematic: “Lesbian Issues” (vol. 1, no. 1, 2009), “Lesbian (In) visibility” (vol. 2, no. 1, 2010), “Lesbianism and Education” (vol. 2, no. 2, 2010), “Activism and Academia: Intersections, Conflicts and Potentialities” (vol. 3, no. 1, 2011), “Lesbian Citizenship” (vol. 7, no. 2, 2015), and “Intersections of Gender and Sexual Orientation” (vol. 4, no. 1, 2012; vol. 5, no. 1, 2013; vol. 7, no. 1, 2015; and vol. 8, no. 1, 2016). On the grounds of a scarcity of researchers specifically concentrating on lesbian issues and the pressure to privilege publishing in indexed journals, LES Online in 2017 merged into the Revista Latino-Americana de Geografia e Gênero (Latin American journal of geography and gender).

Brazilian organization for LGBTTQI activism.

The Grupo Gay da Bahia (GGB; Gay Group of Bahia) is a nonprofit organization in Salvador, Bahia, that has been a leader in the fight for LGBTTQI (lesbian, gay, bisexual, travesti, transsexual, queer, and intersexual) rights in Brazil, mainly in the 1980s and 1990s. It is also one of the pioneer institutions in the implementation of AIDS control and prevention policies. The GGB has acted politically with the Brazilian government agencies, demanding civil rights such as same-sex civil unions and the implementation of inclusive education policies for the LGBTTQI population. During the long period of the group's activity on behalf of the Brazilian LGBTTQI population, it has operated with the following objectives:

1. to defend the interests of the LGBTTQI community in Bahia and in Brazil, denouncing and demanding action against all LGBTTQI-phobic expressions;
2. to disseminate information about homosexual orientation in order to deconstruct deeply rooted social prejudice;
3. to prevent the spread of HIV/AIDS within the community and other groups that are equally vulnerable to this disease;
4. to create proposals for legal tools to guarantee equal rights to sexual minorities and put pressure on politicians to approve such laws; and
5. to raise awareness of the urgent need to fight for full citizenship rights for LGBTTQI groups.

The GGB was founded in 1980 during the Brazilian military dictatorship (1964–1985) by Luiz Mott (1946–), a gay activist and anthropologist who is a professor at the Universidade Federal da Bahia (Federal University of Bahia). In the late 1970s several social organizations involved in the fight against the dictatorship also sought better working conditions and other citizens' rights. Organizations such as SOMOS (We Are), founded in 1978, were established during this period of increased social activism in Brazil (Simões and Facchini 2009). The important newspaper Lampião da esquina (Oil lamp on the corner)
Grupo Dignidade 2018, which was also launched during this period, gave visibility to homosexual culture at a time when public debates on (homo) sexualities were controversial (Green 1999, 2003). The GGB followed this trend, emerging as a dissenting voice in the context of a Brazilian society marked by the heritage of slavery and the ever-present legacies of colonialism and its attendant racial and social hierarchies that promote the deepening of homophobia, transphobia, and misogyny.

The GGB’s active role in the Brazilian LGBTTQI political scene is strongly linked to Mott’s political action and his well-known intellectual production. Mott’s work can be grouped around three themes: (1) homosexuality and AIDS (the subject of numerous books, chapters, and papers in journals in Brazil and abroad); (2) the Inquisition (a singular aspect of his work as a pioneer in the historical research of persecution of homosexuals during the Portuguese Inquisition, and the late sixteenth-century inquisitorial visitations to colonial Brazil); and (3) Afro-Brazilians, indigenous peoples, and the institutions of slavery and coercive labor in colonial Brazil (with an intersectional perspective on the discussions involving race, sexuality, and ethnicity, long before this debate became a trend in Brazil). Mott’s work on the Portuguese Inquisition (1536–1821) and homosexuality is the most outstanding of his scholarship (Mott 2003, 2007, 2008). His thorough survey of processes in the repression of sodomites in Portugal and in colonial Brazil made visible 200 “homosexuals” in Bahia who were judged by the Portuguese Holy Office between the sixteenth and nineteenth centuries, including the “lesbian” Felipa de Souza (1556–1600), after whom the main homosexual human rights international award was named; it is awarded by OutRight Action International (formerly known as the International Gay and Lesbian Human Rights Commission) of San Francisco, California. Mott also revealed the judgment by the Holy Office of the Inquisition of Francisco Manicongo in 1591, who according to the records was a man who wore women’s clothes. The Associação das Travestis e Transexuais do Estado do RJ (Association of Travestis and Transsexuals of the State of Rio de Janeiro) named its human rights award Xica Manicongo, using a female version of his name to honor her identity as a travesti (a female transgender identity that corresponds to a person who identifies with a different gender than that one assigned when she was born. They may or may not proceed with hormone therapy. The word travesti remains popular in Latin American in association with the historic, social and political struggles faced by that community so that the translation loses the specificity of their process of identification).

**GGB’s Contributions**

The GGB’s success in the fight for LGBTTQI rights in Brazil is mostly due its leaders’ ability to implement strategies in different social and economic contexts during the period of restructuring democracy. The early twenty-first century saw the broadening of discussions about civic freedom and sexual rights, a rise in the number of institutions of the organized
civil society, and an elaboration of the movement for sexual rights, highlighting an increase in the number of subjects that became empowered and started to produce specific demands for lesbians, travestis, and transsexual people (Parker [1991] 2009).

The GGB in the 1980s and 1990s was an important organizer of the political forces at the national and regional levels. At the national level, the institution acted together with thirty other institutions to found in 1995 the Associação Brasileira de Gays, Lésbicas, e Travestis (ABGLT; Brazilian Association of Gays, Lesbians, and Travestis), which had grown to some 300 affiliated organizations by 2018 (ABGLT 2018). In addition, it supported the opening of new LGBTQI organizations in different regions of Brazil, mainly in the northeast. Regionally, the GGB was instrumental in the foundation of the Fórum Baiano de ONGs/AIDS (Bahian NGO/AIDS Forum) and the Fórum Baiano de Grupos LGBT (Bahian Forum of LGBT Groups). Starting in 1995 the GGB began to organize the gay pride parade in Salvador, Bahia, for which over half a million demonstrators assemble on the second Sunday of September every year.

In addition to acting within these networks, the GGB gradually became an umbrella institution in the 1990s, supporting other groups that wanted to set specific agendas and demands, including lesbians, travestis, and trans individuals. According to Mott (in a 2018 interview), these different groups organize themselves autonomously and have the institutional support of GGB to combat homophobia and engage in HIV/AIDS prevention. They include the Centro Baiano Anti-AIDS (Bahian Anti-AIDS Center), the Grupo Gay Negro da Bahia Quimbanda Dudu (Quimbanda Dudu Black Gay Group of Bahia), and the Associação de Travestis de Salvador (Travesti Association of Salvador). These entities keep their independence and at the same time are meaningfully linked to the GGB in order to combat prejudice against sexual diversity of all types, in Brazil and elsewhere.

Two projects in particular demanded intense efforts from the GGB to develop LGBTQI policies in Brazil. The first resulted in the depathologization of homosexuality in 1985 by the Conselho Federal de Medicina (Federal Council of Medicine) after a powerful campaign headed by the GGB and aligned organizations and entities. The second fundamental contribution of the GGB was the creation and maintenance of annual reports since 2000 about lethal gender-based, homophobic, and transphobic violence involving the LGBTQI population throughout Brazil (Grupo Gay da Bahia 2018). Because the Brazilian government does not provide such information, the statistical records and annual reports developed and disseminated by GGB have been a vital source of data for analysis and academic scholarship in favor of criminalizing various forms of homophobic and transphobic violence in Brazil. The group’s database is accessible for online inquiries and includes information about homicides and suicides among the LGBTQI population, based on reports submitted to the GGB website as well as articles published in newspapers. The publication of these annual reports has brought to the attention of Brazilian society (and, to a lesser extent, local politicians) the quotidian violence suffered by the LGBTQI
population.

**Key Advances and Controversies**

The GGB and its leader Mott are indispensable actors in the development of the LGBTTQI movement in Brazil and the attainment of civil rights. Mott's legacy of scholarship on the history of sodomy and “homosexuality” during the Inquisition in Brazil and Portugal is invaluable, mainly for giving visibility to the victims of the Inquisition courts from the late sixteenth to the early nineteenth centuries. Yet, several historians have criticized Mott for his interpretation of this history and his unequivocal assertion that “gays” and “homosexuals” (using nineteenth- and twentieth-century categories of identity) inhabited the early modern Lusophone world. Alécio Nunes Fernandes, for example, claims that in the historiographic interpretation by Mott and others, “An inversion is promoted: those accused of crimes in other times are placed in the category of victims of the inquisitorial injustice and arbitrariness committed by the Holy Office [of the Inquisition], and the Court, due to such injustice and arbitrariness, becomes the party accused of crimes against human rights” (2012, 34; translation by Kaciano Gadelha and Joseli Maria Silva). According to Fernandes (2012), Mott views history through the lens of the present, ascribing to the past views and beliefs (and categories of identity) that would not have existed in that particular time period (Tortorici 2012).

Initiatives in many parts of the country have adopted broader issues such as the fight against exploitation and inequalities. The intersectionalities between dissident sexualities, race, and poverty became important agendas for the LGBTTQI movements in the first decade of the twenty-first century, and they are intertwined with the deep political-institutional crisis that divided the Brazilian society into leftists and rightists, peaking with the 2016 impeachment of Brazil’s president, Dilma Rousseff of the Partido dos Trabalhadores (PT; Labor Party). Mott openly declared his support for the impeachment (Junior and Aguiar 2016), while the ABGLT released an official statement opposing it. The ABGLT believed that the impeachment was a strategy adopted by conservative elites aiming to take over the government and implement their neoliberal project in Brazil, and attacking the democratic state under the rule of law. The close relationship between the GGB and Mott, its founder and permanent “honorary president,” fueled tensions between the GGB and LGBT activists linked to left-wing parties. Mott claimed that the university and the LGBT movement had been co-opted by PT and their allies and complained of suffering retaliation from his colleagues due to his political position, construed by activists as rightist and neoliberal (Junior and Aguiar 2016).

The GGB’s pioneering work in the formation of LGBTTQI political activism in Brazil and its active role in several civil rights achievements are of great importance. In addition, its actions on behalf of other groups that have specific demands such as travestis, trans people, and lesbians and its support of emerging groups are relevant strategies for its own survival.
and for the creation of broader alliances that strengthen the groups and the LGTBTTQI population as a whole. However, GGB will face new challenges as the LGTBTTQI fight becomes more complex, addressing categories of resistance that encompass the different intersectional oppressions that mark gender and sexually dissenting bodies: cis/heteronormativity, white privilege in social relations, and ableism (De la Dehesa 2010; Gavério 2015; Siqueira 2016).

Mott, Luiz. Interview with Kaciano Gadelha and Joseli Maria Silva, 14 April 2018.

The Lebanese author Hoda Barakat (1952–) is considered the first contemporary Arab writer (among both men and women) to employ a homosexual man, Khalil, as the main character of a novel. In the context of her renowned first novel Hajar al-dahik (1990; The Stone of Laughter [1995]), Barakat carefully traces the traumatic impact of Khalil’s sexual self-discovery using an invisible genderless narrator who is declared to be a woman only in the last three lines of the novel. Khalil’s struggle with his newly awakened homoerotic desires develops during the violence of the Lebanese Civil War (1975–1990) and culminates in his final moral decline and degradation. This is portrayed through the hypermasculine acts of raping a woman and becoming a warlord and an arms dealer. The title of the novel is a take on the philosopher’s stone, a legendary alchemical substance believed to be capable of turning base metal into gold. The author employs this metaphor to exhibit Khalil’s gradual transformation from a marginalized figure in the war to an active participant in and perpetuator of the conflict.

**War, Violence, and Masculinity**

Barakat’s war literature revolves mainly around marginalized male antiheroes struggling to cope with the violence surrounding them. Her oeuvre can be read as a detailed account of the forms of masculinities set against the unraveling social and national paradigms of war-torn Lebanon. At the outset of Hajar al-dahik, the author delineates two types of hegemonic patriarchal masculinities. The first type looks like Khalil and is “made up of youths a lot younger than [him], who have broken down the door of conventional masculinity and entered manhood by the wide door of history.” These young men, Barakat continues, “busy themselves shaping the destiny of an area of patent importance on the world map, concerned of people’s public and private lives ... with bread, with water, with emigration” (Barakat 1995, 12). This type of masculinity is portrayed through the character of Youssef, Khalil’s younger cousin, whose family seeks refuge in Khalil’s building when they have to flee their home in the south of Lebanon because of Israeli bombing. Soon after settling in the flat upstairs, Youssef assumes such manly tasks: “Now I’ve become a man and I can’t ignore things,” Youssef tells Khalil as he starts meeting the needs of his family (103).
The second group is made up of men who do not look like Khalil although they are his age. These men “have got a grip on the important things in life, and who, holding the tools of understanding, awareness, and close attention to theory have laid down plans to fasten their hold on the upper echelons ... in politics, in leadership, in the press” (12). This type is portrayed in characters such as Khalil’s college-mate Nayif and his comrade Said; both are affiliated with a political party and fervently discuss politics, and whose invitation to join their party Khalil declines politely. For Khalil, the manhood of this second group is shown in their ability to “demonstrate” because they understand politics, “and no one understands politics but men” (100).

In opposition to these two types of hypermasculine virile men who perpetuate violence and conflict, Khalil’s masculinity is represented as different and ambiguous in its androgynous and/or feminized tendencies. Alienated from hegemonic masculinity, yet still insensible of his homosexual inclinations, Khalil finds “the doors of both kinds of manhood ... closed” to him, and he thus becomes trapped “alone in his narrow passing place, in a stagnant, feminine state of submission to a purely vegetable life, just within reach of two very attractive versions of masculinity, the force that makes the volcano of life explode” (12).

Lebanese author Hoda Barakat in 2012. Barakat became the first contemporary Arab writer to employ a homosexual protagonist when she created the character of Khalil for her renowned first novel Hajar al-dahik (1990).
Mona Fayad considers Khalil’s positionality as destabilizing to the only two options presented by the author. Fayad maintains that “by placing him in the corridor between passivity and explosive activity, the narrator presents his condition as a suspension of identity rather than as a space in which identity can be formulated” (2002, 168). It is, then, only al-Akh (the Brother), a warlord who courts Khalil, who “has the power to open for Khalil the gates to one of those ‘manhoods’ that seemed out of reach, specifically that of men who bear responsibilities” (Lagrange 2006, 185).

Gender Polarity

From the outset of the novel, Barakat’s employment of a genderless narrator to recount the story of a marginalized gay man underlines the gender polarity of the novel. This gender dialectic is demonstrated in Khalil’s reluctance to identify with this gendered world. He thus finds refuge in his pregendered self:

*His voice which fell, as if into his light testicles, said to him from below that he was of a certain sex and he was of a certain age and that his sex and his age had begun the outward journey.... With this high cadence that was lost for ever was lost the delight at being outside sex, it abandoned Khalil before he knew which string he would play to compensate for this loss.*

*(BARAKAT 1995, 142)*

Therefore, Khalil seeks refuge in the feminine from the war carried by hostile masculinities. Throughout the novel, Barakat deliberately recounts Khalil’s feminine attributes. These include domestic activities, excessive cleaning, grocery shopping, cooking, knitting, and waiting for and following other men (Naji and later Youssef). *Hajar al-dahik* opens with a scene in which Khalil is chasing after his friend and neighbor Naji, “panting” as he tries to catch up to his first love (who was a double agent during the war and subsequently was killed by a sniper from East Beirut before Khalil had had the opportunity to act on his feelings). A few pages later, the narrator describes how whenever “a battle draws to an end, Khalil feels the need for order and cleanliness and the feeling grows, spreads until it becomes almost an obsession”; this cleanliness “suggests that a woman, a housewife—or a snow-white old maid—has lived for some time quietly in this little house” (9–10). As he waits for Naji’s visits, Khalil is “disgusted at the way he behaves as a plumb divorcee” (23). Later, he thinks of himself as “an old hen” waiting for Youssef “clutching the egg of [her] dreams” (105) and as Youssef’s “wife of the wrong sex” (115).

As Khalil escapes the reality of the war by indulging in domestic duties, he is aware that “a
fear of blood to the point of faintness, having short legs, a slight built, straight chestnut hair and large eyes, all these do not make a man a hermaphrodite, or effeminate, or make him any less masculine, or ... queer.” Still unable to choose one side or the other, Khalil assures himself that “the temporary breakdown that he was suffering was only a psychological crisis that the mad world outside had imposed upon him.... He knew that there were certainly more female hormones in him than there should naturally be, for they protected him from committing the crime of the act.” Yet again, his awareness yields to the passive feminine as he mournfully reminds himself “Naji is dead” (75).

Samira Aghacy reads Khalil’s reactions to violence and war along the lines of “feminized positionality” (2009, 137). She characterizes him during war as “insecure, humiliated, incarcerated, and tortured” (135) and concludes that he is a “weak male” who manages “the changes beleaguering men like himself” by “giving in to effeminate tendencies and articulating his desire for men rather than women” (131). Kifah Hanna contests such a characterization, as it domesticates Khalil’s homosexuality and consequently “undercuts the sense of homosexuality as a form of masculinity alternative to that of the heteronormative”; it “also forecloses the possibility of androgyny as that which precedes socially imposed categorizations of gender and sexuality” (2016, 120).

Controversy and Criticism

Upon its publication, *Hajar al-dahik* won the prestigious al-Naqid Award for a first novel. Shortly after the release of its first English translation in 1995, the novel claimed international recognition as one of the best works of fiction written about the Lebanese Civil War. Despite this recognition, *Hajar al-dahik* received only sporadic, yet favorable, attention among Arab critics. Although Barakat acknowledges the generosity of critics, she explicitly contested their readings of Khalil’s character in a 2014 article published in *al-Akhbar* newspaper:

Some of the criticism went almost in the opposite direction of the content of the novel. At first, I thought it was lack of professional experience on my part that made critics miss my point to the extent of praising a piece of writing that was meant to be condemned. Then I decided to consider myself “not understood” because of the uniqueness and novelty of my “pioneering” writing. To create an Arab gay man, and take his side, making his pains and estrangement a shield to ward off social and religious criticism and a tool to grant him innocence of sexual deviance ... all of this in addition to other literary “considerations” was not easy to accept. Then with a little humility I started thinking that before this novel nobody had heard of my existence altogether, from the ocean to the gulf, and that I should be happy with it. So I became happy with it.
Furthermore, the author states that her placement of a gay man at the heart of her novel is “not shocking because he narrates a real sentiment of love.” Conscious of the provocative nature of her subject matter, the author used “a passage from the Qur’an” every time she described “how much he is in love and how much he suffers and the beauty of the other [man]” (quoted in Whitaker 2006, 99). This literary aptitude, according to Brian Whitaker, “has the potential to inflame religious sensibilities” (2006, 98–99). Barakat, however, dodges such a possibility by taking “the reader slowly ... step by step, from the feeling, not in a sexy or a shocking way” (quoted in Whitaker 2006, 99). Despite such authorial techniques, Khalil’s character has usually been desexualized and read either in terms of what Aghacy calls his “feminized positionality,” as mentioned previously, or in terms of what Fayad calls his “strategic androgyny” (2002, 162). Fayad argues that by “refusing to become one [male] or the other [female], Khalil resists gender as a vector of power” (169).
Hanna (2016) maintains that such a reception of Khalil's character among critics gives insights into the limitations of the current critical discourse on homosexuality in contemporary Arabic literature and the need for a reinvigoration.

**Homosexual Self-Discovery**

Whatever the resulting attitude of the critical establishment toward the novel, it seems that Barakat’s aversion to shock for its own sake, or for publicity, is genuine, and her real intention is to portray the gradual unfolding of homosexual desire and love with a sensitivity and sophistication that these have rarely been afforded in contemporary Arabic literature. This is exhibited in the numerous homoerotic scenes that narrate Khalil’s sexual self-discovery. Khalil’s homoerotic desires first surface in a dream scenario where Rafat, a man he knows only by voice from his calls to a nightly radio program, seduces him:

> Khalil leaned back against the thick tree trunk…. Rafat came close to Khalil and pushed back a long strand of hair that was fluttering across his face. Khalil looked shyly at his legs…. He was more sure that he was beautiful and ready for love. Rafat brought his hand down to Khalil's neck, where the hair grows thick and, panting loudly, brought his eyes and lips close to his face.

*(BARAKAT 1995, 68)*

It soon becomes clear that Rafat is a displacement figure for Naji. Rafat metamorphoses into Naji, and the dream ends with Khalil bringing the image of his deceased beloved back to life in a sexual wish-fulfillment fantasy:

>Khalil saw Naji looking at him, his eyes red, his face distorted in anger…. Khalil was trembling, but not out of fear. Naji took hold of Khalil’s collar and tugged at it, pulling the buttons off his shirt as he tore it open down to the navel. Naji took a step backwards and smoothed down his hair with his hand, then slowly came close again, stretching out his hand to pull Khalil’s leather belt undone.

*(69)*

When Khalil wakes up he “found himself standing next to his bed … drowning in his cold
sweat and his pajama bottoms were clinging between his thighs,” and, as he recollects his
dream, he succumbs to “a flood of tears” (69). While these tears can be read in line with
Khalil’s lamentation for his unfulfilled desires, their “more fundamental cause,” Hanna
argues, “is the realization of these desires itself, inevitably traumatic in a society that
conditions its subjects into believing they are immoral, obscene, and unmanly” (2016, 106).
Hanadi Al-Samman asserts that by focusing on Khalil’s homoerotic desire, Barakat locates
such desire “in his biological genetic make-up,” in contrast with other representations of
homoerotic desire in Arabic literature of the 1990s that locate “the essence of
homosexuality in deviant social practices, poverty, local/colonial violations, and/or child
abuse” (2008, 294).

In addition to the elaborative narration of her marginalized antihero’s homoerotic desire,
Barakat hinges her novel on the concept of difference. “He is different,” Khalil contemplates
in an interior monologue. “If not, then how to explain the blazing of his lust when he sees
the corpses of the men who have been killed in the newspapers, the men whose torsos are
always exposed. He feels that excitement that goes directly from his lungs to his loins”
(Barakat 1995, 144). Aghacy reads Khalil’s “necrophilic attraction to corpses” as a way to
compensate for his “sexual frustration and his fear of having sex with men” (2009, 137).
Hanna reads Khalil’s “difference” in line with anti-identitarian aspects of queer theory and
concludes that with such literary aptitude, Barakat “may very well have ushered in the era
of Arabic queer literature” (2017, 391).

**Masculine Masquerade**

Khalil’s awareness of his homoerotic desire and the ensuing difference is the first step in
his transformation “into forced pseudo masculinity” (al-Samman 2008, 296). This change is
enunciated through an encounter with his own body on the operation table to remove an
ulcer that could have possibly threatened his life if left untreated. Fayad reflects on Khalil’s
transformation as a struggle “between resisting his rebirth and accepting it at the hands of
Dr. Waddah, who becomes a surrogate male mother” (2002, 175). After the successful
surgery, Khalil’s fluctuation between both sexes comes to an end with a strong desire to
“learn a new alphabet with which to love himself” and his new body (Barakat 1995, 175).
He assures himself: “Nothing is pure save love of the body. No one who has not lost it can
love his body. Who loses it, cannot. He dies” (168). This newly found love for his “beautiful
body” (171) brings Khalil’s fluctuation in the intersexed space to an end with the triumph
of the masculine over the feminine, violence over peace. And thus Khalil transforms from
the feminine passive homosexual man into the assertive warlord and arms dealer who
rapes his upstairs neighbor, a single mother who remains anonymous, and who reminds
him of himself. Frédéric Lagrange asserts that Khalil’s act of rape does not turn him into a
straight man: “The narrator does not equate homosexuality with passiveness; she equates
*fémininity* (under the circumstances of civil war) with passiveness. Khalil’s renouncement
of femininity is not necessarily a renouncement of his attraction to other men, but the narrator’s beloved character has simply become ... a violent monster she fails to condemn” (2006, 185). AlSamman contends that Khalil’s demonstration of “masculine dominance” through the violent act of rape “sadly indicates his detachment from his old feminine self, the termination of the alternative space that he created for his sexual identity, and his embrace of the rhetoric of violence” (2008, 296).

And, thus, having become the “perfect ‘masculine’ subject” (Fayad 2002, 165), Khalil seems “broad-shouldered in his brown leather jacket” and is left “rising upwards” into the ether while the narrator, now revealed to be, like Barakat, a woman, is consigned the responsibility of writing his disappearance: “And I remain a woman who writes” (Barakat 1995, 209). This ending stipulates the literal and figurative disappearance of Khalil. As significant as his presence, Khalil’s absence, according to Hanna, “marks out a space for the as-yet-unrealizable liberation of gender and sexuality in the Levant, and in the wider world” (2016, 114). “Khalil is gone,” Barakat laments about her hero. “He has become a man who laughs” (1995, 209). This laughter, Al-Samman asserts, “is not that of happiness, but that of death and destruction” (2008, 296). As long as war’s essentialist rhetoric continues to dominate the national construct, Al-Samman concludes, “there is no space left in the national discourse for an alternative homosexual identity” (296).

Halat Shaghaf (1998; Nihad Sirees)

MAX WEISS
Associate Professor of History and Near Eastern Studies
Princeton University, Princeton, NJ

A Syrian novel that includes the story of a collective of women who offer an alternative to normative heterosexuality during the 1930s in Aleppo.

Nihad Sirees (1950–) is a Syrian novelist and television writer from Aleppo. He was trained as a civil engineer and ran a private engineering firm for many years. He then went on to write seven novels as well as a number of plays, television dramas (musalsalat), and children's dramas. Amid the chaos and uncertainty of the Syrian uprising-cum-civil war, Sirees left Syria in 2012 and eventually settled in Berlin.

The Fiction of Nihad Sirees

Much of Sirees's fiction is historical, dealing with various aspects of modern Syrian history, culture, and politics. His 1993 novel Riyah al-shamal (The north winds) was concerned with the emergence of Syrian national identity around the time of World War I. His 2005 novel Khan alharir (The silk market), which is set against the backdrop of the tumultuous Arab nationalist politics of Aleppo during the 1950s and 1960s, was adapted into a highly successful television series. Most of his novels provide a particularly Aleppan slant on Syrian history and identity.

His fiction is also political. Al-samt wa-al-sakhab (The Silence and the Roar [2013]), published in 2004 in Beirut, was banned by the Syrian regime. Until 2017 it was his only work to be translated into several European languages. The novel achieved widespread acclaim for its humane and humorous depiction of life under authoritarian dictatorship in a country not unlike Syria, although the country is never named. The protagonist of that novel, Fathi Sheen, is a down-and-out writer who has fallen out of favor with “the regime.” After his ID card is confiscated by the security services, Fathi is forced to descend into the bowels of the bureaucracy in order to reclaim his identity. Along the way, the reader is offered a window into the horror but also the absurdity of living in such conditions. His relationships with his girlfriend and his mother also raise issues of intimacy and gender norms. The romantic and sex lives of Fathi and his mother are discussed in a frank manner that does not resort to Orientalist stereotypes.
Syrian Novelist Nihad Sirees. In his 1998 novel Halat shaghaf (States of Passion [2018]), Sirees engages with modern Syrian history and politics while also delving into less well-known aspects of Syrian and Arab culture.

States of Passion and the Banat al-ʿishreh

In his 1998 novel Halat shaghaf (States of Passion [2018]), Sirees maintains his engagement with modern Syrian history and politics while also delving into less well-known aspects of Syrian and Arab culture. The plot of the novel is fairly straightforward. A government bureaucrat from Aleppo is out conducting an agricultural survey in the countryside when his team's car breaks down in the middle of some inclement weather. This first-person narrator sets out to find help, but after getting lost in the wilderness and the elements, he finds himself at a mysterious house where he is welcomed and hosted by an old man named Nafeh and his young servant Ismail. Apparently, the old man has been holed up in this remote villa for some time, and he is starved for human contact. Therefore, he seizes this opportunity to tell the wayward traveler his life story, which then also transports the reader back in time. This portion of the narrative, told from the perspective of the old man, starts in the 1930s during the heyday of the French Mandate colonial government over Syria.

Although the novel's primary protagonist and the reader are unaware of the significance of
the characters when they are first presented, the story gradually appears to have something to do with Nafeh and Ismail. The tale begins with a young woman named Widad, who travels around Turkey and the lands of Greater Syria against the backdrop of the displacement and turmoil of World War I. On her deathbed, Widad's mother sends her to the house of an old friend in Aleppo. What Widad and the reader discover in that house becomes one of the main plotlines of the novel.

The house is overseen by a khojah, which might be translated as “madam” or “mistress.” The sprawling traditional house overseen and managed by the khojah is the residence of a number of women, all of whom are musicians and performers. They live together in an intimate setting that has a somewhat ambiguous status. Eventually, the protagonist and the reader are introduced to the world of the banat al-ʿishreh, a well-attested subculture in Syria and other parts of the Arab world. Banat means “girls,” but the term ʿishreh is somewhat difficult to translate into English. It literally means “intimate association” or “befriending” or “comingling.” In this sense, a loose conceptual translation of banat alʿishreh might be “affiliated girls” or “conjugal girls,” but the nature of the relationships in this house—and the houses of other khojahs with whom Widad’s khojah has both cooperative and competitive relationships—might also be thought of in terms of lesbianism. Broadly speaking, these are women who prefer the company of other ladies and girls, and they may or may not have sexual relationships with one another. In this regard, it is useful to borrow the analytical language of theorists of gender and sexuality, such as Eve Kosofsky Sedgwick, in order to recognize “the continuum of male or female homosocial desire” (Sedgwick 1990, 88).

The banat al-ʿishreh play a central role in the plot of the novel, and the living arrangement Widad discovers in the household of her mother’s friend offers a means of escape from the normative heterosexuality of Syria at the time. One reason that Widad’s mother sent her there in the first place, the reader finds, is that she is convinced that men are nothing but trouble and that men cannot possibly respect women in a relationship. Therefore, Widad’s mother believes that her daughter is better off in the care of her old friend, the khojah, than with one of the many male suitors who had come calling.

But this house is not simply a lone lesbian collective in the city. It is a node within a broader network of “women’s houses” that constitute a veritable community of lovers, friends, and performers. The women Widad meets in this particular house are musicians and dancers, and they perform at weddings and private parties throughout Aleppo high society. It is in this context that Widad happens to meet a man, and we soon discover that this man is Nafeh, the very same old man at the isolated house telling the story to the novel’s protagonist. The relationship that unfolds between Nafeh and Widad becomes a source of passion, drama, and tension for the remainder of the story. The scenes of dance and musical performance convey the emotional impact of the expressive arts in the everyday life of Syrian society.
From this point, the protagonist is mesmerized, and he is determined not to leave the house until he has heard the entire story of Nafeh and Widad, right down to the last detail. The protagonist is intrigued by the great secrecy and intrigue surrounding the circumstances of how Nafeh and Ismail wound up living in their isolation. The secret at the heart of the story leads Ismail to threaten the protagonist that he should be careful not to overstay his welcome and hear too much of the story, lest something very bad happen to him. The narrative has a somewhat predictable but satisfying plot twist that sustains the plot until the end of the novel.

**A Reflection on Friendship and Family in Modern Syria**

The lifestyle that Widad discovers and embraces among the banat al-ʿishreh is significant for understanding the power and importance of the novel. In *The Silence and the Roar*, Sirees deals with heterosexuality in a way that is honest and simple, without ever resorting to Orientalist stereotypes about Syrian or Arab sexual mores. The same can be said about *Halat shaghaf* in terms of its depiction and description of the banat al-ʿishreh. The personalities of the women Widad comes to live with are vividly fleshed out against the backdrop of their social and professional lives. The ways in which the powerful khojahs wield their influence over younger and more vulnerable women demonstrate the very ordinariness of their relationships but also the capacity for power differentials to influence homosexual and heterosexual situations alike. At the same time, the novel suggests that traditional norms of heterossexual marriage and companionship have not always been the prevailing mode of life in Syria and that there are ways out of and around such arrangements.

There has been a great deal of scholarly debate in Middle East and Islamic studies concerning the history and transformation of homosociality and homosexuality in the Arab world. Following the trend of critical LGBTQ studies, some argue that the invention of homosexual/heterosexual boundaries created new norms, as well as legal restrictions, on behavior and life that were not commonplace prior to the modern period. While this debate is not the focus of the novel, clearly the boundaries of female-female sociality, friendship, and love have not been so obviously delineated over the course of modern Syrian history. Moreover, those norms and boundaries are subject to change, contestation, and subversion. Readers of *Halat shaghaf* will find that Syrian society and culture are diverse and expansive enough to accommodate a wider spectrum of life worlds than is usually recognized.
Given the persistence of titillating Orientalist fascination with the sex lives of Arab and Muslim women, therefore, *Halat shaghaf* serves as a work of cultural excavation and historical reconstruction that sheds important light on modern Syrian history. By dealing with the complexity and variability of friendship and family in Modern Syria, *Halat shaghaf* confounds stereotypical expectations concerning the lives and loves of Syrian women and men.

Harlem Renaissance

CAROLINE RADESKY
PhD candidate
University of Iowa

The queer side of the social and cultural movement centered in the black neighborhood of Harlem in the 1920s and 1930s.

The Harlem of the 1920s and 1930s saw a proliferation of music and writing that was influenced not only by black cultures but also by queer cultures of the period. Part of the larger New Negro movement, the Harlem Renaissance was both an artistic movement and a social and cultural movement primarily led by same-sex–desiring black Americans challenging prevailing notions of race, gender, and sexuality in both white and black communities. Following the Great Migration of African Americans from the South to industrialized cities in the North, queer African Americans joined existing same-sex–desiring communities and created their own sexual subcultures, particularly in Manhattan’s Harlem neighborhood. Though centered in Harlem, the movement spread throughout urban centers in the Northeast and Midwest, eventually traveling across the Atlantic to European cities such as Paris and Berlin. Although historians date the Harlem Renaissance from 1918 to 1935, its origins can be traced back to earlier American slave cultures and its legacy surpassed the 1930s as it continues to influence contemporary queer American artistic and popular cultures today.

The Great Migration and Race Relations in Early Twentieth Century

The hostile racial climate and the migration of black Americans from the South to the North led to the formation of black neighborhoods such as Harlem and the black consciousness that fueled the Harlem Renaissance. By 1900, 90 percent of African Americans lived in the South, the majority in rural areas. The beginning of the twentieth century saw increases in violence against African Americans in the South. With the passage of Jim Crow laws in the region, black Americans lost their civil rights, as segregation became the law of the land. Black Americans were stripped of their rights to vote, hold public office, and occupy certain public space, and they received limited funding for their schools. Jim Crow laws further naturalized the racist ideology rampant throughout the United States. The early twentieth century saw a dramatic rise in violence against African Americans, often in the form of sexual assault and lynchings. In 1915 the American terrorist organization the Ku Klux Klan
experienced a resurgence, as membership and violence grew.

As violence in the South increased, black Americans began migrating to the North for new opportunities and self-determination. The Great Migration saw the movement of over 6 million African Americans from the South to the Northeast, Midwest, and West from 1910 to 1970. There was also a rise in migration from Africa and the Caribbean to the United States, and most of these people settled in the North. Such migrants were often young, unmarried men and women. The migrants in the first wave (during the second decade of the twentieth century) found factory work that could no longer be filled by European immigrants because of World War I (1914–1918) immigration bans. Though no longer living in the Jim Crow South, African Americans in the North continued to experience racism. And racial violence increased further following World War I with the Red Summer of 1919 in which crimes against African Americans skyrocketed throughout the United States, including cities in the Northeast, Midwest, and West.

The greatest of the many black neighborhoods established out of this racial climate and the Great Migration was Harlem, which also became known as the Black Mecca. Once a community of European immigrants, Harlem had become Manhattan’s major black neighborhood during the first two decades of the twentieth century as the city's black community was displaced by the construction of Pennsylvania Station. After a collapse in the real-estate market in 1904, African American churches and businesspeople began buying up property in the area. African Americans and immigrants from Africa and the Caribbean flocked to the northern Manhattan neighborhood, where they could rent and buy housing with less discrimination.

Alain Locke. Howard University professor Alain Locke, the self-proclaimed midwife of the Harlem Renaissance, mentored and financed many queer Harlem Renaissance writers and was himself a same-sex-desiring man.
As the neighborhood grew, rich and diverse black communities took shape with people of various class and ethnic backgrounds, religious practices, and sexual affinities. As the historian George Chauncey wrote, "Harlem became to black America what Greenwich Village became to bohemian white America: the symbolic—and in many respects, practical—center of a vast social experiment" (1994, 245). The Harlem of the 1920s became the home of many ideologies on racial uplift, including Marcus Garvey's back-to-Africa movement and the ideology of the “New Negro,” the foundation of the Harlem Renaissance. The New Negro rejected accommodationist approaches to racial justice and instead advocated racial pride and social disobedience. Howard University professor Alain Locke (1885–1954), the self-proclaimed midwife of the Harlem Renaissance, wrote extensively about the New Negro and extended its political and artistic possibilities. New Negro ideology could explore black experiences, challenge white notions of cultural supremacy, and celebrate black cultures. Locke, a same-sex–desiring man, mentored and financed many queer Harlem Renaissance writers, including Countee Cullen, Langston Hughes, and Zora Neale Hurston.

**Queer Harlem**

Queer Harlem was the backdrop to the work produced by Harlem Renaissance writers, musicians, and artists. Harlem had always been a vice district. The streets of late nineteenth and early twentieth-century Harlem were filled with tenements, bars, clubs, dance halls, and brothels. Black Harlem was much the same. However, as black Americans were perceived as inherently oversexed and sexually degenerate, police and vice squads tended to focus on other parts of Manhattan, leaving Harlem’s black neighborhood alone. This allowed for black queer cultures to thrive in Harlem. It became known as the place to find companionship, dance, and create an intricate black queer culture with its own language, customs, and folklore.

Even at a time when New York City still had laws banning homosexuality and when baths and gay bars were raided frequently by police, being “in the life,” or more openly gay, was possible in early twentieth-century Harlem. Queer African Americans were socializing at cafés, meeting on street corners, gathering at dance halls, and attending cabarets. While many white queer New Yorkers often traveled to gawk and experience Harlem nightlife as sexual tourists, they primarily frequented clubs for white patrons where they could “slum” from a distance. Such institutions included the famous Cotton Club. Queer black Harlemites preferred cellar clubs and rent parties in which people would come together to raise rent for someone in need. Buffet flats—often tenement apartments the renters made available to paying guests—featured parties, speakeasies, and live sex shows. News of these parties was spread by word of mouth, and the parties were frequented by artists of the Harlem Renaissance and even featured in their work, as evidenced in Wallace Thurman's and Countee Cullen's writings.
Drag and drag balls were central to Harlem nightlife in the 1920s. Drag queens appeared regularly in Harlem’s streets and clubs such as the Clam House and Cyril’s Café. But nothing compared to the annual drag ball at Hamilton Lodge. Known as the Faggots’ Ball by Harlemites, the ball was organized by the Grand United Order of Odd Fellows and was advertised as a masquerade and civic ball. It became the largest event for both black and white queer communities in the city. Most of the drag queens were black and would arrive in their gowns, with hopes of being crowned queen of the ball. Queer women would don their suits and strut around with walking sticks and cigars. Not all guests came to dance and dress in drag; a large part of the crowd came to watch the event. African American newspapers in Harlem covered the drag balls extensively, reporting back to an eager and curious audience. Scholars have argued that the presence of drag queens in Harlem, and the coverage of the Hamilton Lodge ball in particular, illustrates a high level of tolerance for drag or performative gender transgression in the neighborhood.

While Harlemites seemingly accepted or tolerated some of the queer community’s activities, the queer community was not without opposition. Members of the black middle class, imbued with notions of respectability, sexual control, and racial uplift, saw the queer community as playing into racist understandings of African Americans as hypersexual, immoral, and sexually degenerate. They worried that the queer community undermined the work they did for racial uplift. Often connected to the black middle class, African American churches condemned same-sex desire. No one was so vocal as the prominent Baptist minister Adam Clayton Powell Sr. (1865–1953), who actively campaigned against homosexuality on the streets of Harlem and worked to end drag balls. Even supporters and patrons of the Harlem Renaissance were weary of its connection to homosexuality. Richard Bruce Nugent (1906–1987), a queer artist and author and a key figure of the Harlem Renaissance, recalled the black activist W. E. B. Du Bois (1868–1963) asking him, “Did you have to write about homosexuality? Couldn’t you write about colored people? Who cares about homosexuality?” (quoted in McBreen 1998, 24). The thriving queer culture, along with the homophobia within the black community, influenced the ways in which queer writers, musicians, and artists approached their work and told their stories.

**Music of the Harlem Renaissance**

Evidence for the pervasiveness of queer culture in the Harlem Renaissance is best illustrated through the emergence of the blues and the same-sex-desiring women at the center of this musical culture. The blues became immensely popular in the 1920s, illustrating the social and sexual attitudes of the Harlem Renaissance. Following the Civil War (1861–1865), the blues developed within black communities in the rural South. It moved north with the Great Migration, as blues clubs emerged in cities such as New York and Chicago, and found its home in Harlem. With the origins of the blues in African American folk music, its lyrics deviated from secular mainstream music, which featured
romantic undertones. Instead, blues lyrics discussed the reality of the challenging world black Americans faced. Such music discussed the realities of life, including heartbreak, struggle, loneliness, poverty, and a longing for home. In particular, black women were able to discuss their particular battles with racism, sexism, and abuse, as well as their sexuality.

The blues became a space to explore sexuality, particularly queer sexualities. It is no coincidence that the musical artists Gertrude “Ma” Rainey, Bessie Smith, and Lucille Bogan, collectively known as the Big Three of the Blues, were same-sex desiring and openly sang about their relationships with women. They could explore both their sexuality and gender expression through their performances, many of which toyed with gender norms, involving the performers taking on masculine personas. The often pejorative term bulldagger emerged in 1920s Harlem to describe primarily black masculine lesbians who dated glamorous women and took on an air of chivalry. Such blatant expressions of sexual deviance furthered many careers, as such bold and brazen expressions were seen as sexy, particularly for bisexual artists. The blues, however, became more than a space to explore sexuality through song; it provided a tangible space where queer women could be with one another and create communities as they performed together, traveled on tour together, and were able to earn a livelihood without a man. The Clam House, a popular queer Harlem nightclub, became the hub of this world.

Ma Rainey (1886–1939), known as the Mother of the Blues, used her music to explore sexuality and life as a black woman. Born in the Deep South to a life of poverty, Rainey entered the stage through minstrel and vaudeville companies. She and her husband, Pa Rainey, traveled throughout the United States with different companies until the second decade of the twentieth century, when they began performing blues in cities throughout the North and South. In 1923 Paramount Records picked her up, and she began recording, becoming one of the first artists to record the blues and eventually recording more than 100 songs. Although married, Rainey pursued relationships with women. In 1925 Rainey was arrested in her home in Harlem where a group of women were having sex. She was bailed out of jail the next morning by fellow blues artist Bessie Smith. This experience led to the release of her most provocative queer song, “Prove It on Me Blues.” The song discusses a night on the town with women because, as Rainey explains, “They must have been women, ’cause I don’t like no men.” She further connects her sexuality and affinity for women with her masculine presentation, wearing a collar and tie, and ability to “talk to the gals just like any old man.” The Paramount poster for the song, which was released in 1928, includes a masculine-looking Rainey flirting with two slim feminine women as a police officer watches from afar. Unlike her other recordings where homoerotic undertones were more covert, “Prove It on Me Blues” is overt in its discussion of lesbianism and illustrates the ways in which Rainey’s sexuality was a selling point for Paramount Records.

A friend and possible lover of Rainey, Bessie Smith (1894–1937) similarly explored her queer sexuality in her music. Born into poverty in Tennessee, and having lost her parents at
a young age, Smith and her siblings looked for work anywhere they could. In 1912 she joined Rainey's traveling troupe and performed as a chorus girl. She was later picked up by Columbia Records while living in Philadelphia with her husband and became the highest-paid female performer of the time. She performed throughout the North and South for predominately black audiences but particularly for working-class Harlemites. She refused to perform at whites-only venues such as the Cotton Club. During her travels, she had relationships with women. Her husband did not approve of her bisexuality and often became violent, leading to their eventual separation. Smith performed songs celebrating same-sex desire such as "It's Dirty but Good" (1930). Unlike other blues songs by women of the era that examine the gender transgression of queer women, "It's Dirty but Good" openly discussed sex between women. The song proved quite popular.

Lucille Bogan (1897–1948), the final artist of the Big Three of the Blues, was considered the most sexually explicit blues singer of the time. Born in Mississippi but raised in Alabama, Bogan married and had her son before she was twenty. She moved to New York City in the early 1920s. Like Rainey and Smith, she too began her career in vaudeville, and she eventually began recording blues music for Paramount Records. Singing “dirty blues,” Bogan wrote songs about her experiences as a sex worker, her alcoholism, her encounters with violent men, and her relationships with women. She performed an anthem celebrating same-sex-desiring women of the Harlem Renaissance titled “B.D. Woman's Blues.” “B.D. Woman’s Blues” examined the “B.D. woman” or “bulldagger” woman. Bogan asserted that “coming’ a time, B.D. women ain't gonna need no men.” In the song, B.D. women can support themselves, drink, dance, and walk “like a natural man.” While Bogan contended that the B.D. women were akin to “natural” men, they still had “a head like a sweet angel” and don't hurt women like “a natural man” does. For Bogan, B.D. women weren't imitating “natural” men; they were superior to them.
Blues Singer Bessie Smith, c. 1920. Smith, who was bisexual, explored her queer sexuality in her music, particularly in the popular song “It’s Dirty but Good,” which openly celebrated sex between women.

Though not part of the Big Three, Gladys Bentley (1907–1960) was a key figure in the Harlem Renaissance. Born in Philadelphia, Bentley moved to New York City at the age of sixteen. She began working in clubs soon after. Her career skyrocketed after she appeared at the Clam House in Harlem. Performing in her signature tuxedo and top hat, Bentley played the piano, sang popular songs with altered sexualized lyrics, flirted with women in the audience, and discussed her relationships with women, including her alleged marriage to a white woman in New Jersey. Although she dressed in male clothing, Bentley never tried to pass as a man. Instead, she blurred the distinction between male and female. Bentley was so popular during the Harlem Renaissance that she appeared as a character in several novels by Harlem Renaissance writers, including the queer masterpiece *Strange Brother* (1931), written by Blair Niles. She continued to perform at gay clubs until the 1950s. During the McCarthy era, however, Bentley claimed to have been cured of her homosexuality. Saying that she had taken female hormones, undergone an operation, and married a man, Bentley began to wear dresses and studied to be a minister.

Authors of the Harlem Renaissance

While many queer writers of the Harlem Renaissance enjoyed sexual freedom within the world of blues halls, buffet flats, rent parties, and clubs, the realities of publishing literature with queer content were much more complicated. Although the Harlem Renaissance was
awash with queer literary production, the authors producing such work had to carefully
navigate the literary world in order to find publishing houses willing to publish their work. The Harlem Renaissance was still in many ways intertwined with earlier twentieth-century racial uplift movements led by such men as W. E. B. Du Bois. Du Bois, and his large following, believed that racial uplift was achievable only through African American communities’ “Talented Tenth.” The Talented Tenth consisted of well-educated, respectable, African Americans who would not only advocate for equality but whose work in and of itself would showcase black genius. Although the foundational ideology of the Harlem Renaissance pushed back against such Victorian understandings of racial uplift, middle-class leaders in the community often sat on the boards of publishing houses. And central to their understandings of racial uplift and black respectability was sexual respectability. Thus, queer authors had to find creative ways to subvert the establishment in order to get their work to the public.

Queer authors of the Harlem Renaissance were not monolithic in their understandings of their sexualities nor in the ways in which their sexuality influenced their work. Many authors were uncomfortable with blatant discussions of same-sex desire and instead used coded language. Some did so to maintain their literary and personal reputations. Others feared the backlash they might experience. Nonetheless, the coded language such authors employed was similar, as they needed it to be understandable to their audiences. One such recurrent theme focuses on the unattainable, often genderless, love. This is best illustrated in the work of Angelina Weld Grimké (1880–1958). The daughter of a prominent Boston family, Grimké was raised by her father and educated in Boston. Because of her father’s position, she was unable to get many of her poems regarding same-sex desire published. However, those she was able to publish used coded language. In particular, she uses flowers to discuss female sexuality. Similarly, she rarely uses pronouns within her writing. Yet the descriptions of the body of her lover were coded female (Honey 2016; Wall 1995).

Similarly to Grimké, Langston Hughes (1902–1967), remembered as one of the most prolific writers of the Harlem Renaissance, used coded language in his work, particularly his poetry. Hughes grew up in small towns throughout the Midwest and lived with his father in Mexico for a brief time. After graduating high school, he attended Columbia University. Experiencing intense racial prejudice, he left Columbia. During his time in New York, he fell in love with Harlem. After working as a crewman on a ship, living abroad for a few years, and attending Lincoln University in Pennsylvania, Hughes returned to Harlem and began writing. Although he pursued relationships with both men and women, he kept his same-sex sexual encounters very quiet. His poetry, however, was full of homoerotic coding. Whitmanesque in style and content, many of Hughes’s homoerotic poems celebrate the masculine body. Others discuss the life of the sailor and the roughness of his masculinity. It was not until 1963 that Hughes published his first openly queer work, “Blessed Assurance.” This short story about homophobia, race, gender transgression, and sexuality used sacred Christian imagery and music to critique homophobia.
Like Hughes, though doing so years earlier, Countee Cullen (1903–1946) used Christian imagery to explore queer subjectivities. Cullen was raised by his grandmother in Harlem and by the Reverend Frederick A. Cullen. He was classically educated at New York and Harvard Universities. After marrying and soon divorcing Du Bois’s only daughter after she became aware of his same-sex desire, he turned to Alain Locke, in whom he confided his same-sex attraction. Locke offered him guidance, reassurance, and countless books to read on homosexuality. It is through such reading that Cullen was introduced to the homoeroticism of Christianity. The use of sacred imagery to explore same-sex desire dated back to the late nineteenth-century, as artists and authors such as F. Holland Day (1864–1933) and Edward Carpenter (1844–1929) used religion and the queer past to think about contemporary same-sex–desiring experiences. For many same-sex–desiring men, religious imagery allowed them to see the naked, often eroticized male body. Cullen used Christianity within his work, particularly in *The Black Christ, and Other Poems* (1929), to explore same-sex desire. In this collection, Christ is a symbol for suffering at the hands of social prejudices.

While some authors had to use coded language to explore queer lives, others were more explicit in their writing and had to find ways to get it to the masses. Wallace Thurman (1902–1934) was one such writer. Born in Salt Lake City, Utah, Thurman moved throughout the West and Midwest before landing in Harlem in 1925. Upon his arrival, he was arrested in a subway washroom for having sex with a man. His wife would later use this against him in their divorce, where she claimed that he was a homosexual. For the next decade, Wallace worked as an author of novels and plays, ghost writer, editor, and publisher. In 1932 he wrote *Infants of the Spring*, a satire of the Harlem Renaissance that dealt with openly gay characters.

With his socialist leanings and contempt for the black elite and their Talented Tenth, Wallace challenged such authority. He was not alone in doing so. A group of young radical writers in the Harlem Renaissance, whom Thurman ironically named the Niggeratti, had similar objections to the old guard. The group included Zora Neale Hurston, Langston Hughes, Richard Bruce Nugent, John P. Davis, Aaron Douglas, and Gwendolyn Bennett. They met at Thurman's rooming house in Harlem, which Thurman and Hurston jokingly called “Niggeratti Manor.” The walls were painted by the author and artist Richard Bruce Nugent with homoerotic subject matter in black and red. The group discussed their frustration with the black elite and their methods of racial uplift. They believed the New Negro movement spent too much time trying to show white Americans that they were respectable and equal according to middle-class white values. This group, along with Cullen and Lewis Grandison Alexander, thus set out to publish *Fire!! A Quarterly Devoted to the Younger Negro Artists*. The journal was intended to portray black lives as they were, not as the elites wanted them to be perceived. Sexuality was at the core of *Fire!!* As African Americans were portrayed as hypersexual in the minds of white Americans, heterosexual sexual
respectability became central to racial uplift. The authors in *Fire!!* wanted to show how actual black Americans lived, not as the elites wanted them to be perceived. Hurston wrote on colorism in the black community, Bennett wrote on interracial relationships, and Thurman wrote on sex work and the corruption of black women by men of the Talented Tenth. But it was Nugent’s “Smoke, Lilies, and Jade” (1926) that upset black elites, who called for the destruction of the self-published journal.

Scholars remember Nugent as the only completely “out” writer and artist of the Harlem Renaissance. Nugent was the first black author of the Harlem Renaissance to have written and published a story with candid homosexual content. Moreover, he wrote about the intersectionality between being black and gay decades before James Baldwin (1924–1987) published *Giovanni’s Room* (1956). Punctuated with ellipses, “Smoke, Lilies, and Jade” is a Joycean stream-of-consciousness story of an interracial queer couple. Semiautobiographical, the story dealt openly with gay sex and the desire between these two men. It also dealt with the struggles of coming to terms with one’s queer sexuality, the shame experienced, and the politics of the family. Nugent’s writing career focused on homosexual characters throughout the twentieth century. At times, however, his work had to become more coded, and he often relied on biblical imagery to do so.

**Legacy**

Following the crash of the stock market in 1929, and the impending Great Depression of the 1930s, the Harlem Renaissance was in decline. The queer Harlem Renaissance, however, has had a long legacy. It not only began the rich queer black literary tradition of the twentieth and twenty-first centuries, it made room for the exploration of such identities within both black and white communities. Such work was resurrected during the gay liberation movements of the 1970s, as queer men and women looked for images of themselves in the past. From voguing to *RuPaul’s Drag Race*, the Harlem Renaissance forever changed popular culture, influencing queer music and television in the twenty-first century.

**BIBLIOGRAPHY**

The development of US laws against crimes that target persons because of their particular status group, with a focus on legislation protecting LGBTQ persons.

Violence motivated by animus toward persons or groups, based on social statuses such as race, gender, age, (dis)ability, or sexual orientation has long been an identifiable feature of human social interaction, historically and around the globe (Boswell 1980; Comstock 1991; Jenness and Grattet 2001; Smyth and Jenness 2014). Indeed, physical and symbolic violence aimed at individuals who identify as LGBTQ (lesbian, gay, bisexual, transgender, queer) or otherwise gender variant has been accepted as part of the social fabric in most societies throughout the Common Era (Boswell 1980; Smyth and Jenness 2014). In Gay American History (1976), Jonathan Katz traces a 400-year history of violence perpetrated against sexual and gender minorities that includes castrations, beatings, imprisonments, chokings, electrical shocks, forced medical procedures, drownings, hangings, and burnings. Documented cases of such atrocities throughout history and across cultures and societies underscore the claim by LGBTQ activist and former director of the National Gay and Lesbian Task Force (NGLTF) Virginia Apuzzo that “to be gay or lesbian is to live in the shadow of violence” (quoted in Comstock 1991, 54). Data representing the violent victimization of thousands of gay men and lesbians in the United States led the Department of Justice (DOJ) to issue a report concluding that “the most frequent victims of hate violence today are blacks, Hispanics, Southeast Asians, Jews, and gays and lesbians. Homosexuals are probably the most frequent victims” (NGLTF 1987, 10).

Emergence of an Anti–Hate Crime Movement in the United States

Although bias-motivated violence is clearly an age-old problem, it was not until the latter decades of the twentieth century that hate crime as we understand it today emerged as a subject of public discourse and criminal justice policy making. The term hate crime (used interchangeably in this entry with bias crime and bias-motivated violence) entered public
discourse in the late 1970s and was politicized and constructed in particular ways in the 1980s and 1990s through the efforts of an anti–hate crime movement in the United States (Jenness 2009).

Terry Maroney (1998) has detailed the emergence of an anti–hate crime movement in the United States "on the coattails of previously institutionalized social movements; specifically, modern understandings of 'hate crime' in the United States are a product of a confluence of several social movement discourses, most notably the black civil rights movement, the modern women's movement, the gay and lesbian movement, the disabilities rights movement, and the crime victims' movement" (579; see also Jenness and Broad 1997; Jenness and Grattet 2001). These rights-based movements, which emerged in the 1960s and 1970s, were fundamentally committed to documenting and combating bias-motivated violence targeting particular status groups. Together, they "provided the structural basis and discursive themes necessary to set the stage for a reconceptualization of [all bias-motivated] violent conduct ... toward minorities as hate crime" (Jenness and Grattet 2001, 20; see also Jacobs and Potter 1998; Maroney 1998; Jenness and Broad 1997; Levin and McDevitt 1993). Composed of a variety of diverse organizations including the Anti-Defamation League of B'nai B'rith (ADL), the NGLTF, the National Institute Against Prejudice and Violence, the Center for Democratic Renewal, the Southern Poverty Law Center (SPLC), the National Victim Center, and multiple others, the US anti–hate crime movement effectively "discovered" hate crime as a social problem, rendered the problem empirically credible by documenting an alleged “epidemic” of bias-motivated violence, and called for measures to be put in place to address the problem (Jenness and Broad 1997; Maroney 1998; Jenness 2009; Smyth and Jenness 2014). The now commonplace usage and largely taken-for-granted meaning of the term hate crime in multiple, diverse settings across the social landscape is testament to the success of the anti–hate crime movement in the United States, whose work created a social perception that escalating levels of hate crime in the modern era constitute a social problem demanding a specific governmental response—in particular, the enactment of federal- and state-level legislation and the implementation of attendant policies aimed at mitigating the harm of violence motivated by bigotry (Jenness and Grattet 2001).

**Essential Elements of Hate Crime Law**

Legislative measures at both the state and federal levels rely on three essential elements to define what constitutes a hate crime. First, statutes list a range of predicate crimes that may potentially be regarded as hate crimes, given the second criterion. Second, they require some provision—whether stated or implied—of motivation driven by prejudice or extreme bias. Finally, they describe the range of protected groups, or status provisions.
Hate crime statutes all share the necessary condition of stating or implying that some form of hate or bias motivates offenses, although there are many ways that this is communicated in the statutes. There is wider variation among statutes in the degree of specification of predicate crimes and, when specified, the range of offenses listed. There are also significant differences across statutes in the level of specification and number of protected groups listed.

(SHIVELY 2005, 13)

Key Federal Hate Crime Laws

There is no definitive federal statute that addresses bias-motivated criminal activity. Like other criminal actions, a vast majority of hate crime prosecutions are handled at the state level. Nevertheless, federal officials do investigate and prosecute bias-motivated crimes as criminal civil rights violations. This jurisdiction is necessary not only to authorize federal prosecution in those cases in which state and local officials are either unable or unwilling to act, but also to permit joint state and federal-level prosecutions of certain crimes.

A number of factors make the date of the first federal hate crime law debatable. As early as 1968, federal legislation to criminalize certain bias-motivated behaviors was enacted when President Lyndon B. Johnson (1908–1973) signed the Civil Rights Act of 1968 after it was easily passed by the US House of Representatives and Senate by votes of 326 to 93 (GovTrack 2018a) and 71 to 20 (GovTrack 2018b), respectively. The provisions of the act made it “a crime to use, or threaten to use, force to willfully interfere with any person because of race, color, religion, or national origin, and because the person is participating in a federally protected activity, such as public education, employment, jury service, travel, or the enjoyment of public accommodations, or helping another person do so” (US DOJ 2018). Importantly, the Civil Rights Act of 1968 was the first federal law to draw a distinction between conventional crimes and those motivated by bigotry. However, while the act directly addressed the concerns of the civil rights era, its scope was limited vis-à-vis the concerns of the anti-hate crime movement, both in terms of the types of behaviors it proscribed and the protected statuses it included. Note in particular that the status provisions included in the act—race, color, religion, and national origin—are the core statuses that focused the work of the civil rights movement; sexual orientation, gender, and (dis)ability are not among the statuses the act is intended to acknowledge. Accordingly, while some point to the Civil Rights Act of 1968 as the first piece of federal hate-crimes legislation, it might be better understood as belonging to the body of legislative actions associated with the civil rights era rather than as the first federal hate crimes law.

Hate Crime Statistics Act (HCSA) of 1990 A majority of scholars today point to the Hate
Crime Statistics Act (HCSA) of 1990 (Pub. L. 101-275) as the first federal-level hate crimes law in the United States. President George H. W. Bush (1924–) signed the bill into law on 23 April 1990 (Herek 2017). Much of what we know today about hate crimes at the national level is attributable to the provisions included in the HCSA. Although it was the first federal law to include the term hate crime, the HCSA did not establish a new category of crime, nor did it stipulate new penalties for bias-motivated violence or provide new avenues of recourse for victims (Jenness and Grattet 2001). Instead, the act simply mandated the US DOJ, under the direction of the attorney general, to establish standards and begin collecting statistical data for each calendar year on “crimes that manifest evidence of prejudice based on race, religion, sexual orientation, or ethnicity, including where appropriate the crimes of murder; non-negligent manslaughter; forcible rape; aggravated assault, simple assault, intimidation; arson; and destruction, damage or vandalism of property” (Pub. L. No. 101–275). Moreover, the act requires the publication of an annual report of descriptive statistics based on the collected data.

Not only is the HCSA typically regarded as the first federal hate crime law, it was also the first federal law to acknowledge sexual orientation as a protected status. Introduced in 1985, the act, and the federal hearings it engendered, brought increased national attention to the problem of hate-motivated violence. However, the version of the HCSA that initially debuted on the national stage contained a somewhat narrower understanding of “hate crime” than did the final version of the bill that President Bush signed in 1990. Recalling that the problem of bias-motivated violence was originally brought to national attention through the efforts of watchdog agencies such as the ADL, the SPLC, and the NAACP—organizations primarily focused on racial and religious discrimination—it is not surprising that early efforts to develop hate crime legislation tended to reflect the dominant constructions of hate crime advanced by those social movement actors (Jenness and Grattet 2001). Thus, while race, religion, and ethnic origin were included, sexual orientation was not among the status provisions identified in early drafts of the HCSA. Sometime between 1985 and signing of the bill in 1990, a clause adding sexual orientation to the list of protected statuses was inserted into the bill, thus expanding the federal definition of hate crime. “Similar to the role played by the ADL in the initial hearings on hate crime, the voice of the National Gay and Lesbian Task Force (NGLTF) and other gay and lesbian civil rights organizations primarily focused on racial and religious discrimination—it is not surprising that early efforts to develop hate crime legislation tended to reflect the dominant constructions of hate crime advanced by those social movement actors (Jenness and Grattet 2001). Thus, while race, religion, and ethnic origin were included, sexual orientation was not among the status provisions identified in early drafts of the HCSA. Sometime between 1985 and signing of the bill in 1990, a clause adding sexual orientation to the list of protected statuses was inserted into the bill, thus expanding the federal definition of hate crime. “Similar to the role played by the ADL in the initial hearings on hate crime, the voice of the National Gay and Lesbian Task Force (NGLTF) and other gay and lesbian civil rights groups proved crucial in evoking and sustaining the expansion of the law” (Jenness and Grattet 2001, 56). An NGLTF report recorded in official congressional testimony in 1986 articulated the gay and lesbian position with regard to hate crime law:

We urge Congress to pass legislation that would clarify the scope of federal statutes 18 U.S.C. 241 and 42 U.S.C., so that they clearly protect the full range of groups in this country that are subjected to acts of violence because of their status or identity. [By] failing to include provisions for gay and lesbian people in
The inclusion of sexual orientation as a protected status in the HCSA did not go uncontested. In fact, as Valerie Jenness and Ryken Grattet (2001) note, it prompted an all-out assault by conservatives in both houses of Congress (see also Fernandez 1991). While some objected to the inclusion of sexual orientation on the grounds that the addition of an additional status provision alongside race, religion, and ethnic origin would render data collection too broad and too expensive, the primary objection was grounded in the notion that the federal government should not provide gays and lesbians with “special” rights, and that to do so would render violence against gays and lesbians equivalent to violence against racial, ethnic, and religious minorities. “It is a federal responsibility to ensure the equal protection of all citizens regardless of their race, religion, or ethnic origin. It is not a federal obligation to protect citizens in their sexual orientation,” conservatives in Congress argued in 1988 (quoted in Jenness and Grattet 2001, 59). Representative William Dannemeyer (1929–; R-CA) and Senator Jesse Helms (1921–2008; R-NC) were especially vehement in their protests against inclusion, right up until the bill was signed. Congress is being “hoodwinked,” Helms argued, into passing the “flagship of the homosexual … legislative agenda” (quoted in Jenness and Grattet 2001, 59). Such conservative objections notwithstanding, the status of gay and lesbian people as victims of hate-motivated violence was ultimately recognized in the language of the HCSA and, over time, institutionalized as a key element of the character of hate crime law.

Violent Crime Control and Law Enforcement Act of 1994 Four years after the HCSA became law, President Bill Clinton (1946–) signed the Violent Crime Control and Law Enforcement Act into law on 13 September 1994. The new law identified eight predicate crimes—murder, nonnegligent manslaughter, forcible rape, aggravated assault, simple assault, intimidation, arson, and destruction, damage, or vandalism of property—for which judges would enhance penalties of “not less than three offense levels for offenses that finder of fact at trial determines beyond a reasonable doubt are hate crimes” (Pub. L. No. 103-322). For the purposes of this law, hate crime is defined as criminal conduct in which “the defendant intentionally selected any victim or property as the object of the offense because of the actual or perceived race, color, religion, national origin, ethnicity, gender, disability, or sexual orientation of any person” (Pub. L. No. 103-322). The new guidelines took effect on 1 November 1995. Although broad in form, the law is of limited utility because it applies only to federal crimes, such as those that fall under federal criminal civil rights statutes and other federal crimes such as attacks and vandalism that occur in
national parks and on other federal properties (Smyth and Jenness 2014).

**Violence Against Women Act (VAWA) of 1994** Shortly after sexual orientation had joined race, religion, and ethnic origin as a status provision in hate crime laws, Congress began to take seriously a growing demand to include gender as a protected status as well (Jenness and Grattet 2001). It was not until 1994, however, when the US Congress passed the Violence Against Women Act (VAWA), that gender was finally recognized as a protected status. Enactment of VAWA marked the end point for an effort initiated by Joseph Biden (1942–), then senator from Delaware, when he submitted to Congress a preliminary proposal to address the issue of violence against women. Working closely with Biden and the staff of the Senate Judiciary Committee, the NOW Legal Defense and Education Fund brought experts and organizations together in the Task Force on the Violence Against Women Act to help draft and pass the legislation recognizing the severity of the crimes associated with domestic violence, sexual assault, and stalking. Task force efforts met with strenuous opposition, especially in regard to a proposed civil rights remedy that would allow victims of gender-based violence to sue their attackers. Opponents of the act argued that such a provision would bring large numbers of family disputes into the federal courts and overwhelm the system with domestic matters that did not belong there (Legal Momentum 2018).

Ultimately, the VAWA was enacted with its civil rights provisions largely intact. Title III of the act positioned select crimes against women as equivalent to acts of violence based on race, ethnicity, national origin, religion, and sexual orientation. In the end, this argument met with little resistance, which “suggests that its logic had already achieved legitimacy. In other words, violence committed against an individual in order to send a message of animus to a larger community was increasingly taken for granted as a core component of hate crime law” (Jenness and Grattet 2001, 65). The VAWA survived a number of constitutional challenges in the courts. However, when a case challenging its underpinning civil rights remedy reached the US Supreme Court in 2000, the remedy was struck down as unconstitutional in a 5 to 4 decision penned by Chief Justice William Rehnquist (1924–2005) in *United States v. Morrison* (529 U.S. 598).

**Matthew Shepard and James Byrd Jr. Hate Crimes Prevention Act (Shepard/Byrd Act) of 2009** The brutal and tragic hate-motivated killings of Matthew Shepard (1976–1998) and James Byrd Jr. (1949–1998) in 1998 became a touchstone for a subsequent surge of activism calling for expanded federal legislation to protect victims of bias-motivated violence. Byrd, a forty-nine-year-old black man living in Jasper, Texas, accepted a ride from three white men, hoping that they would take him home. “Instead … the three men beat Byrd … strip[ped] him naked, chain[ed] him by the ankles to their pickup truck and dragged him for three miles over rural roads” (Human Rights Campaign 2018). Byrd was alive during much of the dragging, which abraded away most of his skin, severed his right arm, and ended in his decapitation when his body caught a sewage drain. The three
assailants, identified as members of various white supremacist organizations, expressed no regret for the killing.

Only a few months after Byrd was killed in Texas, twenty-one-year-old gay University of Wyoming student Matthew Shepard met Russell Henderson and Aaron McKinney at a bar in Cheyenne. Subsequently, the two men lured Shepard to their vehicle and drove him to a remote area where they tied him to a split-rail fence, beat him severely, and left him to die in the freezing night. Shepard was found unconscious eighteen hours later by a passing cyclist, and he died six days later at a hospital in Fort Collins, Colorado. Shepard’s murder was one of 1,269 hate crimes in 1998 alone that police identified as motivated by sexual orientation bias.

The history of hate crimes committed against LGBTQ people in the United States is replete with stories such as Shepard’s. The FBI’s 2016 analysis of hate crime data indicates that the number of violent crimes targeting the LGBTQ community is second only to the number of violent incidents based on racial animus. Gay men have an especially high rate of victimization. Indeed, while race-based hate crimes are numerically the most frequent incidents, gay men are by far the most frequently victimized population per capita (Rubenstein 2004). Although it was not approved by both houses of Congress until eleven years after Shepard’s murder, the Shepard/Byrd Act (2009) was, in some ways, an attempt to acknowledge this.

President Barack Obama (1961–) signed the Matthew Shepard and James Byrd Jr. Hate Crimes Prevention Act on 28 October 2009. The measure was a priority of Senator Edward M. Kennedy (1932–2009; D-MA) that had been on the congressional agenda for a decade. To ensure its passage after years of frustrated efforts, Democratic supporters attached the measure to the must-pass defense policy bill, over the steep objections of many Republicans (Weiner 2017). The Shepard/Byrd Act expanded federal hate crimes protections contained in the Civil Rights Act of 1968 to include crimes motivated by the victim’s actual or perceived gender, sexual orientation, gender identity, or disability. In addition to expanding the umbrella of protected characteristics, the act also removed the requirement that the victim be engaged in a federally protected activity (such as attending school or voting). This law, in conjunction with those that preceded it, demonstrates a relatively strong, shared commitment on the part of many advocates in the United States to using federal power to enhance the status and welfare of sexual and gender minorities as differentially vulnerable to violence motivated by bigotry (Smyth and Jenness 2014).
President Barack Obama Speaks at the Enactment of the Matthew Shepard and James Byrd Jr. Hate Crimes Prevention Act on 28 October 2009. Known informally as the Shepard/Byrd Act, this legislation expanded federal hate crimes protections to include crimes motivated by the victim's actual or perceived gender, sexual orientation, gender identity, or disability, prompted in part by the hate-motivated killing of Matthew Shepard, a gay University of Wyoming student. Shepard’s parents look on as Obama speaks.

State-Level Hate Crime Laws

Although federal-level hate crime laws generally garner more public attention, in the United States, criminal law is principally a state-level function. Accordingly, the vast majority of hate crime statutes are state-level laws, and the vast majority of hate crimes are prosecuted by state and local law enforcement officials. Hate crimes are generally not separate and distinct criminal offenses. Each state defines differently the criminal activity that constitutes a hate crime, and the breadth of coverage of these laws varies from state to state as well (ADL 2012). State hate crime laws typically contain provisions regarding some state policy action, an intent standard, and a specified list of protected statuses. “To qualify as a hate crime law, a state statute must criminalize, enhance penalties for, or amend existing statutes regarding crimes motivated by bias toward individuals or groups based on particular status characteristics” (Jenness and Grattet 2001, 77).

Although the first state-level hate crime laws emerged in Washington and Oregon in 1981, the first state to include provisions to protect the entire LGBTQ community was Minnesota, which listed both sexual orientation and gender identity among the status provisions named in its 1993 law. Washington joined Minnesota in acknowledging sexual orientation
as a protected status in 1993 (Human Rights Campaign 2017). However, it was not until 2009—after ten other states and the District of Columbia had already done so—that the state of Washington recognized gender identity as a status provision in its hate crime laws. Like the federal government, states were slow to extend legal protection to the LGBTQ community. In 1999, when forty-one states had adopted some form of hate crime statute (Jenness and Grattet 2001), only California had joined Minnesota and Washington in extending protections to include sexual orientation or gender identity. The decade leading up to passage of the Shepard/Byrd Act, however, saw significant change in this regard. Between 1999 and 2009 twenty-nine US states enacted legislation extending their status provisions to include sexual orientation, gender identity, or both (Jenness and Grattet 2001).

As of May 2018, eighteen US states and Washington, DC, had laws that address hate or bias-motivated crimes based on gender identity or sexual orientation. An additional twelve states address hate or bias-motivated crimes based only on sexual orientation. Of the remaining states, fifteen have hate crime statutes that do not include sexual orientation or gender identity as protected classes: Alabama, Alaska, Idaho, Michigan, Mississippi, Montana, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, South Dakota, Utah (no categories listed), Virginia, and West Virginia. Five states—Arkansas, Georgia, Indiana, South Carolina, and Wyoming—have no statutes that address hate crime (Human Rights Campaign 2017).

Trends in Hate Crime Law and Policy

Among the trends in state-level hate crime legislation are moves toward (1) expanding the number of protected status groups, recognizing, in particular, that groups defined by sexual orientation and disability are frequent targets of bias-motivated violence; (2) providing penalty enhancement for hate and bias motivated crime; and (3) requiring data collection and statistical reporting (Shively 2005). Several interest groups maintain up-to-date maps and other interactive online materials that allow users to investigate the history, current status, and content of state-level hate crime laws in the United States. The ADL, the Human Rights Campaign, the NGLTF, and the SPLC, among others, offer especially effective digital materials of this type.

Over the nearly forty-year history of hate crime legislation in the United States, the diffusion of hate crime laws across jurisdictions is clear. In 1981 only two US states had passed legislation responding to the problem of bias-motivated violence. Between 1981 and 1984 an additional ten states passed hate crime statutes into law. In the ensuing five years another fourteen states passed similar laws, and between 2000 and 2004 Hawaii, Indiana, Georgia, New Mexico, and South Carolina passed hate crime statutes. As of 2018, only five US states did not have any hate crime laws in effect, including Georgia, where legislators had passed a hate crime statute that was later declared unconstitutional. The
proliferation of hate crime laws across the nation is testament to the successful, sustained effort of a US anti–hate crime movement to generate public discourse about violence born of bigotry and to effectively demand legal change to remedy the problem (Grattet and Jenness 2001).

In addition to the proliferation of hate crime laws across jurisdictions, Grattet and Jenness (2001) note a trend toward convergence—that is, regardless of jurisdiction, over time, state statutes designed to address bias-motivated crime have become increasingly similar in their conceptualization of hate crime. This trend is especially discernable in the language these laws have employed with regard to motivation or intent. For example, hate crime laws have employed four different ways of characterizing the motivational requirement for conviction under the statute (Grattet and Jenness 2001). Some have used language requiring prosecutors to show that an act was precipitated by “animus, hostility, maliciousness, or hatred” while others require that perpetrators be shown to have had an intent to “maliciously and with specific intent to harass” the victim. Similarly, a third type requires an intent to “harass and intimidate” the victim. Each of these requires a particular subjective state on the part of the perpetrator. A fourth motivational requirement requires prosecutors to show that the offense was committed simply “because of” race, religion, and so on—a far easier standard to prove. Prior to 1987 there was little consensus among states on motivational language. By 1990, however, the latter two examples had emerged as the dominant forms, and finally, after 1993, about half of state laws had adopted the “because of” phrasing (Grattet and Jenness 2001). This convergence around motivational language over time suggests that, following a period of experimentation when legislatures had no clear models to guide them, policy making is increasingly informed by mimicry of early innovators and their experience of what works (Grattet and Jenness 2001). The result has been a reconceptualization, or narrowing, of the concept of hate crime as the “because of” motivation is institutionalized.

**Concept Expansion** As bias-motivated violence has become a legal and policy issue, the term *hate crime* has been refocused and specified in the legislative arena, resulting in changes to its fundamental nature (Grattet and Jenness 2001). Jenness notes a trend among legislators toward extending the legal protections of hate crime law beyond the taken-for-granted core status groups defined by race, religion, and ethnic origin to recognize the lived reality of women, gays and lesbians, and people with disabilities as potential victims of bias-motivated violence (Jenness 1999). In addition, as hate crime law has increasingly become a fact of legal life in the United States, the experiences of prosecutors and judges have led to further concept expansion as their understanding of hate crime extends beyond stereotypical hate-based incidents such as gay bashings and modern-day lynchings to include more subtle and complex forms of violence.

**Meaning Making and Settling**
At any given moment in time, legal rules and categories exist on a continuum from controversial to settled (Friedman 1967). Although lawmakers are responsible for writing legislation that articulates broad legal concepts, rules, and guidelines, laws are not really meaningful as they exist in statute books. Instead, they take on meaning as they are applied in practice. The making of legal meaning occurs in multiple sites inside and outside of the formal legal system (Mertz 1994); courts are correctly understood to play a central role in determining the meaning of new laws. When hate crime entered the US appellate courtroom, it did so as an ambiguous legal category accompanied by a set of attendant, equally ambiguous legal rules. Scott Phillips and Grattet (2000) have documented the process through which hate crime has been transformed in judicial opinions into a relatively settled legal construct that is generally accepted as legitimate. Tracking judicial rhetoric across thirty-eight appellate opinions considering the constitutionality of hate crime laws between 1984 and 1999, these researchers found that hate crime emerged from these challenges a far richer, more nuanced, and more settled concept than the collection of words contained in legislation would suggest, and that it had undergone construct expansion to include a broadened range of behaviors and mental precursors. Moreover, in the process, judges developed a specific rhetoric for responding to constitutional challenges to hate crime statutes and had begun to converge around formulaic sets of arguments to negotiate future constitutional challenges.

Helem

TAREK ZEIDAN
Helem activist
MPA candidate, Harvard University

The first official LGBTQ+ rights organization in the Middle East.

Helem, which in Arabic is an acronym for “Lebanese Protection for LGBTs,” was founded in Beirut, Lebanon, on 4 September 2004 as a nonprofit organization committed to improving the legal and social status of LGBTQ individuals. Helem is also the Arabic word for “dream,” symbolizing the organization’s vision and commitment to engage in the peaceful struggle to end all forms of discrimination based on sexual orientation and gender identity in Lebanon and the Middle East.

Helem was conceived as the institutional evolution of the underground association known as “Club Free,” a collective of young queer activists united by the internet and their desire for equality with the aim of protecting and improving the lives of at-risk LGBTQ+ individuals. Helem focuses its advocacy on providing legal and social services, building community, delivering health services including HIV awareness and prevention, and engaging in grassroots activism. One of Helem’s principal goals is to abolish Article 534 of the Lebanese penal code, which criminalizes “sexual acts against the order of nature,” with penalties of up to one year in prison, and is frequently used to arrest, detain, abuse, and incarcerate vulnerable LGBTQ+ individuals, especially refugees, migrant workers, and sex workers. Helem devotes most of its resources toward securing the release of these individuals, providing them with legal advice and representation, documenting abuses against their human rights, and providing them with a safe space.

Helem also created and still maintains the first LGBTQ community center in the region of the Middle East and North Africa, which over the years has evolved into a major hub for grassroots initiatives and community-led activism. The center works on engaging the Lebanese public through highly visible campaigning, including holding the first LGBTQ rights protest in the region in February 2009 and promoting queer causes in the media. It has published numerous pioneering reports and research on issues related to sexual orientation and gender identity in Lebanon, including the first book on homophobia, Rihab al-mithliya (2006; Homophobia). Helem has also successfully lobbied to end rectal examinations as a method for determining sexual orientation by the Beirut police and to remove homosexuality from the list of disorders recognized by the Lebanese Psychological Association and Lebanese Psychiatric Society (which occurred in 2013). Helem’s legal team
has been involved in some of the most important cases involving queer individuals, including a landmark case in 2017 where a Lebanese court, for the first time, ruled against Article 534 by affirming homosexuality as a natural right. Helem’s services also focus heavily on supporting the transgender community in Lebanon, with special emphasis on providing protection against police harassment and arbitrary detention through sensitization and awareness programming.

Activists from Helem have gone on to found organizations of their own, including Meem, the first community organization for lesbian, bisexual, and queer women in the region; al-Mou’assasa al-Arabiya li al-Hurriyat wa al-Musawat (Arab Foundation for Freedom and Equality), a regional organization dedicated to capacity building and activist empowerment; Helem Montreal and Helem Paris, sister organizations dedicated to serving the Lebanese and Arab queer diaspora; and Marsa, an award-winning Lebanese sexual health center that evolved to focus on sexual and reproductive services independently. Since 2012, Helem has reoriented its advocacy to include legal and policy reform, engaging directly with the Lebanese government, judiciary, and security institutions to end state-sponsored discrimination. Helem seeks to expand its fight for equality by building coalitions and engaging with networks in the Global South to learn from and benefit other LGBTQ+ movements in postcolonial and postconflict societies.

BIBLIOGRAPHY

In 1998 Professors Diana Taylor (New York University), Zeca Ligiéro (Universidade Federal do Estado do Rio de Janeiro, Brazil), and Javier Serna (Universidad Autonóma de Nuevo León, Mexico) founded the Hemispheric Institute of Performance and Politics, seeking to expand and to share approaches for analyzing embodied practices. Housed within the Department of Performance Studies at New York University’s Tisch School of the Arts, the Hemispheric Institute generated a network of institutions, scholars, art practitioners, and activists that work at the intersection of performance and politics throughout the Americas. Since its inception, the Hemispheric Institute has been instrumental in the archiving of LGBTQ performances, given that its philosophical structure and methodologies place the body at the center of theoretical, artistic, and activist interventions. This theoretical and practical vision is in tune with the work of a community disenfranchised because of normative constrictions on the body; at the same time, the LGBTQ artistic and activist response to these challenges transforms the marginalized body into a site of political self-affirmation. In this way, the Hemispheric Institute has enabled a collaborative and inclusive environment while developing expertise in information technologies. Currently, its website hosts e-misférica, an online trilingual scholarly journal; an archive of team-taught courses that promote transnational collaborations; and HemiPress, an innovative digital press, among other initiatives. These digital platforms have enormously increased the network’s scope and ability to make its resources accessible worldwide.

Following its commitment to inclusivity and to theoretical/practical artivism, in 2005 the Hemispheric Institute, in collaboration with New York University Libraries, received funding from the Andrew W. Mellon Foundation to create a publicly accessible online collection of digital video. Both institutions devoted themselves to developing the production and institutional repository systems needed to support such an archive. This initiative launched the Hemispheric Institute Digital Video Library (HIDVL, which can be viewed at hidvl.nyu.edu) with the objective of rescuing and preserving hundreds of hours of video documenting the artistic expression of social and political life in the Americas. Understanding “performance” in a multilayered way, this archive includes theatrical
performances, body art, multimedia art installations, lectures, dance pieces, street art, and activist interventions, among an expanding range of cultural expressions.

A pioneering web platform, HIDVL guarantees that these digital video materials will be made available and preserved for at least 500 years—a timeline envisioned taking into consideration the dynamics of current technological developments. At the same time, continuing management of the video collections foresees potential migrations to new digital and web formats in the future. This enduring commitment is made possible through both the technological support of New York University Libraries and the networked practices of the Hemispheric Institute. The fragility of certain video formats led librarians like Jerome McDonough, New York University’s Digital Library Development team leader at the beginning of this project, to incorporate technologies that capture data in the highest-quality possible in order to preserve tapes that were in danger of disintegration. New York University and the Hemispheric Institute worked closely with artists throughout the Americas to collect these tapes, digitize their content, render both preservation-quality and streaming-quality video files, and make them available around the world for present and future generations.

As of 2018, HIDVL offered more than 900 hours of video documentation accompanied by a trilingual artist profile (in English, Spanish, and Portuguese) that provides context, including production information, photo galleries, interviews, and a comprehensive bibliography. The web platform is available to a growing number of scholars, educators, artists, and activists whose work depends on video documentation. Continuing with its founders’ vision, HIDVL seeks to promote dialogue and a deeper understanding of performance and politics in the Americas, featuring artistic works that discuss topics such as state-sponsored violence, social movements, feminism, race relations, and migration, among others. Gender and sexuality, and the response from LGBTQ communities to the policing of the body, continue to be key topics for this digital archive. The works of the various artists and activists preserved in HIDVL offer insights to understanding queer studies as theory, methodology, and practice.

**Archiving the Repertoire**

HIDVL collections are curated and showcased following the understanding of “performance” in a broad sense as a repertoire of embodied practices. Diana Taylor (2003) studies how these bodily behaviors function as “acts of transfer” that transmit knowledge, memory, and a sense of identity. The repertoire challenges and expands the limits of the written archive, offering alternative ways of thinking and doing. The contribution of HIDVL lies in its focus on video documentation of “live” embodied practices; in this sense, it is a new form of archiving that dwells in-between the archive and the repertoire’s dynamic interaction. By broadening the archive beyond the realm of the textual, HIDVL expands the corpus available for research and teaching, and promotes and enables critical reflection.
about the sources upon which scholarship in the humanities is based.

The scope of HIDVL encompasses the work of artists that might seem disparate at first glance. For example, one of the first HIDVL collections corresponds to the Colectivo de Acciones de Arte (CADA; Collective for Art Actions), an activist group of artists in Chile who used performance between 1979 and 1985 to challenge the dictatorship of Augusto Pinochet (1915–2006). CADA incorporated strategies of theatricality and performance in all of its “art actions,” conceiving art as a necessary social practice that blurred the traditional distance between the artist and the spectator. Their “interventions in everyday life” intended to disrupt the normalized routines of daily urban life in a context where civil and human rights were under open attack by the state. CADA’s members were the avant-garde of political performance art in the Americas, and they remain respected voices on social resistance.

Moving forward, in 2016 HIDVL featured the work of Alina Troyano, also known as Carmelita Tropicana, a Cuban-born performance artist, playwright, and actor who has presented her work internationally. In Tropicana’s work, humor, irony, and playful eroticism become subversive tools to question issues of gender, sexuality, and national identity. One of the best examples of her work is her Pingalito Betancourt persona, portrayed as the stereotypical Latin macho who at the same time longs for lost affective ties. Carmelita Tropicana brings together migration, bilingualism, and transculturation in her cabaret-style performances, generating a space of intimacy with her audiences.

Initially, these two collections might not seem mutually coherent. Whereas CADA’s strategies of resistance operate in a larger social context of authoritarianism, Carmelita Tropicana reveals the intimate struggles of subjects that inhabit in-between worlds and gender identities. However, reading these artists’ work together, it is possible to see their convergences as spaces that are open to imagining utopian possibilities for survival, which starts with creatively opening spaces from and for diverse identities (Muñoz 1999). The details of their performances could have faded into oblivion given that the occurrence of embodied practices happens in an unrepeatable contingent time and space. Captured on video, the documentary traces of these performances are available to be experienced in new ways and to keep challenging colonialism, authoritarianism, classism, masculinism, and heterosexism (Jones 1997).

Mapping New Knowledges

In addition to rescuing artists’ and activists’ work, the digital archive activates the political potential of the interactions between web users and video documentation given that “the televisual image is not only a reproduction or repetition of a performance, but a performance in itself” (Auslander 1999, 44). This medium challenges the idea of artwork as a mere object of analysis: the artwork and its documentation both demand an active
engagement from audiences. The connections that emerge between different works can ignite new ways of thinking and understanding the role of embodied art in contemporary society. Accordingly, by making artists’ work accessible, HIDVL contributes to articulating new sites of knowledge production. This project is particularly groundbreaking when taking into consideration LGBTQ artists and activists of color, whose work has been marginalized from the canon due to prejudices on gender, sexuality, race, and ethnicity. LGBTQ communities reflect upon and from the peripheral space to which their bodies have been marginalized, and in so doing, they challenge normative conventions regarding ways of being and knowing. In this sense, embodied practices produce new knowledge, and new knowledge requires new archives. In a dynamic and productive interrelation, the digital archive preserves and potentiates the repertoire, and the repertoire animates and expands the digital archive.

These interconnections become more relevant when talking about the digital archive of embodied practices by artists whose proposals intersect art, scholarship, and activism. This is the case with La Pocha Nostra, a transdisciplinary arts organization, founded in 1993 by Guillermo Gómez-Peña, Roberto Sifuentes, and Nola Mariano in California. La Pocha Nostra comprises a network of artists from various generations and ethnic backgrounds whose common denominator is the desire to cross and erase borders between art and politics, practice and theory, artist and spectator. Their artistic proposals range from performance solos and duets to large-scale performance installations including video, photography, audio, and cyberart. These projects challenge constructed binaries and barriers around culture, ethnicity, gender, and language. Interestingly, La Pocha Nostra constantly performs the very theoretical-political concept that appeals to scholars and activists alike: learning to cross borders of all types on stage might bring about the possibility of learning how to do so in larger social spheres. Gómez-Peña and Sifuentes have systematized part of the findings that come from their artistic work through scholarly essays and books sharing the theory and practice of being a “rebel artist.”

In the southern side of the Americas, the feminist anarchist movement Mujeres Creando (Women Creating) also has produced new forms of knowledge through art and activism. Created in 1990 in La Paz, Bolivia, Mujeres Creando comprises women of different cultural, social, and ethnic origins and explores art as an instrument of resistance and social participation. The three women who founded this communitarian proposal (María Galindo, Julieta Paredes, and Mónica Mendoza) worked together to recover the public space that the patriarchal system appropriated. In this sense, the group not only struggles for women’s rights and issues that affect women but also stands up against a system that disenfranchises a large part of Bolivian society. Mujeres Creando’s means of expression are graffiti, ongoing public debates, and public performance art along with a constant presence in the streets to reclaim a voice and participation in the public sphere. In April 2001, due to ethical and political disagreements, the group divided, which brought the necessity to differentiate names. After this divergence, Galindo continued working with
Mujeres Creando in Bolivia while Paredes founded another collective, Mujeres Creando Comunidad (Women Creating Community).

Both Galindo and Paredes have published scholarly and political writings discussing the marginalization of women in society and the struggle to overcome being stigmatized based on sexual orientation. In one of their early street performances (or acciones), during the first cycle of Mujeres Creando, Galindo and Paredes took over a public square, drew a red heart on the pavement, set a mattress and sheets in the middle of the heart, and lay in that improvised bed, holding hands and kissing, while their collaborators handed flowers to the passersby. The expressions of disgust and negative judgment from some members of this audience, even when listening to the words of love and acceptance that accompanied the acción, demonstrate that the struggle for the right to freely choose gender and sexual identity intensifies within a patriarchal, neoliberal, and neocolonial political system. In later works, Paredes has explored Aymara sociopolitical systems in search of alternative knowledges that offer ways to achieve social justice, which is part of her proposal of “communitarian feminism.”

Queering Latinx America

© PEDRO GONZALEZ/LATINCONTENT/GETTY IMAGES
Astrid Hadad Performing in Her Show Tierra Misteriosa (Mysterious Land) in Mexico City, Mexico, 2011. The queer, Mexican-themed work of singer and performance artist Astrid Hadad is archived online in the Hemispheric Institute Digital Video Library, which brings the role of women artists to the forefront in remapping the Americas’ knowledges and political practices.
HIDVL brings the role of women artists to the forefront in remapping the knowledges and political practices of the Americas. Among Latin American and Latinx (a gender-neutral way to express Latina/o identity) artists, women have not shied away from the task of queering pervasive normative assumptions—understanding *queer* as an active verb instead of a passive adjective. The act of *queering* the world is a political one in the sense that it challenges the norm and turns it upside down in order to imagine and to think otherwise (Muñoz 1999). Mexican singer and performance artist Astrid Hadad queers the female/male binary and its prevalence in her country's history. Hadad’s own body becomes a human, mobile stage, an altar and a life sculpture. Mexico’s iconography, like the cactus, the pyramid, and the tequila bottle, as well as several iterations of the Virgin of Guadalupe and guns, appear as common places to be subverted and reconfigured. Like those of Carmelita Tropicana, her shows follow the format of a cabaret, in which Hadad and her band, Los Tarzanes, create a space of intimacy while at the same time showcasing a diva-persona with stunning vocals and elaborate costumes. Through her voice and her body, Hadad challenges the audience to accompany her in the performance of queering social expectations. Most of her work challenges cultural norms pertaining to gender roles in Mexican society, and she also addresses issues related to US neo-imperialism.

Multiple artists from the United States have been included in HIDVL, in accordance with its hemispheric approach. Among these artists, the work of Latinx subjects reveals the complexities of being part of a minority group from where challenge and resistance can be performed. For example, Nao Bustamante is an internationally known performance artist from California. Her work often contests traditional roles for women and questions what it means to be a US American in relation with Latinx heritage. She also interrogates the assumptions around the “Latina” body, putting the audience, and often her own body, in vulnerable positions. In her piece *America, the Beautiful*, Bustamante cinches her entire body with cling wrap while balancing in high heels on a folding ladder. Donning a blond wig and wearing heavy makeup, her presence on stage fluctuates in-between what is laughable and admirable, thus transforming precariousness into defiance. Bustamante demands extreme tasks from her body on stage in the same manner as society demands gendered and racialized bodies to overperform in terms of labor, physical appearance, and sexual desire.

Another artist who explores issues related to being Latinx in the United States is Susana Cook, a New York–based Argentine theater and performance artist whose work tackles sexuality, gender, homophobia, racism, nationalism, and dictatorship. Mainly directed to queer and Latinx communities in New York City, Cook’s work also encompasses a passionate response to state policies that oppress communities identified in the intersection of race, gender, and class. In her shows, Cook parodies discourses of power drawing attention to the close ties between religious and political conservatism and the military. In *The Fury of the Gods*, Cook brings the figure of the evangelical fundamentalist preacher to its most extreme expression dismantling the contradictory logics of a discourse
that predicates love while attacking the LGBTQ community. Humor is at the center of this political satire, which is described in the HIDVL site as an “exercise in Pop Blasphemy,” as well as amusing absurdity on stage that highlights the power of comedy to contest prejudice and authoritarianism. Her plays usually feature all-women casts that defy normative stereotypes of gender, race, and sexuality.

Both Bustamante and Cook are examples of artists who rewrite recent political history from the narratives that surface from their bodily presence on stage. Their relation with Latin American and Latinx history comes from and invites bodily responses that are themselves a form of understanding that history and their place within it. They perform a form of what Elizabeth Freeman calls “erotohistoriography” that “sees the body as a method, and historical consciousness as something intimately involved with corporeal sensations” (2010, 95–96). The digital archive of their performances contributes to this form of approaching recent historical events and reaffirms the political potential of the act of queering.

**Performing Art and Resistance**

The artists’ work featured in the HIDVL platform is innovative, challenging, and visionary. This work is a reminder that the very definition of the virtual implies that everything is possible (Case 2007). Whereas the virtual, as opposed to the “actual,” presents the potentiality of political imagination, the digital has become the most effective tool to access the virtual. In the case of the video collections archived in HIDVL, this accessibility functions on two levels: on the one hand, digital videography records and documents performances that outline better ways to live in society; on the other hand, these video materials reach out to a broader audience by being accessible worldwide through internet connections. This combination plays a relevant role in present times when digital networks and social media are already reshaping modes of political participation.

One of HIDVL’s best-known video collections is El Hábito, which comprises fifteen years of a political cabaret run by Mexican artist Jesusa Rodríguez and her partner Liliana Felipe. Rodríguez is a director, actress, playwright, performance artist, set designer, entrepreneur, and social activist. Her shows challenge traditional classification, as well as traditional gender roles. Humor, satire, linguistic puns, and the political potential of the body are constants in her productions. Felipe, one of Latin America’s leading singers and composers, was born in Argentina. She left for Mexico just before the outbreak of the “Dirty War” in 1976, but part of her family remains “disappeared” as victims of the military dictatorship's criminal politics. She continues working with human rights organizations in Argentina, especially H.I.J.O.S. (Hijos e Hijas por la Identidad y la Justicia contra el Olvido y el Silencio [Sons and Daughters for Identity and Justice against Oblivion and Silence], the organization of the children of the disappeared). Together, Rodríguez and Felipe created two performance spaces, El Cuervo and El Hábito in Coyoacán, Mexico City, which they ran until
2005 when their collaborators, Las Reinas Chulas, took it over and renamed the cabaret El Vicio. El Hábito/El Vicio is a cultural hub for intellectuals, feminists, gay rights activists, and all sorts of people who are open to understanding that critical humor can also be a form of knowledge and political resistance.

As of 2018, Rodríguez and Felipe continue working on live performances while also recording and archiving their work in HIDVL and the Hemispheric Institute's multiple digital platforms. Both their bodily work and its rendering into new visual and digital technologies are part of a larger set of practices that are generating new epistemologies, new forms of being in the world, and new ways of embracing the productive challenges ignited by LGBTQ artists and activists. Digital video archives are ultimately rooted in the body, and the existence of physical spaces of encounter like El Hábito cabaret is a reminder that there is always a return to that body. HIDVL suggests that performance and politics as acts of resistance remain in those in-between spaces of the digital, the embodied, the virtual, and the actual.

**New Cultural Maps in the Digital Humanities**

HIDVL video collections are linked to HemiPress, the Hemispheric Institute's digital publications imprint that centralizes the institute’s diverse publication initiatives. HemiPress uses a variety of customized open-source digital humanities platforms keeping the original goal of connecting communities of readers, scholars, artists, and activists across the Americas. These platforms are generating new cultural maps through networked relations and associations. In other words, through bodily performance and its digital archiving and consequent dissemination, these digital humanities projects are “remapping the Americas” (Taylor 2007). Moreover, their interconnections offer a possible integration of virtual communities, becoming a “public space in gestation” (Barbero 2000).

HIDVL unceasingly grows, expands, and produces new relational links. Digital archives engender an expandable scope of virtual cross-references—a rhizomatic activity that might contain in itself productive and reproductive dynamics that strengthen and expand the scope of performance and politics. Interestingly, these prospects of political freedom rely on the model of the rhizome that different networks are currently acquiring (Deleuze and Guattari 1987). A rhizomatic model is expandable and nonpredictable; in this sense, this same system would be able to shelter multiple, unexpected, and extensive acts of resistance against global trends of authoritarianism. In other words, digital archives generate new “constellations” of performance, art, and activism— all spaces that interconnect and collaborate to create acts of resistance (Fuentes 2015).

In HIDVL, various epistemic systems—the written, the performed, the digital—work together in the transmission of knowledge. HIDVL makes accessible the bodily practices of minoritarian communities, artists, and activists. Digital technologies both serve and
challenge the humanities and political responses to current times while expanding artistic and cultural/academic archives. The embodied knowledge associated with performance and the sanctioned knowledge of the written archive have, in the digital format, a new space to keep rewriting and queering history.

Hena Maysara (2007; Khaled Youssef)

MIRAL MAHGOUB AL-TAHAWY
Associate Professor of Modern Arabic Literature, School of International Letters and Cultures
Arizona State University, Tempe

Egyptian film that shocked many with its depiction of a lesbian encounter.

_Hena maysara_ is an Egyptian social and political film directed by Khaled Youssef, written by Nasser Abdel Rahman, and produced by Albatrous Film Production in 2007. The film was awarded the prize for best film at the 14th Cairo National Festival for Egyptian Cinema. The film discusses the state of and the morality in Egypt's slum city (Manatiq al-‘Ashwa’iyya), which consists of those poor areas on the outskirts of Cairo lacking the most basic infrastructure services and means of livelihood. Those areas are occupied by poor families who suffer social and economic marginalization. According to the Egypt-based journalist Mariam Musa (2015), “Slum areas started to crop up in Cairo in the 1950s, for a variety of reasons, including the internal migration of Egyptians seeking better living conditions, the expansion of the capitalist economy, overpopulation, and high birth rates.” Poor houses and inefficiently constructed, crowded rooms compose these informal settlements, where most residents are unemployed or work in very low-wage jobs and suffer a state of total or near-total economic and social exclusion. Slums create an environment leading to the occurrence of many crimes, such as violence, burglary, and sexual abuse of women and children, along with a high incidence of drug addiction. Because of the lawlessness and lack of security in these areas, these slums have also been centers of police brutality. According to David Sims (2010), Cairo’s slum areas have developed only since 1960. Not until the second decade of the twenty-first century, however, did the nature and dynamics of the poverty and social deprivation in slum areas become central to many in-depth studies, particularly given their correlation with the rise of the Arab Spring (a series of popular uprisings that occurred in the Middle East and North Africa starting in late 2010).

_Hena maysara_ broke the silence surrounding these communities, tackling systemic violence—sexual harassment, rape, prostitution, and human trafficking—along with street children, incest, and other social problems, including drug smuggling and terrorist activities of extremist groups among Cairo's marginalized communities. The movie presents a realistic portrayal of the disintegrating social dynamics and moral states that result from living in such excluded areas, dealing with the agony, poverty, and economic and social pressures of life in slums. It also daringly deals with untold problematic issues, such as psychological and sexual deviations, that Egyptian cinema did not previously broach, zooming into the
slum areas to highlight the correlations between living (surviving) below the poverty line and risky sexual behaviors, with particular attention to homosexual prostitution as one of the many sexual services found in slums.

**The Film’s Plot**

The stories depicted in *Hena maysara* revolve around two main characters. The first is Nahed, who runs away from her home to escape her stepfather’s sexual harassment. She is exposed to harassment in her escape, too, and is even raped. She meets the second main character, Adel Hashisha, and falls in love with him. Adel is unemployed and doing odd jobs to support his mother and his brother's children. His brother, Reda, traveled to Iraq for work but has since gone missing in the chaos of the Persian Gulf War (1990–1991). The family is therefore forever awaiting his return. Adel's brother represents the hope that this family's dreams will come true with his return. However, he returns only in his mother’s dreams. Adel shoulders all responsibilities of his family; he cannot give up his role of providing for this large family, as they are totally dependent on him. He therefore cannot marry Nahed. The emotional and sexual relationship continues between them until she gets pregnant. She asks him to marry her and acknowledge paternity, but under the pressures of unemployment, poverty, and lack of proper shelter, he cannot be responsible for a wife. He tells her that he will marry her *hena maysara*, which means “when things get better” in Arabic. This phrase, which is also the title of the film, carries the connotation that poor people are forever waiting for the realization of their deferred dreams. For slum people, all dreams are postponed, whether drinking clean water or working and finding a place to live. All hopes are postponed to the future.

Although Adel makes this promise to Nahed, he fails to fulfill it, leaving her alone with the child. She therefore abandons their child on public transportation, feeling guilty and remorseful for leaving him to the streets but seeing no alternative. She then attempts to survive by looking for a job and a shelter, but as a woman she is always subject to sexual exploitation by the men she meets and trusts and even by some women. She is raped, harassed, and exposed to physical violence and finds no way forward but to become an exotic dancer, or stripper, and, finally, a professional prostitute, which brings with it other troubles connected to sex work. Her journey ends with her escaping from police officers as they chase her; simultaneously, her homeless child, now a street kid, also lives his life escaping from the police and the sexual violence of his fellow street kids. As for Adel, he, too, is transformed out of necessity from doing odd jobs to being a drug smuggler and becoming one of his neighborhood’s top thugs. He also becomes a police informant and an accomplice to religious extremist groups that have been on the rise in his slum area. At the end of the movie, Adel is forced, under brutality from police officers who targeted his family while looking for him, to flee these affiliations by running to catch a train. That train is physically and metaphorically where all their lives reconnect: Nahed is in another car on
that same train, also being chased; and their son, by then a young man, also sits atop that same train as it departs to nowhere in particular. In this way, father, mother, and son each escape their tragic past but still lack any clear destination away from the slum.

**Varied Reactions from Film Critics**

Controversy arose among film critics around this movie’s artistic value and perspective, especially addressing homosexuality and other risky sexual behaviors occurring in slum areas. Some considered it an important, daring film that addresses problems Egyptian society suffers under; critics praised its boldness, arguing that *Hena maysara* presents a reality that must be dealt with, even though the film presented not even a fraction of the complete picture of slum communities (*Warwārī 2008*). Additionally, they considered it a precursor to the 2011 Egyptian uprising against Hosni Mubarak’s regime popularly known as the 25 January Revolution, arguing that the movie shed light on the state’s preoccupation with regime security measures, the corruption within the security apparatus, the wide gap between social classes, and a general sense of destitution (*El Shimi 2016*).

On the other side, some critics accused the film of using homosexuality and other sexual references for crude commercial ends, pointing out its failure in terms of the weakness of its screenplay and its many plot loopholes, including disconnected time jumps, weak links between events, and mediocre dialogue (*Baba 2008*). These critics judged the film from both artistic and moralistic points of view, noting its destruction of social values and focus on sexual scenes (*al-Wirr 2016*).

These same critics claim that the film approaches too superficially the circumstances that push the protagonist, a simple country girl, toward immorality and same-sex prostitution. They note that the film is full of melodrama and tries to raise too many issues, relying on sweeping generalizations and superficial approaches. The main characters do not have sufficient opportunity to develop and become relatable in context; their transformations are abrupt, confusing, and sometimes artificial, superficially treating social reality. They also point out that the screenplay relies, on the one hand, on stereotypical images of women living in poverty and of risky sexual behaviors (including homosexuality as a form of prostitution) and, on the other, depicts brutality at the hands of the security apparatus when portraying the relationship between corruption, thuggery, and the growth of power within terrorist Islamic groups.

**Controversial Scene Involving Lesbian Encounter**

On a different level, the film stirred a lot of anger among al-Azhar University scholars in Egypt about one homosexual scene featuring a brief kiss between two women. It showed how the main character, Nahed, was seduced by an upperclass woman interested in a homosexual relationship with her, exploiting Nahed’s body in return for giving her shelter.
The scene is marginal within the dramatic structure of the film, but it aroused a lot of social controversy. Although it was not the first time homosexuality was tackled in Egyptian cinema, previous depictions had been between men, as for example in the 2006 film *Imarat Ya'qubian* (*The Yacoubian Building*). *Hena maysara's* depiction of lesbianism, however, constituted a shock to viewers. The film's lead actress, Sumaya al Khashab, defended how the lesbian scene was filmed, saying, “The scene was not obscene or indecent. On the contrary, it was very realistic and crucial in the film's dramatic context… Whoever watches the film will perceive the scene as natural in the context of the film's plotline and … not placed artificially for mere eroticism” (*al-Arabiya* 2008).

Accusations reached a boiling point when some Al-Azhari scholars called for the director and actresses to be prosecuted. The director was accused of tarnishing the image of Egyptian society and spreading vice and obscenity. For instance, Abdel-Sabour Shahin, a preacher and Islamic studies professor at Cairo University, called on authorities to prosecute the director and the two actresses, Ghada Abdel Razek and Sumaya al Khashab, for enacting the lesbian encounter, which he claimed was moral depravity on the big screen. He publicly claimed that “a Zionist and American conspiracy” is behind such degenerate films as part of a scheme to destroy social morality (*al-Arabiya* 2008). Elwi Amin, a professor of Islamic law at Al-Azhar University, also claimed that the film's sexual and lesbian scenes open the door to sin and moral corruption, that lesbianism does not exist in Egyptian society, and that “presenting sexual and lesbian scenes on TV and in the cinema is a sin. Watching them is also a sin” (*al-Arabiya* 2008).
Women Walk Past a Movie Poster for Hena Maysara at a Movie Theater in Cairo, Egypt, 2008. When
Hena maysara was released in 2007, some critics praised it for its daring depiction of the problems faced by
marginalized groups in Egyptian society. The movie also drew the ire of religious scholars, who claimed that
it spread vice and obscenity in its portrayal of a lesbian encounter.

Khaled Youssef, the film’s director, defended *Hena maysara* by denying this accusation. He
claimed that homosexuality was not his main concern and that his intention was to present
the realities facing marginalized groups and describe the life of slum residents, including
risky sexual behaviors that are part of that reality. The film’s focus was the social problem:
how to portray these people’s lives in full without distortion or misrepresentation. Youssef
said that the homosexual scenes of the film at the center of the controversy are simply a
reflection of reality and that the reality behind this portrayal could, in fact, be even more
shocking. In the film, he calls for a redressing of the situation, not spreading homosexuality
or thuggery. He is drawing attention to a time bomb present in Egyptian society. He asked
those objecting to the film to watch it first, then discuss its story line and scenes, because he
would not respond to criticisms leveled against the film by those who did not watch it. In a
newspaper interview, Youssef said that some people accuse him of being an infidel and
filming sinful scenes, although they never watched his films in the first place. Instead, they
judge only from what they see on the film’s poster (*Marus and Gafur 2009*).

**Female Homosexuality and Class Issues**

Regardless of the degree of eroticism in the scene, the way the script tackles homosexual
desire comes in the context of class: same-sex desire is depicted as an exploitation of the
heroine’s need for shelter. After Nahed is kicked out of the place where she used to work as
a cleaning lady, she finds herself on the train with no money to pay for the ticket. At this
point, a rich woman offers to pay for her ticket and then empathizes with her, offering to
give her shelter at her home. At the house, the woman becomes aroused at the sight of
Nahed exiting a shower nearly naked and starts to approach her sexually. Nahed does not
seem to mind or reject these approaches but is responsive to them and even enjoys them,
until the two women get to bed. For a few moments, they seem to be continuing the
foreplay, but Nahed suddenly gets up, blurtling out, “You all desire my flesh, men or
women,” to which the woman responds vehemently, “Do you have anything else worth
desiring?” The scene ends here, and Nahed leaves for the street again, looking for shelter.

A wealthy woman who enjoys many pleasures of life desires the body of the broken woman
living on the street and leverages her financial need to selfish ends. The paradox is that
Nahed’s rejection of this shameful, immoral, and exploitative sexual relationship
contradicts her approval of selling her body and using it for paid sex. In the latter case,
however, she bargains with and exploits others just as she is exploited, acquiescing to the
rules of being taken advantage of. It would seem that, in fact, the film’s presentation of
lesbianism is in harmony with social values that deem homosexuality a forbidden and
deviant desire. Moreover, the script does not highlight the character of this lady who makes
sexual advances toward Nahed. It does not depict any psychological or sexual aspects to the woman’s desire for Nahed. The woman is even outspoken about her exploitation of Nahed in stating that Nahed does not own anything but her body, which she sells as she looks for shelter away from the cruelty of the streets.

In *Hena maysara*, female homosexuality is characterized by and limited to class exploitation rooted in economic disparity: it is not about desire but about commodity. The lower class is used by the bourgeoisie for homosexual relationships in encounters that clearly portray sex and sexual services as the only thing of value that a poor girl has to offer to a member of the upper class. It is financial need that pushes Nahed to accept her role as a sexual servant, where her body is exploited at her will or against it, which inevitably leads her to be a victim of violent rape by a client, a reality facing those with no choice besides prostitution. In the end, when Nahed finally accepts becoming a stripper and a sex worker, she accepts that selling her body and allowing it to be used by those seeking paid sex means that, like any businesswoman, she trades in supply and demand. In the script, the lesbian scene is simply part of a series of sexual assaults that this village girl, who owns nothing but her body, is subjected to. But ironically, the only things that Nahed rejects of all this violence are group rape and lesbian sex, both of which represent forced encounters in the context of violence and deep shame, which Nahed violently resists.

Regardless of the superficial and stereotypical ways in which the director highlighted critical issues, including sexual violence, sex trafficking, and homosexual prostitution in connection with poverty and human needs, *Hena maysara* brings into clearer view that sexual exploitation is inherent in Egypt and systemic within the Middle East in general. In fact, the film’s use of sexual issues raises awareness of deeply embedded economic and political realities, as well as how volatile they can be within slum areas. The film also makes it clearer to the audience that slum areas are great crucibles and indicators of the fertile intersection of terrorist activity, drug trafficking, and same-sex prostitution, as well as social and economic indicators predictive of conflicts that would feed a deeply rooted anger and the 2011 Egyptian uprising that was part of the Arab Spring while clarifying from whence they came.

Higher Education and LGBTQ+ Communities in the United States

GENNY BEEMYN
Director, The Stonewall Center
University of Massachusetts Amherst

The relationship between US institutions of higher learning and their LGBTQ+ students and staff, both historically and in the twenty-first century.

While many American colleges and universities provide at least some support to their LGBTQ+ students, staff, and faculty today, institutions of higher education were initially resistant if not antagonistic to the needs of the LGBTQ+ people on their campuses. Only after persistent advocacy from LGBTQ+ communities and cisgender (nontransgender), heterosexual supporters did colleges begin to establish LGBTQ+ centers and studies programs, recognize LGBTQ+ people in programming and services, and make institutional policies more inclusive. But, in spite of this progress, the environment at many colleges remains largely hostile to LGBTQ+ people, and no institution can honestly be said to be doing enough to recognize, involve, and provide for its LGBTQ+ students, staff, and faculty.

LGB/LGBT Student Groups

Until the late 1960s, same-sex sexuality, which was often regarded as immoral behavior or a psychiatric disorder in the dominant society, was grounds for expulsion from many colleges. The students who were not dismissed for being known or thought to have engaged in same-sex sexual relationships were often sanctioned in other ways, particularly by being forced to receive counseling to be “cured.” For example, students at the University of Florida who were caught up in an antigay witch hunt carried out by a secret Florida legislative committee in the late 1950s and early 1960s were told that they could remain at the university only if they submitted to regular psychiatric treatments at the campus health clinic (Schnur 1997).

The rise of lesbian, gay, and bisexual (LGB) activism on college campuses in the late 1960s and early 1970s provided the students with greater opportunities to meet, develop communities, and advocate for an end to discrimination from administrators. But most institution officials were unmoved, and colleges often sought to prevent LGB student groups from being recognized, funded, or from holding events. The first LGB college student group in the United States, the Student Homophile League (SHL), was started in 1966 by Stephen Donaldson (1946–1996), an openly bisexual student at Columbia
University. He had been involved in the New York City chapter of the Mattachine Society and wanted to create a similar homophile organization on campus. Columbia initially refused to recognize the SHL, and only did so the following year when the university administration could find no legal reason to deny chartering the group. Following this breakthrough, other chapters of the SHL were formed at Cornell University and New York University in 1968 and at the Massachusetts Institute of Technology in the spring of 1969. Similar groups not affiliated with SHL were organized in early 1969 at the City University of New York and the University of Minnesota (Beemyn 2003).

In the aftermath of the Stonewall riots in New York City in June 1969 and the subsequent growth of LGB activism nationally, the number of LGB student organizations proliferated. In a front-page article in 1971, the New York Times alerted its readers that “thousands of college students are proclaiming their homosexuality and openly organizing ‘gay’ groups on large and small campuses across the country” (Reinhold 1971, 1). Such groups were estimated to exist at 150 colleges and universities.

At the same time, other colleges refused to recognize, fund, or provide equal treatment for their LGB student groups, which, in some instances, led the students to file lawsuits to gain their rights. The courts have consistently held that colleges cannot treat LGB student groups differently from other recognized student groups (Dilley 2002). Even institutions affiliated with conservative religions have been found to have an obligation not to discriminate against their LGB student organizations. For example, after a protracted legal struggle, the District of Columbia Court of Appeals ruled in 1987 that Georgetown University had to grant campus LGB groups the same privileges as other registered student groups, even if the institution chose not to recognize the groups officially because of traditional Catholic beliefs opposing same-sex sexuality. Since then, Georgetown, like many other Catholic colleges, has granted full, formal recognition to its LGBTQ+ student groups. But most evangelical Christian and Orthodox Jewish colleges still have codes of conduct that prohibit same-sex sexual relationships, which can result in students being disciplined or expelled if they are known or thought to have violated the bans. Religiously conservative institutions have also cited school doctrine to dismiss or openly discriminate against trans students (Marine 2011; New Ways Ministry 2017).

The first LGB student groups to formally include trans people in their names and mission statements and the first trans-specific student groups were formed on college campuses in the late 1990s and early in the next decade, as more trans students began to disclose their gender identities and sought to create institutional spaces for themselves. However, some of the newly named LGBTQ student groups marginalized their trans members by misgendering them and continuing to focus exclusively on sexuality-related issues. Not until the 2010s did many LGBTQ campus organizations become truly trans-inclusive, due to the growing number of trans students in these groups and a growing awareness of trans experiences among cisgender LGB youth (Beemyn and Rankin 2018).
LGBTQ+ Support Services

Beginning in the 1970s, some colleges started to offer visible support to their LGB students, most notably the University of Michigan, which, in response to student advocacy, established a Human Sexuality Office in 1971. It became the first LGB-focused campus office in the country, followed by the Alternative Lifestyles Office at Minnesota State University, Mankato, in 1977. Three other professionally staffed LGB college offices were created in the 1980s: at the University of Pennsylvania (1982), the University of Massachusetts Amherst (1985), and Princeton University (1989). In the 1990s, as LGBTQ+ students became more visible on campuses throughout the country and organized to have their needs met, significantly more colleges began to provide LGBTQ+-specific administrative support services (Beemyn 2002). As of 2018, more than 260 US colleges and universities have established LGBTQ+ centers or offices with at least a half-time director, and more than 800 individuals belong to the Consortium of Higher Education LGBT Resource Professionals, the organization for people working in LGBTQ+ student services, which was formed in 1997 (Campus LGBTQ Centers Directory; Consortium of Higher Education LGBT Resource Professionals).

LGBTQ+ Studies Programs

The establishment of LGBT or queer studies courses and programs followed a pattern similar to the creation of LGBTQ+ student groups. While “homosexuality” had long been a subject of classroom discussion, colleges and universities did not begin to offer courses specifically focused on the lives of LGBTQ+ people until the early 1970s, when students started to demand such courses and some younger faculty and graduate students took an interest in teaching the subject. At some colleges, the introduction of LGBTQ+ courses was impeded by conservative administrators and faculty members who questioned their legitimacy and academic rigor. But as scholarly research in LGBT studies steadily increased in the 1970s and 1980s, challenges to its worthiness as an area of study waned, and more and more courses were developed based on the growing body of literature in the field.

By the 1990s, institutions with an extensive number of LGBT courses began to offer a program of study. The first lesbian, gay, and bisexual studies department was established at the City College of San Francisco in 1989. Other early programs included the Lesbian and Gay Studies Center at Yale University, begun in 1986, and the Center for Lesbian and Gay Studies at the City University of New York, founded in 1991. In addition to the City College of San Francisco, Hobart and William Smith Colleges and San Diego State University offer an undergraduate degree in LGBT studies, and dozens of other colleges, including the State University of New York Purchase, the University of Chicago, and New York University, offer a major in gender and sexuality studies. Many more institutions offer a minor, certificate, or concentration in the field (Younger 2017).
In the early twenty-first century, transgender studies emerged as its own discipline, fueled by the publication of critical texts in the field, including Joanne Meyerowitz’s *How Sex Changed: A History of Transsexuality in the United States* (2002), Susan Stryker and Stephen Whittle’s *The Transgender Studies Reader* (2006), and Stryker’s *Transgender History* (2008), as well as a rapidly growing number of journal articles. In 2013 the University of Arizona hired the first group of faculty in trans studies as part of its Transgender Studies Initiative, and in 2014 Duke University Press began *TSQ: Transgender Studies Quarterly*, the first nonmedical academic journal in the field, edited by Stryker and Paisley Currah. Today, studies on trans issues are common in journals and at conferences in the arts and humanities, social sciences, and education; expertise in trans studies is a desired qualification for many new faculty hires in these disciplines; and most LGBT studies and gender and sexuality studies programs offer at least one course on trans experiences (Stryker 2017).

**Creating LGB-Supportive Campus Climate: The 1990s and First Decade of the Twenty-First Century**

Beginning in the 1990s and accelerating in the next decade, colleges began to make institutional changes to improve their climates for LGB students, staff, and faculty, such as adding “sexual orientation” to their nondiscrimination policies, starting to offer LGB-related training sessions, and, in the absence of a right to same-sex marriage, providing domestic partnership benefits to the same-sex partners of students and employees. For example, in the early 1990s, only about 250 colleges explicitly prohibited discrimination based on sexual orientation, and by 2001, that number had risen to only about 336 institutions. But over the following decade, hundreds of colleges added “sexual orientation” to their nondiscrimination policies (HRC Foundation 2001; Watkins 1998).

**Allyship Training Programs** Similarly, in the early 1990s, a few colleges, including Ball State University in Muncie, Indiana, started offering safe zone or safe space ally programs to educate members of their campus communities about the lives of LGBTQ+ people in an effort to improve their institutional climates. By 2000, at least sixty colleges had ally training programs as a result of a greater awareness of hate crimes against LGBTQ+ youth following the widespread coverage of the hate-related murder of Matthew Shepard (a gay student at the University of Wyoming) in 1998 and the rise in the number of LGBTQ+ campus centers, which often created and administered the training. Many more ally programs were developed in the first decade of the twenty-first century, as even more centers were established and as having such a program became a best practice for supporting LGBTQ+ students, staff, and faculty on college campuses (Poynter and Tubbs 2007; Tubbs 2000).

**Domestic Partnership Benefits** With popular opinion today strongly in favor of equal
marriage rights, and with same-sex marriage having become legal in every state following the US Supreme Court’s 2015 decision in Obergefell v. Hodges, younger readers may have difficulty understanding that even extending medical and dental insurance, tuition assistance, and other benefits to the same-sex partners of campus employees was extremely controversial in the 1980s and 1990s. Opponents of domestic partnership benefits often objected to what they saw as institutions of higher education endorsing homosexuality by recognizing and rewarding same-sex sexual relationships. But as general public support for equal rights for lesbians, gay men, and bisexuals grew, this argument became harder to make outside of religiously affiliated schools and public universities that were overseen by conservative trustees and state legislatures. After the City College of San Francisco became the first school to extend spousal coverage to its LGB employees in 1991, the number of institutions offering domestic partnership benefits grew rapidly. Before states began legalizing same-sex marriage in the first decade of the twenty-first century, approximately 30 percent of colleges and universities offered domestic partnership benefits, including the school systems of the State University of New York, the City University of New York, the University of California, the University of Michigan, and the University of Maine.

Creating a Trans-Supportive Campus Climate
Colleges were much slower to recognize and address the needs of their trans students, staff, and faculty. Prior to the twenty-first century, few trans people were out on college campuses and in a position to challenge the hostile climates they experienced at their institutions and advocate for trans supportive policies. It was because the environment at most colleges was so negative, of course, that most trans students, staff, and faculty did not disclose their gender identities. Moreover, most cisgender campus community members failed to recognize, much less address, institutional genderism because they were not directly affected by it.

It was not until late in the first decade of the twenty-first century and early 2010s that more than a handful of colleges started to take steps to support their trans populations, primarily in response to a growing number of students beginning to identify, be out as trans, and request that their institutions become more trans inclusive. In 2005 fewer than twenty colleges had “gender identity” in their nondiscrimination policy (starting with the University of Iowa in 1996); only one college, Wesleyan University, provided a gender-inclusive housing option; and no college allowed trans students to use a name other than their legal name on campus records and documents, or covered hormones and gender-affirming surgeries under student health insurance (Beemyn 2019).

More than a dozen years later, the policy landscape has shifted significantly. For example, more than 1,000 colleges now specifically include “gender identity” in their nondiscrimination policy; more than 250 have some form of gender-inclusive housing; about the same number enable students to use a chosen name instead of their “dead name” (the name they were given at birth) on campus records and documents; and at least seventy-five cover hormone-replacement therapy and gender-affirming surgeries under student health insurance (Campus Pride Trans Policy Clearinghouse 2017). The growing number of colleges that are addressing the needs of their trans students is also reflected on the Campus Pride Index, a tool for measuring the extent to which colleges have LGBTQ+-inclusive policies and practices. In 2017, twenty-five colleges, a record number, earned the index's highest rating of five stars.

**Restroom Access** Another way that some colleges have responded to advocacy by members of their trans communities is by creating gender-inclusive restrooms (single-user and sometimes multiple-user facilities that are available to individuals of all genders) across their campuses. For example, the University of Massachusetts Amherst has established more than 150 gender-inclusive restrooms in academic buildings, and the University of Oregon has more than 100 such restrooms. In addition, the University of Massachusetts Amherst, the University of Arizona, Gettysburg College, and a handful of other institutions have enacted formal policies stating that students, staff, faculty, and guests have the right to use gendered campus restrooms in keeping with their gender identity. These policies represent an important institutional commitment to trans people at a time when the federal executive branch is allowing discrimination against trans students
Trans Students in Athletics Along with gender-inclusive restrooms, some colleges are creating gender-inclusive locker rooms (i.e., individual changing and shower areas), and by 2017 at least seventeen institutions had enacted guidelines for supporting trans students in campus athletics (Campus Pride Trans Policy Clearinghouse 2017). Colleges that do not have such guidelines must still follow the trans athlete policies of national athletic associations and college sport governing bodies that dictate the conditions under which a trans student can participate on a women’s, men’s, or mixed-gender team. For example, the guidelines of the National Collegiate Athletic Association (NCAA), which were published in 2011, require a trans man who decides to have hormone replacement therapy to compete on a men’s team as soon as he begins hormones and a trans woman who decides to have hormone replacement therapy to take hormones for one year before she competes on a women’s team (Griffin and Carroll 2011). Openly trans college athletes have included Kye Allums, a trans man who played women’s basketball at George Washington University before medically transitioning, and Schuyler Bailar, a trans male swimmer at Harvard University.

The Continued Exclusion of Trans People in Higher Education The ability of trans women and trans men to play collegiate athletics shows how higher education is becoming more trans inclusive, but also how it remains mired in a gender binary. Just as nonbinary trans students cannot compete as themselves when teams are limited to women and men, they continue to be marginalized and invisible in other gender-segregated spaces, such as in fraternities and sororities, in some student groups, and in college traditions that make gender distinctions (e.g., having a homecoming “king” and “queen”). Nonbinary trans students are also invisible in the classroom, as only about fifteen colleges currently give students the ability to indicate their pronouns of choice on course rosters; in the absence of this information, relatively few instructors ask students to share their pronouns (Campus Pride Trans Policy Clearinghouse 2017). As a result, nonbinary trans students and some trans women and men are regularly misgendered in classes, which can adversely affect both their academic performance and their emotional and mental health (Beemyn 2019; Pryor 2015).

The negative experiences of nonbinary students demonstrate the extent to which all colleges still have a long way to go to become truly trans supportive. This is especially the case for institutions affiliated with evangelical religions, community and for-profit colleges, and smaller colleges and universities in conservative states. Despite more students being out today as trans than ever before, the majority of the more than 4,700 postsecondary institutions in the United States still provide no support to their trans students, much less to their trans staff and faculty. Moreover, with the decision by the executive branch of the federal government in 2017 to withdraw its guidance that trans students are covered
under Title IX, the colleges that have always ignored and discriminated against their trans community members no longer have an incentive to stop doing so.

**Gender-Inclusive Restroom on the Campus of the University of California, Irvine.** Some colleges have responded to advocacy by members of their trans communities by creating gender inclusive restrooms across their campuses.

## Conclusion

Much has changed about the higher education landscape since the first LGB college student group was established more than fifty years ago. Today, probably all but the most religiously conservative colleges have out LGBTQ+ students and at least one LGBTQ+ student organization. And while most LGBTQ+ students were afraid to be out back then for fear of being expelled or otherwise disciplined, many colleges today see LGBTQ+ students, as well as LGBTQ+ staff and faculty, as an asset to the institution, adding to its richness and diversity. The desire to be more inclusive of LGBTQ+ students has led a number of colleges in the last decade to add questions about sexual orientation and gender identity to their admissions forms ([Campus Pride Trans Policy Clearinghouse 2017](https://www.campuspride.org/trans-policy-clearinghouse)). Some colleges now also offer scholarships to LGBTQ+ students or to students who are engaged in LGBTQ+ activism or academic work, and some market their LGBTQ+ inclusiveness to prospective students. There is no denying that tremendous progress has been made when institutions today compete for LGBTQ+ students, rather than ignoring or excluding them.

But research indicates that LGBTQ+ students, staff, and faculty, especially trans community members, continue to encounter hostile climates on many campuses and feel that their
identities are often invalidated and marginalized by their institutions (Dugan, Kusel, and Simounet 2012; Pitcher 2018; Rankin et al. 2010). Thus, while history shows that LGBTQ+ people have relatively more positive experiences on campuses today than in the past, the present demonstrates that all colleges need to do more to make their campuses thoroughly and consistently LGBTQ+ supportive if future generations of LGBTQ+ students, staff, and faculty are to have an even better experience.

Hijras

GAYATRI REDDY
Associate Professor, Gender and Women’s Studies, Anthropology, and Global Asian Studies
University of Illinois, Chicago

A fluid term used on the Indian subcontinent to reference iconic figures of sexual and gendered difference.

The word *hijra* is a masculine Hindi/Urdu noun, with roots in the Arabic term *hjr*, meaning to “renounce,” “migrate,” or “flee.” It has many regional variants in the Indian subcontinent that sometimes map differentially on to this term: *aravani* or *thirunangai* in Tamil Nadu, *kojja* in Andhra Pradesh, *khusra* in Punjab, and *khwaja sera* in Pakistan, among many others. Historically, *hijra* has been translated as “eunuch” or “hermaphrodite,” predating itself largely on a male model of embodiment, whereby hijras are represented as sexually anomalous transvestite “men” who have renounced sex and desire, especially for women. This is most dramatically embodied in the ideal—but not always actualized—imperative to “emasculate” oneself, that is, sacrifice one's genitalia to the Hindu goddess Bedhraj Mata (or her incarnations) in return for the divine power to bless or curse with fertility or infertility, an act interpreted as a “rebirth” from male to hijra (*Cohen 1995*). But more recently, the term has been expanded beyond this binary sexual/gender schema and employed to signify both a quintessential “third gender” and membership in a global “queer” community as a native trans woman category.

This entry charts these shifts in the terrain of gender and sexual meaning signified by the term—from a more circumscribed and embodied *asli/naqli* (real/false or authentic/inauthentic) *hijra* paradigm, through its relationship with an indigenous *kothi* category and community, and more recently, to the expansion of this terrain transnationally through its instantiation as transgender. Through these mappings, one can see the fraught and labile nature of sexual and gendered meaning and practice, the politics of self-and-other labeling, and the play of trans/national social movements in marking the legibility of hijras in legal and public domains.

**Authenticity and the Gendered Hijra Body**

Although there is some evidence of a range of expressions and interpretations of gender and sexual difference in premodern India (*O’Flaherty 1980; Vanita and Kidwai 2000; Zwilling and Sweet 1996*), the interpretation of such variance remains fraught. Nevertheless, what is clear is that representations of such difference were significantly
truncated in the modern era, especially in British colonial contexts, which cast hijras as one among the several castes and tribes of India legitimately under the purview of the Criminal Tribes Act of 1871 (Arondekar 2009; Kitts 1885; Preston 1987; Thurston 1909; Russell 1916). The dominant frame at this time was grounded in a binary and reductive model of “authentic” bodily difference—whether hijras were “born” or “made,” asli (real) or naqli (false) “eunuchs”—even as authenticity did not necessarily guarantee a positive representation. This framing—through embodied alterity often mapped on to pathology—continued in much of the early postindependence literature (Sharma 1984; Vyas and Shingala 1987), with some variance in representations of hijra “perversions” (Carstairs 1956; Opler 1960; A. M. Shah 1961). It was not until 1990, when Serena Nanda’s ethnography Neither Man nor Woman was published, that this negative framing was firmly dislodged in favor of an explicit framing through gender and sexuality; hijras were represented, positively, as an “alternative gender,” with members of this community engaging in a range of asexual and sexual practices. Countenancing the view that Western binary sex/gender systems were neither innate nor universal, Nanda’s book set the stage for hijras’ instantiation as the quintessential “third gender,” a construction that inaugurated their inclusion as the authentic Indian “transgender native” in compendia of global sex/gender formations (Agrawal 1997; Arondekar 2009; Towle and Morgan 2002).

The ensuing decade—framed and prodded by popular texts like Nanda’s, as well as broader social, economic, and political changes—was a period when processes of sexual subjectification were beginning to shift and crystallize in different ways, with profound implications for hijra social and political formations. Not only did the 1990s signal the rapid spread of HIV/AIDS, but it also marked the growth of the Hindu right, with the escalation of the Ram Janmabhoomi movement that signaled the rebirth of religious politics and the establishment of the Hindu nationalist Bharatiya Janata Party (BJP) on the national front. This was also the decade that the Mandal Commission (the commission set up to redress caste discrimination in India) issued its report, where the question of “reservations” or affirmative-action policies cleaved open raw wounds in terms of caste privilege and politics and laid the foundation for battle lines regarding “minority” rights that had been building in the previous decade. Importantly, it was also a decade that saw the “liberalization” of the economy, which marked the intensification of policies exacerbating class inequalities. In short, it was a decade that brought to the fore simmering social tensions among groups differently located along hierarchies of privilege, even as it simultaneously energized the formation of social movements and underscored the need to rethink categories of the nation, “women,” and religious communities as stable or homogeneous entities, setting the stage for the political recognition of entanglements of gender and sexuality with class, religious, and caste dynamics that have continued to animate and fracture current social movements.

The “AIDS Enterprise” and the Arrival of the Kothis
One important development impacting the discursive production of hijra subjectivities/polities was its growing entanglements with the “AIDS enterprise” (Cohen 2005). Responding to the global panic about the spread of HIV/AIDS, the Indian government, with the help of international nongovernmental organizations (NGOs), began to outline the unique pathways of its transmission in India; this included a delineation of high-risk groups, such as “homosexuals.” The government was helped in this endeavor by a partial reconceptualization of the epidemiological categories through which the public health community addressed the issue. In a bid to be more “culturally sensitive”—that is, partly in response to acknowledging the existing cross-cultural variation in constructions of sexual subjectivity and the recognition that labels do not always map seamlessly to identity or behavior in contexts outside of their production—these international NGOs adopted the category of MSM, or “men who have sex with men,” to replace the earlier category “homosexual,” or gay. However, as Tom Boellstorff (2011) notes, the binarism that produced the category in the first place—namely, behavior (anal sex between men who do not necessarily identify as gay) versus identity (gay)—shifted through its deployment in the Global South, such that the behavioral category eventually became a subject position, first as a characterization of a population, an epidemiological “risk group,” and eventually—to the culturally specific members of this risk group—local MSM identities, including hijras.

As Lawrence Cohen (2005) points out, extending the need to identify local MSM identities, at least partly in pursuit of the capital tethered to AIDS work, there was a “war” raging in India in the early 1990s on how to further recognize and name gender and sexual variance. While *hijra* was one such “indigenous” category, its relationship to the MSM category remained fraught, marked as it was by multiple forms of abjection. The subsequent discursive (and material) tussle to map male-gendered sexual desire and behavior that Cohen charts in his article “The Kothi Wars” played out largely along lines of class and cultural authenticity. As he characterizes it, the “war” resembled a family feud between two giant personalities dominating the “sexual” landscape at the time: Shivananda Khan (1948–2013), a UK-born, gay-identified man, who was searching for an indigenous “South Asian” classificatory system that authentically opposed the white Euro-American “gay” label while refracting the MSM category in India; and Ashok Row Kavi (1947–), a Bombay-born-and-bred gay man with working-class roots and reputed ties to the right-wing Hindu party, who saw Khan’s attempts to discern and map such “local” knowledge as yet another neocolonial and class-specific imposition.

Ultimately, as Cohen complexly lays out, Khan won this battle, and the MSM category was refracted through the lens of gender to produce the *kothi-panthi* model (effeminate men who have sex with more masculine men, their *panthi* partners), which became the dominant frame through and by which to read “Indian” gender and sexual difference. Although this story of the “kothi wars” is obviously more complicated (compare Boyce 2007; Cohen 2005; Dutta 2013), nevertheless, by the mid-1990s, *kothis* as a term for “males who show varying degrees of femininity” was firmly lodged as one of the primary
subcategories of MSM in National AIDS Control Organisation statistics. For better or for worse, within the schemas of government and NGO recognition, kothi had emerged as an authentic South Asian variant of an MSM identity in India, with hijras as one subcategory in this broader conceptualization.

By 1995, fieldwork conducted by Gayatri Reddy (2005) with hijras in Hyderabad revealed that hijras not only used the terms kothi and panthi but, in fact, claimed they derived from hijra discourse and practice—a world where hijras asserted their occupation at the “authentic” apex of this loosely knit kothi “family,” borne through differences in religion, visibility, respect, bodily integrity, class, and sexual desire. Kothis, as an indigenous MSM family of identities, each claiming their own sexual-health organization, their individual and collective sexual rights, and AIDS capital, were here to stay, indelibly tethered to hijras in the conceptual landscape of sexual and gender variance in India. In other words, it was at least partly with the emergence of the HIV/AIDS epidemic and “anthroqueer productions” at the time, to use Paola Bacchetta’s (2002) term, that hijras were reconceptualized in this cartography as an indigenous MSM category, as metonymic figures of “sexual difference” in compendia of LGBT studies on the one hand, and as an integral part of the MSM or kothi sexual community on the other. As such, they were actively targeted by government and public health interventions in the 1990s and early in the next decade (Boyce 2007; Khanna 2009).

Shifts in the Social/Sexual Landscape: Legal Reform and the Arrival of the TGs

A decade later, the sexual landscape in India began to look slightly different. While the expression of “sexuality” in India was never “silent,” as Mary John and Janaki Nair (1998) remind us, the first decade of the twenty-first century saw an expansion of this terrain. There was a greater public visibility of nonnormative sexuality in print and visual media, as well as in art, theater, and politics, all of which fractured and questioned the normalization of heterosexuality and allowed for the emergence of new social movements, some premised explicitly on sexuality. Such movements allowed for previously marginalized individuals and groups to call for inclusion, and, like most social movements of the time, they privileged activism centering on the law.

Hijras were already beginning to publicly call for recognition early in the first decade of the twenty-first century, using their positioning ambiguously, both as sexual figures within the kothi community and as asexual figures to contest politics (the ostensible lack of sexual desire, as well as family-mediated kinship ties, ostensibly freeing hijras from potential greed and nepotism). What appears to have shifted marginally in the second half of the first decade of the twenty-first century is the seeming expansion and institutionalization of the category “transgender” (TG) in public discourse, expressly using the rights discourse and
language to stake its claim for inclusion, with hijras firmly lodged within this global category (see Hossain [2017] and Khan [2016] for similar shifts in other South Asian countries).

With the increasing transnational influence of transgender activist networks and the growing schisms within the "queer" movement, Indian transgender activists began to demand official recognition of the category “transgender” in order to garner visibility and resources, with the result that, in the first decade of the twenty-first century, transgender emerged as a funding category separate from MSM. As Aniruddha Dutta states, this institutionalization of transgender identities “forged a bifurcated schema of identification such that the government, funders, and NGOs increasingly distinguish between transgender and same-sex desiring persons not just as distinct individual identities, but also as segregated populations” (2013, 502). Importantly, at this time the transgender community, while still made up largely of hijras, was also expanding to include trans men, as well as trans women, who did not necessarily identify as hijras. Meanwhile, reductive semantic framings continued to manifest themselves, truncating the gender, embodied, and linguistic variance of the trans-feminine category, as well as playing into existing tropes of authenticity and excluding trans men from its purview—exclusions and reductive usages that linger to this day.

The second shift in this era is in the domain of the law, the horizon of most recent activism in relation to sexual rights. The legal activism that has had the most press has been the movement to repeal, or more recently, “read down” Section 377 of the Indian Penal Code (which holds that whoever has carnal intercourse against the order of nature with any man, woman, or animal commits an “unnatural” offense) and its instantiation in the Koushal v. Naz Foundation (2013) Supreme Court case, as well as the more recent efforts of the transgender movement to gain recognition as a “third gender” and access public services in the 2014 Supreme Court case National Legal Services Authority (NALSA) v. Union of India.

**Movements to Repeal or Read Down Section 377** To summarize the first development: it began in 1992 with a call by ABVA (AIDS Bhedbhav Virodhi Andolan, or AIDS Antidiscrimination Movement), a grassroots collective in Delhi, to repeal Section 377, an effort that did not get any traction at the time. A second effort, led by the Naz Foundation (a New Delhi–based NGO that works on HIV/AIDS and sexual health) early in the first decade of the twenty-first century, called for the law to be read down, decriminalizing private consensual sex between same-sex adults. This effort was supported in the Delhi High Court in 2009, when private same-sex sex was decriminalized.

On appeal by right-wing Hindu, Muslim, and Christian activists, it was re-criminalized in 2013 by the Supreme Court, which overturned the Delhi High Court decision, claiming, among other specious arguments, that the LGBT community was a “miniscule minority”
and that there were not enough arrests under Section 377 to warrant a reading down of the law. The court put the onus on the Indian Parliament; if the law was to be repealed, this was a matter for the Parliament to determine, not the courts. As scholars and activists have pointed out, the shift in the platform for action between the early 1992 ABVA call to repeal Section 377 and the more recent efforts by the Naz Foundation and others in the 2011 call to read down Section 377—the latter with a strategic focus on privacy—says as much about the state and its expansion of governance in recent times as it does about the nature of social movements and the “sexual” communities that spearheaded these efforts: namely, that they are dominated by upper-caste and class agendas (Khanna 2014; Semmalar 2014; S. P. Shah 2015).

In September 2018 India’s High Court ruled that Section 377 could no longer be used to prosecute same-sex sexual activity.

**Movements for Transgender Rights and Recognition** Interestingly, at the same time that the Supreme Court was deliberating the Section 377 case, it was also petitioned by the National Legal Services Authority (NALSA), a state-constituted body that works on behalf of marginalized groups, to support recognition for the transgender community, including hijras within this category. Four months after the Supreme Court delivered its Section 377 judgment, in April 2014, the two-judge bench of Justices K. S. Radhakrishnan and A. K. Sikri delivered a landmark ruling giving legal recognition to transgender people, allowing them to self-identify as man, woman, or transgender irrespective of their operative status. The ruling also provided a range of socioeconomic rights to members of these communities through affirmative action policies. In addition, it directed that the recommendations of the Expert Committee Report prepared by the Ministry of Social Justice and Empowerment through extensive consultation with the civil society organizations and individuals be implemented within six months. These recommendations provided the mechanism for the implementation of affirmative-action policies, among other provisions. Justices Radhakrishnan and Sikri ended their ruling by calling on the state to implement the various provisions of its ruling. As of 2018, there was still no clear process by which transgender persons can avail themselves of the right to self-identify. In those states where some of the recommendations have begun to be implemented, the process remains incomplete and is often undercut by a lack of political and economic support.

At the same time, building on the momentum of the Supreme Court judgment, in December 2014 Tiruchi Siva, a member of the South Indian political party Dravida Munnetra Kazhagam, introduced a transgender rights bill in the Rajya Sabha (India’s Upper House of Parliament). Despite pressure to withdraw the bill, Siva resisted, and, in a surprise turn of events, the bill was passed unanimously in April 2015. For reasons that remain unclear, the bill never made it to the floor of India’s Lower House, the Lok Sabha.

Instead, in December of that year, the government drafted its own bill, the Rights of
Transgender Persons (Protection of Rights) Bill 2015, apparently informed by the NALSA ruling, the 2014 bill, and consultations with members of civil society convened by the Ministry of Social Justice and Empowerment. While the new bill hewed closely to the earlier bill, it made some changes that were not progressive, such as removing the provision for transgender rights courts and national and state-level transgender welfare commissions to oversee the implementation of some of the programs. The 2015 bill slowly made its way through the labyrinth of bureaucracy and, in August 2016, it was introduced in the Lok Sabha.

To most people’s surprise, the bill that was introduced on the floor of the house was nothing like what was originally proposed, limited as that was. The bill that came up for debate in Parliament was extremely problematically worded, confusing definitions of transgender with intersex and using reductive language that drew from a binary classification (individuals are “partly male or female, a combination of male and female, or neither male or female”). The bill also removed the ability to self-identify by calling for district screening committees to “certify” transgender persons. In addition, the bill removed all provisions for affirmative action or reservations in educational institutions and employment, something that the NALSA judgment explicitly called for. As of 2018, there were protests and movements throughout the country vigorously challenging this bill and its provisions.

Caution in the Face of Progress Ultimately, whatever the outcome of these legislative and legal efforts at reform, some caution is warranted. First, the norms by which such legibility ends up consolidating and institutionalizing forms of gender and sexual variance, often delimiting the terms of inclusion and exclusion, are noteworthy. Ironically, much like the MSM and kothi labels in the previous decade, what seems to have occurred in the first two decades of the twenty-first century is a consolidation and institutionalization of the category “transgender” in state and institutional logics of development and governance, creating an overly bounded understanding of this category as well as a deepening schism between “transgender” (often or only focusing on trans women) and “homosexual” or MSM grids of intelligibility, merely generating new forms of surveillance for marking “authentic” gendered difference and delineating norms of legibility for one community against its class and sexual others.

Second, the above issue raises questions about the potential and limits of the law as the horizon of mobilization for redistributive justice. Progressive as the NALSA judgment is, ultimately, it appears to recognize community rights without providing a mechanism to redistribute power, merely expanding the reach of the state in many instances. And often, these processes of recognition make minority subjects—in this case, hijras—constantly mark their abjection and reinscribe their marginality in order to claim entitlements from the state. In a pattern reminiscent of the past, they often reify preexisting hierarchies of authenticity and low caste/class status in this process. “Progress,” it appears, is often more
circular than we would like to believe.

BIBLIOGRAPHY

This article considers the origins of scholarly practices of historicizing the sexes, the theoretical problems involved in distinguishing sex from gender across time and place, and some of the major thinkers who have advanced the field of inquiry. It also surveys several important topic areas that have been studied within the field, including the history of genital anatomical description; the history of ideas about sex differences; the history of hermaphrodites and eunuchs; the history of nonbinary, third, or many sexes (both in transcultural historical anthropology and in the history of modern sexology); and the history of recent biological thought about sexed differentiation. For much of human recorded history, sex has been determined by genital observation of infants who are then socialized as boys or girls or categorized as hermaphrodites or a third sex. Sex has also been subject to revision on the basis of genital ambiguity, castration, or comportment and sexual orientation, producing widespread patterns of counting the sexes in multiples greater than two.

Since the late twentieth century, a new Western, English-language intellectual trend emerged distinguishing sex (as biological) from gender (as social or cultural), in contrast to historical views and extant non-Western views, which have not always distinguished between these terms. These modern Western categories are now widely used to translate terms in other languages and applied to past cultures where no such distinction appears to exist. This creates a problem of potential reductionism in which past forms of ambiguity that produced notions of third or multiple sexes are now described anachronistically as forms of “gender.”

Historiography of the Sexes

The modern historical university discipline emerged in western European contexts of the nineteenth century, reflecting norms of perceiving the sexes according to the man-woman binary and of over privileging men as the primary, indeed only, subjects of history (Smith 1998). The inclusion of women as subjects of historical understanding since the 1970s introduced ideas about sex difference into the norms of historical scholarship (J. Alberti 2002). However, much of women's history and gender history, like the larger fields of
women studies or gender studies, has defined its object as "gender," reflecting the modern dichotomous view of "the sexes" as referring to biology and of "gender" as referring to cultural norms and discourses about the sexes, with a focus only on the latter (Fuss 1989).

In current transgender studies, referring to the "sexes" is generally taken to imply the reduction of individuals to the two-sex biological norm, while the term gender has been favored precisely in order to draw attention to the way in which nothing is ever automatically given by biology (Butler 1990; Halberstam 1998). In this field of study, intersex individuals are instead often considered under the banner-term of "transgender" studies, referring to all those who do not fit the man-woman binary (Stryker 2006). However, recently many intersex activists and individuals have specifically rejected this designation, as it can also be taken to imply that genital morphology is not crucial to intersex recognition (IHRA 2011; Ray 2016). However, such debates pertain to the current politics of nonbinary thinking; when considering past cultures where no distinction is made between sex and gender, historians must instead look closely at the unique categories of meaning through which historical cultures have understood differing bodies.

Use of the term gender to refer only to the behavioral aspects and social norms of the sexes emerged in English-language texts in the second half of the twentieth century (Dreger 2000). It remains difficult still to translate precisely into most other extant languages. When examining past cultures that do not have either concepts of biology or of gender, including both premodern European and most non-European cultures, it makes little sense to distinguish between "sex" and "gender" as we do in current English-language conventions. If we look only for two sexes (men and women) in history, we might overlook other sexes or account for anomalies to this binary anachronistically as transgender, transvestite, homosexual, androgynous, or ambiguous, reflecting the "general prejudice of our dimorphic classification system" (Herdt 1994, 12).

The perception of a need for more comprehensive histories of the sexes has been further stimulated by several recent cultural pressures acting upon historical inquiry.

First, there is a growing corpus of comparative anthropological evidence, relating to numerous extant cultures, of individuals who have traditionally occupied a specific social reality that is neither that of a man nor a woman. This evidence suggests the need to be more attuned to the possibility of multiple sexes in historical observation and to consider that the sexes are not generally counted according to the modern Western binary of male-female. Second, the increased visibility and legal status of transgender, queer, nonbinary, and intersex individuals in contemporary cultures has also primed more scholars in the humanities and social sciences to look beyond the man-woman binary. Finally, the growing complexification of current biological understandings of the mechanisms of sexed differentiation now permits the scientific possibility of recognizing multiple biological sexes, suggesting the sex-gender dichotomy to be less clearly distinguishable than has often
How Many Sexes in History?

Throughout history, in many different cultures, we find examples of individuals deemed to belong to a third or fourth sex, to have fused the sexes, or to exist outside of the sexes, including (but not limited to) the two-spirit people in Native American cultures, such as the Navajo, Lakota, and Athapaskan (Jacobs et al. 1997); the kathoey of Thailand (Jackson 2000); various ambiguous sexes in Borneo and Malay communities of Southeast Asia (Peletz 2009); the fa’afafine in Samoa (Bartlett and Vasey 2006); the hijras of the Indian subcontinent (Agrawal 1997); the mukhannathin of the Arabian Peninsula (Rowson 1991); hermaphrodite deities in Mesoamerican cosmoligies (Stockett 2005); hermaphrodites of ancient Greece, early modern, and nineteenth-century medical descriptions (Dreger 2000; Mak 2012); and the transformed “sworn virgins” of Albania (Young 2000). While it may be tempting to categorize each of these examples separately according to current linguistic conventions (transgender versus transsexual versus intersex versus homosexual), it has been noted by many of the scholars cited here that most cultures do not themselves refer to individuals in this way, instead categorizing all variations as third or more “sexes.”

Historical inquiry always involves a tension between the historian’s own categories of meaning and those of the past that may be fundamentally different from our own. But in reducing past sexes to modern categories, we overlook the way in which meaning was uniquely structured by past cultures.

Throughout history, we find a great variety of ways the difference between sexes is described—at times as if they are all variations on a singular model (Laqueur 1990), at times as if any variation to the man-woman binary is monstrous (Foucault 2003), at times as if women were not even fully human (Hart 1998), and at times with reference to the mutability of the sexes or their capacity to transform (King 2013). This variability suggests a powerful role for historians in elaborating the many contextualities, contingencies, and intercultural transmissions in how the sexes have been counted, differentiated, described in relation to one another, and described according to their own internal properties throughout history.

Views of Difference Based on Sexual Anatomy Understanding how Western cultures developed a strong dichotomous and binary view of the sexes has been the subject of much research among medical and sexuality historians. The 1990 work Making Sex: Body and Gender from the Greeks to Freud by Thomas Laqueur famously proposed that Western cultures, from ancient times until the late eighteenth century, only considered there to be a single sex, of which man and woman were mirror reflections: the “one-sex model,” following Galen of Pergamon (129–c. 200 CE), whose influence on both European and Islamicate medicine endured for over eighteen centuries. In this model, women’s reproductive organs were viewed as merely an inverted (and lesser) form of the more
perfect masculine structures; thus, the vagina was an inside-out penis and the ovaries were internal testicles (Laqueur 1990). With the rise of modern science from the end of the eighteenth century, there developed the idea of two radically distinct sexes grounded in the biological categories of “male” and “female.”

However, several historians have proposed that Laqueur’s characterization of ancient to early modern European ideas about men's and women's sexual anatomy may be too reductive. Elizabeth Harvey (2002) has questioned whether the one-sex model could adequately account for the array of seventeenth-century ideas that appeared to discuss both the similarities and the differences between men’s and women’s genital structures. Joan Cadden (1993) also found a much wider diversity of medical views about sex difference in medieval sources, and Fay Bound Alberti (2016) has suggested that early modern literary sources on women’s sexuality refer both to homology and to radical difference. Michael Stolberg (2003) has shown that throughout the sixteenth and seventeenth centuries, Aristotelians viewed women as imperfect men, while those following Galen emphasized the complementarity of men and women for coitus, and those following Hippocrates insisted on the radical otherness of women's bodies. By these accounts, the formation of a man-woman binary view of the sexes has been developing over a much longer period in the Western medical tradition but has never been the subject of medical consensus.

Helen King (2013) has also shown the importance of medical visions of sex transformation derived from ancient Hippocratic texts and disseminated throughout early modern Europe, such as the frequently recounted story of Phaethousa the sex-changing woman who was described as having menstruated and borne children before growing a beard and becoming a man. Such stories show that premodern European views of men and women did indeed distinguish between them but also saw them as potentially mutable. Large clitorises that resembled penises and small penises that resembled clitorises created much debate in early modern medical sources about the ubiquity of hermaphrodites and the number of possible sexes (Traub 2002). Alison Moore (2018) has shown that the one-sex model as a feminine passive mirroring of men's genital structures was only one idea present both in early modern and in twentieth-century medicine, with an alternative anatomical model throughout world history consistently drawing attention to the sexual agency of the clitoris and its likeness to the penis.

Scholars of premodern Islamicate cultures have also demonstrated the limits of Laqueur’s one-sex model when looking beyond European medical traditions. In Arabic and Persian sources, sexes have often been counted in multiples greater than either one or two, the mutability between them was often considered, and individuals of apparently indeterminate sex were documented in numerous historical contexts (Ragab 2015). The tenth-century Persian physician al-Razi (Rhazes) theorized multiple sexes on the basis of differing quantities of masculine or feminine seed contributing to the fetus (Ragab 2015).
The considerable early modern Islamicate poetic traditions focused on “beardless youths,” specifically categorized teenage and prepubescent boys as unique objects of either platonic or homoerotic desire with reference to their feminine traits. This made men’s desire for boys clearly distinguishable from the desire for other adult men, resulting in fully divided categories of meaning relating to the different forms of eroticism (El-Rouayheb 2005).

Several scholars have also shown how the sexes were understood in early modern European societies in ways that make our current assumption of a gender-sex dichotomy problematic in historical analysis. Without the modern medical concept of biological sex, comportment mattered much more for defining sex roles in premodern European cultures. In medieval France, even individuals suspected of being women but who dressed and acted like men were sometimes treated as men, and in some cases were even affirmed to be entitled to matrimony with a woman (Phillips and Reay 2011).

**Hermaphrodites and Eunuchs** Histories of hermaphrodites and of intersex people have also problematized views of the sexes in history as being only two in number, while also helping to show how Western cultures historically derived the binary view of the sexes that still predominates today. Michel Foucault’s *Abnormal* lectures at the Collège de France in the 1970s provided one of the first historical descriptions of early modern hermaphrodites, such as Herculine Barbin (1838–1868), detailing how hermaphroditism became a site of monstrosity in European medicine (Foucault 2003). From the seventeenth to nineteenth centuries in Europe, numerous doctors denied that hermaphrodites existed at all, treating individuals with both a penis and a vagina as women with enlarged clitorises, which were often excised (Park 1997).

However, in non-European contexts of the same period, there are documented cases of individuals being recognized as neither man nor woman. Juana Aguilar (Juana La Larga) was acquitted of charges of sodomy in Guatemala in 1803 following a medical inspection that confirmed Aguilar’s hermaphroditism. The court concluded that since Juana was both man and woman herself, she was not the same as either sex and therefore could not be charged with any crime as a result of her sexual acts (Few 2007). Several other major histories of hermaphrodites have documented cases of ambiguous and sex-changing individuals in early modern Iberia (Cleminson and Názquez García 2013), and in nineteenth-century France, England, and the United States (Reis 2009; Mak 2012). Medical texts in late Ming China documented examples of both hermaphroditism and of spontaneous sex-changing individuals, referring to different sexes as varying combinations of yin and yang properties (Furth 1988).

In the modern era, documented cases of reproductive-organ ambiguity have often been medically described as a form of birth defect, and large clitorises have often been excised in the belief that they indicated hermaphroditism (Rodriguez 2014). In the 1960s, infant corrective surgeries to resolve genital ambiguities and assign either a male or female sex
became ubiquitous in the United States, culminating in the Harvard protocols of John Money who proposed the term *gender* now to refer to these social dimensions of sexed identity (Downing et al. 2014). Prior to Money’s novel use of the word *gender*, it had existed in English texts from the early eighteenth century, derived from the Old French *gendre*, itself derived from the Latin *genus*. It was rarely used in any language to refer to matters of sex-difference but only to refer to kind, sort, or genre in general. The Harvard protocols assigned sex in older children according to how the child had hitherto been socialized (their “gender”), while generally favoring feminization over masculinization due to the greater surgical ease of constructing vaginal orifices than penises (Dreger 2000). The attempts to force intersex children into one of only two recognized sexes produced severe psychological and physiological trauma in many individuals. Judith Butler has described these protocols as a “violent attempt to implement the norm” (2004, 68) through the institutionalization of power.

Intersex “correction” is not the only form of genital surgery that has been aimed at altering the expression of sexual traits in individuals. Throughout several ancient and early modern civilizations, including ancient Greece, Byzantium, late Imperial Rome (Ringrose 2003; Campbell et al. 2009), in the Ottoman Empire, and the Qin and Han dynasties of China (Tsai 1996; Chiang 2018), the castration of infant boys was commonly used to create a liminal figure in the form of eunuchs. Eunuchs were first described in sixth-century BCE Greece and were last created under the Manchu emperor Pu Yi in 1910 (Chatterton and Bultitude 2008). In infant castration, the loss of the testes prior to puberty results in the total inhibition of masculine-specific traits (facial and body hair, lowered voice), creating adult individuals of noticeable androgyny. Eunuchs were created for use as royal servants and were typically considered to be either outside the sexes or to be another sex that was neither man nor woman. There was, however, much cultural variation in ideas about which of the sexes eunuchs were seen as most resembling, which does not correlate with the extent of genital surgery. In the Chinese context, where eunuchs sometimes had both penis and testicles removed, they nonetheless occupied distinctly masculine social roles as civil servants of the emperor. In ancient Greece, in Roman antiquity, and under the Ottoman Empire, where eunuchs generally retained a penis, they were more often assigned roles similar to those of women, in domestic care and in personal grooming of the elites.

**Nonbinary, Third, or Many Sexes** In the twentieth century, voluntary genital surgery in the form of sex reconstruction (or gender confirmation) has produced further possibilities for additional sexes beyond the manwoman binary. The earliest described successful surgery of this kind was that of Dora Richter, who underwent orchiectomy, penectomy, and vaginoplasty between 1922 and 1931 while working at Magnus Hirschfeld’s Institut für Sexualwissenschaft (Institute for Sexual Science) in Germany (Mancini 2010). From the 1970s, male-to-female surgeries were considerably advanced, particularly by surgeons in Thailand, which, over the last thirty years of the twentieth century, became a major provider of vaginoplasty (Chokrungvaranont et al. 2014). The first successful phalloplasty
was performed by Dr. Harold Gillies on the British physician Laurence Michael Dillon in 1946 (P. Kennedy 2007). A less complicated female-to-male surgery, that of metoidioplasty, entails separation of the clitoris from the labia minora and severing of the suspensory ligament to lower the clitoris to the normal pelvic location of a penis. Ironically, a similar surgery was originally developed in the 1920s by the Austrian gynecologist Joseph von Halban for the purpose of encouraging “vaginal orgasm” in women. It was the surgery to which the Freudian psychoanalyst Marie Bonaparte subjected herself in the attempt to cure her perceived unfeminine “clitoridism” (Cryle and Moore 2011, 232).

A number of nineteenth- and early twentieth-century sexologists, such as Edward Carpenter (1908), Hirschfeld, Havelock Ellis (Leng 2012), and Karl Heinrich Ulrichs (H. C. Kennedy 1981), considered homosexual men to be examples of a “third sex,” while others theorized that both effeminate men and masculine women were psychologically “intersexual” (Marañon 1932). The idea of individuals belonging to a third sex has often appeared in modern sexology as an explanation of same-sex desire based on the notion of its impossibility in “normally” sexed bodies. However, Ulrichs, Carpenter, and Hirschfeld also appear to have sought biological explanations for homosexual desire, based on the assumption that homosexuals would attract legal rights and greater public sympathy if they could be seen as biologically determined and, therefore, not “at fault” in relation to their desire.

The insistence then that there are only two sexes appears to be uncommon across time and place and to be particularly concentrated in modern Western cultures, where it is asserted with reference to a biological touchstone. However, this touchstone has shifted throughout the twentieth- and twenty-first-century history of biology, at times emphasizing genitalia, at times chromosomes, at time sex hormones, and at times genes (Ha 2011). The International Olympic Committee, for example, shifted its methods of demanding proof that athletes competing as women were biologically female from nude inspection in the 1960s, to testing for the XX chromosome in the 1970s, to testing for the absence of the SRY gene on chromosome seventeen in the 1990s (Rupert 2011). However, both of the latter testing methods have found individuals who, despite being chromosomally or genetically male, have female phenotypic expression of sexed traits, with or without ambiguous genitalia (Fausto-Sterling 2000). It is estimated that approximately one in one hundred births entails some level of sex-ambiguity, with one in one thousand births producing fully intersex individuals (Chase 2006). What we take to be the sex of the individual, it now seems, is merely an external impression of multiple levels of biology, including chromosomes, hormones, genital morphology, internal organs of reproduction, and external sex traits, such as facial hair, hip-waist ratio, vocal pitch, and breasts. When all these variables are taken into account, it is clear that the sexes can indeed be counted in variations greater than two (Stryker 2006).
Twenty-First-century Scientific Thought about Sexed Differentiation

In the late twentieth century, several neuroscientists presented evidence of behaviorally important differences in male and female brains due to the natural hormonal cocktails to which fetuses are exposed in utero. However, these studies have been much criticized both by other scientists and by humanistic scholars as overreaching their evidence and displaying nonscientific biases (Fausto-Sterling 2012; Jordan-Young 2010; Fine 2010). Despite the still dominant scientific view of the sexes following a male-female binary, another strand, both in cognitive affective neuroscience and in comparative biology, has recognized multiple possible sexes along a spectrum of seven variations (Panksepp 1998; Carlson 2013). Twenty-first-century studies of sex differentiation have confirmed the bipotential character of fetal sex expression, suggesting that the notion of a “default plan” as female that informed much sex-differentiation research in the twentieth century is not accurate and that specific hormonal effects are also needed to produce full female phenotype expression. By our most current understanding, then, the biological developmental default of all humans is intersex (Fausto-Sterling 2012).

Few, Martha. “‘That Monster of Nature’: Gender, Sexuality, and the Medicalization of a

In the roughly decade and a half following the first official reports of its discovery in the United States in June 1981, what would become known as HIV/AIDS became nearly ubiquitous in Western popular culture, first in news accounts in gay and lesbian and (later) mainstream media, and eventually in television, theater, art, film, advertising, and publishing. Politically, it was just as significant, prompting a new wave in queer organizing and activism, as well as the rise of the phenomenon of involuntary disclosure of minority sexualities among celebrities and political figures (commonly known as “outing”). The nexus of politics and popular culture also tended to stigmatize people with AIDS early on, to varying degrees depending on the behaviors that led to their infections: gay men, men who had sex with other men, Haitians, and intravenous drug users were considered blameworthy, while hemophiliacs and spouses of the infected were deemed innocent. Cultural visibility of HIV/AIDS began to wane in the mid-1990s, owing in part to popular fatigue, but also to the introduction of combination drug therapies that in most cases meant seropositivity no longer meant a premature death. This entry examines the history of HIV/AIDS (including its “prehistory” before the purported date of its arrival in North America) and three dozen years of its influence on Western politics and culture.

Prehistory

Looking back, the first signs of the coming epidemic and the resulting intense stigmatization of gay men arose in the 1970s, ironically partly because of the success of gay activism and the consequent recognition of the “gay community” as a quasi-ethnic group (Altman 1982, 10; Epstein 1988, 13–14). As Steven Epstein notes, the new medical discourse around gay male sexuality “asserted that male homosexual sex practices were medically problematic and therefore, by implication, gays as a group were diseased” (1988, 14). In what Michael Scarce conceptualizes as an important “harbinger of plague,” accounts of “gay bowel syndrome” began to appear in the late 1970s (Scarce 1999). A 1976 study first reported on this supposed constellation of anorectal and colon diseases diagnosed among homosexual men, including infection with what were thought to be tropical parasites (Kazal et al. 1976). Accounts of this syndrome hinged on the presumed
differentiation between the “gay bowel” and the “straight bowel” (Epstein 1988, 18); they also reinforced long-standing patterns of stigmatizing homosexual men by association with anal sex/sodomy. In addition, these accounts applied the word syndrome to gay men in ways analogous to the later naming of the acquired immunodeficiency syndrome (AIDS). Once doctors became aware of what was initially called “the gay plague” or gay-related immunodeficiency (GRID) in 1981, this codification of gay men as a quasi-ethnic group with pathological bodies reached fruition. Newspaper reports linked AIDS with “gay bowel syndrome”; in positing AIDS as the invasion of a foreign contagion, they also treated gay men and gay neighborhoods as “tropical” and, thus, outside of normal American society (Scarce 1999, 29–30).

The first cases of what would become AIDS were recognized in the United States by the Centers for Disease Control (CDC) in June 1981 after reports of unexplained opportunistic infections, particularly the previously rare skin disease Kaposi’s sarcoma and the equally rare pneumocystis carinii pneumonia (PCP), began appearing in otherwise healthy gay men in several urban areas (Centers for Disease Control 1981). It was not until 1982 that the CDC began to use the term AIDS. Investigators from the CDC surmised that AIDS was caused by an infectious agent and they suspected that it was transmitted through sex. With the consent of gay Air Canada flight attendant Gaëtan Dugas, who estimated that he had had 250 sexual partners a year from 1979 to 1981 and who named seventy-two of them, the CDC researchers were able to link forty AIDS patients by sexual contact to at least one other patient; this cluster of patients strongly suggested that an infectious agent was responsible (Auerbach et al. 1984). This infectious agent was isolated in 1983; the term human immunodeficiency virus (HIV) was officially adopted in 1986. The CDC’s 1981 study, written by David M. Auerbach and colleagues, was published in 1984 and mistakenly referred to Dugas as “Patient 0”; the authors had misinterpreted the original designator for him, “Patient O” (outside California), as “Patient 0” (zero). The study did not name Dugas, nor did it claim, as is commonly believed, that the CDC had traced the arrival of the virus in North America or the United States to him. It was subsequent media accounts, mostly surrounding the publication of Randy Shilts’s book And the Band Played On in late 1987, that “outed” Dugas as “Patient Zero” and vilified him. Shilts, a gay man himself, referred to Dugas as “the Quebeçois [sic] version of Typhoid Mary” (quoted in McKay 2014, 163). An October 1987 New York Post headline, for instance, dubbed Dugas “The Man Who Gave Us AIDS” (McKay 2014, 182). The reproduction of the Patient Zero designator in the “Patient Zero” segment of the popular CBS-TV newsmagazine 60 Minutes in 1987 also fueled the erroneous legend.

The entire Patient Zero hypothesis eventually was disproven, though its onetime widespread circulation continues to influence public perceptions of the history of the epidemic. In 2016 the journal Nature published an article showing that a reexamination of blood samples taken from Dugas “found neither biological nor historical evidence that he was the primary case in the US or for subtype B as a whole” (Worobey et al. 2016, 98).
(Subtype B was the form of the virus largely found among men who acquired HIV through same-sex activities.) Even in 1987, the hypothesis was controversial. For instance, a report in the Chicago Tribune and other newspapers in October 1987 revealed that a young man from St. Louis (identified only as "Robert R.") had died in 1969 from multiple opportunistic infections linked to HIV/AIDS and that tests of tissue samples confirmed he had been infected (Crewdson 1987). There also was evidence that he had engaged in anal intercourse, though it was not clear whether it was consensual (McMichael 2007).

HIV is closely related to the simian immunodeficiency virus (SIV), which can be dated to at least 30,000 years ago, and perhaps as long as 6 million to 10 million years ago if the assumption is correct that it dates to when the lineages of African and Asian monkeys became distinct (Sharp and Hahn 2011). Because evidence of deaths from a human variant prior to the early twentieth century has yet to be uncovered, the leading assumption among epidemiologists and other researchers has been that SIV somehow made the jump to humans in the first half of the twentieth century. The traditional conjecture was that the jump occurred either when an infected chimpanzee bit a human, or when a blood-to-blood transfer from chimpanzee to human occurred when a human was cut while preparing chimpanzee meat for eating. Edward Hooper (1999) dismissed those theories, arguing instead that the virus inadvertently was created by scientists who synthesized an oral polio vaccine using cells from an SIV-infected chimpanzee. That theory, however, failed to account for earlier reports of AIDS-like illnesses in Europeans working in Africa.

Jacques Pépin (2011) rejected Hooper's assumptions and instead focused on the possibility of an incidental transfer of SIV to a human through a bite or other bodily fluid transmission from an infected chimpanzee. Pépin argued that colonial health practices in what was the Belgian Congo (present-day Democratic Republic of the Congo), including repeated use of the same syringes on multiple patients, facilitated the rapid spread of the now human variant of SIV among humans in Central Africa. When the Belgians withdrew from the country in the 1960s and took with them most of the French-language educators who had formed the core of the country's education system, teachers from Haiti, who were black and Francophone like the Congolese, filled the breach. From there, it is assumed that HIV was transmitted to the Haitian educators, perhaps through sexual contact with local populations, and then was carried back to Haiti when the educators repatriated.

Because Haiti had a thriving sex trade, particularly with North American and French tourists, it was inevitable that HIV would follow that vector to the United States and Canada. The timing explains both the seropositive status of Robert R. and the involvement of Gaëten Dugas in the early spread of the virus, because Dugas reportedly had visited Haiti as a sex tourist. It does not, however, necessarily account for reports of sporadic AIDS-like symptoms reported in several European populations as early as the 1920s and 1930s. In addition, by the late 1990s it was known that one of the strains of HIV was found in blood samples of an African man who died in 1959 (Zhu et al. 1998). More recent research on
tissue samples taken in Kinshasa (the capital of the Belgian Congo) from 1958 to 1960 also confirmed HIV in lymph node tissue taken from a woman in 1960 (Worobey et al. 2008). These reports have led most scientists to conclude that HIV likely began spreading in humans around 1920. Recent genetic analysis using statistical approaches has indicated that from the 1920s, Kinshasa was the focus of early transmission and the source of pre-1960 viral strains (Faria et al. 2014). Railway networks are thought to have been crucial to the spread within Central Africa, reaching Brazzaville (the capital of French Congo, now the Republic of Congo) by 1937. Nino R. Faria and colleagues also found genetic evidence for pandemic expansion of HIV from 1960 and correlated this rise to public health data, providing further support for claims that the use of unsterilized needles and/or subsequent changes in the nature of commercial sex work in Kinshasa fueled the spread of the virus.

Conspiracies and Other False Leads

Perhaps not surprisingly, given the sparse information available early in the 1980s epidemic in the West, conspiracy theories and accusations that HIV was created intentionally abounded well into the twenty-first century. Among them were claims that HIV/AIDS was developed to reduce the populations of blacks, Latinos, and gay men (Carroll 2003), that the virus was surreptitiously introduced to the population through experiments on gay and bisexual men in major US cities (Cantwell 1993), and that the virus was created as a bioweapon by US government defense contractors, partly for the purpose of population control. Though some of the theories were endorsed by otherwise respected scientists, all eventually were discredited. In 2002 the US General Accounting Office (now the Government Accountability Office) responded to a request from Congress with a report that concluded there was no evidence that HIV was the result of work by National Cancer Institute’s Special Virus Cancer Program (SVCP). However, these conspiracy theories persist in the public arena. For example, in a 2014 article Nation of Islam leader Louis Farrakhan referred to AIDS as a “race targeting weapon” that will “kill only the Black and spare the White, because it is a genotype weapon that is designed for your genes, your race, for your kind” (Farrakhan 2014).

Early Coverage in the West

In the months following the CDC’s bulletin documenting the deaths of primarily young gay men in urban centers in the United States in 1981, most press accounts of the mysterious illness were found in local media, many of them specific to gay and lesbian communities. Television networks and major daily newspapers outside of New York, Los Angeles, and San Francisco by and large ignored the story until 1982. By the mid-1980s, most newspapers were publishing multiple articles addressing various angles of the HIV/AIDS story, and television and radio newscasts provided daily coverage. In his content study of Associated Press coverage from 1986, Bruce Drushel (1991) found little evidence of
sensational or homophobic language in reporters' articles, although he conceded that this did not necessarily extend to headlines, choice of angle of sourcing, or to the broader framing of stories.

However, prominent gay intellectuals in the late 1980s would have disagreed with a positive assessment of the media overall. They noted the paucity of coverage of gay men, the largest group of victims of the disease in the West, versus the more widespread coverage of heterosexuals in minimally at-risk groups, as well as the intensely homophobic reporting by many major news outlets when the crisis among men who had sex with men was covered ([Watney 1987], [1987] 1996). They also decried the lack of coverage of the slow pace of drug testing. When the more overwhelming epidemic in Africa and the Caribbean was not completely ignored in Western media outlets (itself a function of racism), racist coverage was common. Activists and scholars also complained about such biased government outreach as Britain's “AIDS: Don't Die of Ignorance” campaign (1987), which involved television and billboard advertising and a leaflet distributed to every
household in the country. Simon Watney noted, "This campaign has still found itself unable to address one single word to British gay men, who constitute almost ninety percent of people with AIDS in Britain" (1987, 73). In his pioneering queer studies essay "Is the Rectum a Grave?" Leo Bersani detailed the hostility toward homosexuality that he and many others believed the AIDS crisis had legitimated. He also framed this hostility in terms of race, in terms of its intersection with misogyny, and in terms of the gay man’s own relationship to sex, sexuality, and politics (1987).

**World AIDS Day**

A day recognizing the impact that the HIV/AIDS pandemic was having on the world’s population was first proposed by public information officers with the World Health Organization (WHO) Global Programme on AIDS (now known as UNAIDS and cosponsored by multiple United Nations [UN] agencies and programs, as well as the World Bank). The director of the program recommended the first observance be 2 December 1988. The date was chosen because it was midway between the US elections and the Christmas holiday and therefore, it was hoped, Western media would give it maximum exposure.

Each World AIDS Day since the first has had a theme. In 1988 and 1989 the themes focused on the impact of HIV on communication and on young people, respectively, largely to ease public discomfort at its association with gay and bisexual men, intravenous drug users, and Haitian immigrants. In the ensuing years, themes have included women and AIDS, community commitment, AIDS and the family, stigma and discrimination, human rights, hope, shared rights and responsibilities, leadership, and accountability. Each year’s theme now is chosen by the World AIDS Campaign’s Global Steering Committee.

World leaders promoting World AIDS Day have included Pope John Paul II (1920–2005) and Pope Benedict XVI (1927–), as well as US presidents Bill Clinton (1946–), George W. Bush (1946–), and Barack Obama (1961–). The day is one of eight official observances supported by the WHO (the other focus on general health, blood donation, immunizations, tuberculosis, tobacco use cessation, malaria, and hepatitis).

**International AIDS Conference**

Another initiative is the International AIDS Conference, which claims to be the largest conference on any global health and development issue. The first meeting was held in Atlanta in 1985, with around 2,000 scientists and researchers attending. Since 1988 it has been organized by the International AIDS Society (IAS). The conference was controversial from the beginning because of issues such as its initial refusal to allow activists to participate and its choice to convene in countries (including the United States) that at the time barred HIV-positive people from entering. The 1985 and the related 1986 meeting convened in Paris by the WHO and various French scientific and governmental bodies were
also marred by a dispute between US National Institutes of Health scientist Robert Gallo (1937–) and France’s Pasteur Institute’s virologist Luc Montagnier (1932–) over credit for the discovery and naming of the HIV virus (Bliss 2012; France 2016).

On the eve of the 1987 conference in Washington, DC—and six years after AIDS began to be a public health issue—US president Ronald Reagan (1911–2004) delivered his first-ever public comments on AIDS at a fund-raiser chaired by actress Elizabeth Taylor (1932–2011) for the newly founded American Foundation for AIDS Research (amfAR). Reagan announced mandatory HIV testing for prison inmates, immigrants seeking permanent residence in the United States, and people seeking marriage licenses (Bliss 2012). Vice President George H. W. Bush (1924–) repeated these points in a speech at the opening of the conference the next day, sparking protest and booing. Protests at the San Francisco conference in 1990 around US legislation introduced in 1987 requiring visa applicants over fourteen years old to be tested for HIV and around a rarely enforced 1950s law barring homosexuals as “sexual deviants” from entering the United States led to the 1992 meeting being moved from Boston to Amsterdam (Bliss 2012).

The 1988 conference in Stockholm marked a turning point, with greater recognition of the impact of AIDS in Africa south of the Sahara and closer cooperation with the UN. The 1994 conference was held in Yokohama, partly to raise awareness of the impact of AIDS on Asia (Bliss 2012). In 2000, in the face of the rejection by the South African government and its scientific advisory panel of the causal link between HIV and AIDS, over 5,000 scientists signed the Durban Declaration declaring that HIV is the cause of AIDS. The declaration was published in the journal Nature shortly before the International AIDS Conference in Durban, South Africa (van Rijn 2006).

The Red Ribbon

Though HIV/AIDS had captured the consciousness of much of the global population through public information campaigns, press accounts, and entertainment content, some activists still saw the need for a visual symbol that would keep awareness of the health and social crisis prominent in culture. In 1991 a group called the Visual AIDS Artists Caucus launched what it called the Red Ribbon Project, introducing a simple loop of red ribbon as what it hoped would become a universal symbol. Its first documented use at a public event occurred when actor Jeremy Irons (1948–) wore one on his jacket during the 1991 Tony Awards (Kniel and Wright 2008). The symbol soon became near ubiquitous as a celebrity fashion accessory and inspired jewelers to create elaborate pins and brooches. As Sarah E. H. Moore has observed, the cultural meanings attached to the ribbon soon exceeded the original intent: “The ribbon is, for example, both a kitsch fashion accessory as well as an emblem that expresses empathy; it is a symbol that represents awareness, yet requires no knowledge of the cause it represents; it appears to signal concern for others, but in fact prioritizes self-expression” (2008, 2). Beginning in 2007, a 28-foot red ribbon was
suspended at the north portico of the White House on 1 December every year (Phillips 2009).

The Visual AIDS Artists Caucus was not the first to employ a red ribbon in popular symbology. Five years earlier, Mothers Against Drunk Driving introduced it as a visual marker for its Tie One on for Safety holiday campaign, which was designed to encourage revelers to identify designated drivers before beginning their Thanksgiving, Christmas, or New Year’s Eve celebrations (Lee’s Summit [Missouri] Tribune 2017). Nor was the red ribbon the first use of a strip of fabric to promote awareness of a social issue. Yellow ribbons, inspired by either the popular 1970s song “Tie a Yellow Ribbon (‘Round the Old Oak Tree)” or the 1949 John Ford film She Wore a Yellow Ribbon, were used to remind Americans and the rest of the world of the hostages held at the US embassy in Tehran from 1979 to 1981. Before that, lapel pins and red poppies had been worn to commemorate Flag Day and the 1918 World War I armistice, respectively.

In the years since, colored ribbons became a popular way to visually “brand” a variety of health conditions and societal maladies, including hunger, homelessness, and various forms of cancer. Nicholas Kniel and Timothy Wright have documented twenty-four distinct ribbon colors that have been used to promote awareness of eighty-six causes (2008). Perhaps because of the proliferation of ribbons, or because of medical advances that have made HIV/AIDS more survivable and manageable, displays of red ribbons have become considerably less common since the late 1990s, replaced by wristbands embossed with the ribbon symbol or with messages about HIV testing.

**HIV/AIDS Metaphors**

As coverage of the burgeoning epidemic continued throughout the 1980s and early 1990s, metaphors that created meaning for audiences began to proliferate. According to Katherine Cummings (1993), AIDS is a metaphor “that replaces the private language of human bodies with a public language whose purpose is to explain human suffering and death” (353). The meanings attached to the metaphor have changed, even since Cummings’s observation. Author and social critic Susan Sontag, who in an earlier work had examined the metaphors that attached to cancer, pointed out that HIV/AIDS had been represented as, variously, militaristic aggression and defenses, pollution, and a judgment. At the time, she said that the metaphor by which HIV/AIDS had become best known was “the Plague,” a reference to a series of fatal rodent-borne illnesses that ravaged Europe in the fourteenth century (1989). One might well argue, however, that given both the lessened inevitability of death since the introduction of modern drug therapies and the official discourse in a number of societies that has persisted since the 1980s, a better image was invasion (i.e., a threat that comes from elsewhere—not here). As Sontag noted, HIV/AIDS was constructed from the start as coming from somewhere else, from either outside mainstream culture or from a despised adversary. Just as syphilis in the fifteenth century was known variously as the
“French pox,” “Chinese disease,” “German death,” and the “Naples sickness” (47), so was HIV/AIDS originally called the “gay cancer” and gay-related immunodeficiency syndrome. The connection to gay men has persisted in some quarters, and well into the epidemic, some authoritarian leaders continued to deny that HIV/AIDS could have had origins in their nations because, of course, none of their citizens are homosexual. As late as 1985, the leadership of the Soviet Union continued to argue that HIV/AIDS was a decadent Western disease that had yet to affect its people (Williams 1994).

Summarizing studies published in the early 1990s, Richard L. Sowell and Kenneth D. Phillips observed that the stigma associated with homosexuality has allowed cultural majorities an excuse for their failures to fully engage with the crisis (2013). In South Africa, blacks blamed whites and whites blamed blacks for bringing HIV/AIDS to the country, and some South Africans blamed Mozambique, Botswana, and Zimbabwe for its introduction (Petros et al. 2006). In addition, during his term as South African president from 1999 to 2008, Thabo Mbeki (1942–) made controversial public statements doubting the connection between infection with HIV and AIDS, leading to equally controversial policies for treating the mainly heterosexual population affected. Mbeki’s evolving rhetoric pointed to the complicity of poverty and “the West” in fueling the epidemic and condemned pharmaceutical companies for their profiteering (Sheckels 2004).

But it was Cindy Patton (1985) who arguably made the best case for an enduring HIV/AIDS metaphor—“the Bomb”—if only for its descriptive power and enduring relevance. First, just as nuclear weapons had evolved from the most devastating tool in the World War II–era Pentagon arsenal to a catalyst for global Armageddon (itself a potent and potential AIDS metaphor), HIV (as noted earlier) was thought to have evolved from a simian virus. And just as the Bomb could indiscriminately decimate entire metropolitan areas in an instant, so too had HIV/AIDS torn through neighborhoods, communities, and personal social circles, albeit in weeks and months, not seconds. Finally, just as the fear of destruction by nuclear weapons could be characterized as imminent at the end of the war, omnipresent during the Cold War, and finally (until very recently) a mere specter with the collapse of the Soviet Union, HIV/AIDS was a preoccupation and a seeming inevitability in the 1980s, a lingering concern in the 1990s, and a nearly invisible, manageable condition in the twenty-first century.

Two other sets of metaphors assumed tangible forms. One was the Names Project, conceived by longtime gay political activist Cleve Jones (1954–). The Names Project, often referred to colloquially as the “AIDS Quilt,” had its origin in a 1985 candlelight procession to honor gay San Francisco supervisor Harvey Milk and mayor George Moscone, both of whom had been assassinated in 1978. Jones encouraged marchers to carry placards on which they had written the names of friends and relatives who had died from complications from HIV/AIDS; after the march, these were taped to the facade of the San Francisco Federal Building. Inspired by the thought that the wall of placards resembled a
large patchwork quilt, over the succeeding two years, Jones and other volunteers set to
work collecting and sewing together 3-by-6-foot fabric panels representing the lives of the
deceased. The resulting quilt has been displayed on the Capitol Mall in Washington, DC,
multiple times, most recently in 2012. By 2017 it had grown to more than 48,000 panels
and weighed 56 tons.

The quilt can be thought of metaphorically in several ways. First, quilts usually are a
patchwork, comprising varied types of fabric, just as the community of HIV/AIDS casualties
represents people of different genders, ages, ethnicities, and social strata. Second, it
functions as a remembrance that survives not only those whose lives it represents, but also
those who knew the individuals, just as quilts frequently are heirlooms handed down from
generation to generation or bestowed as gifts to family members from those who made
them. Finally, quilts have a comforting function. The AIDS quilt provides warm
remembrances, if not literal warmth.

The other set is a pair of events begun on World AIDS Day, 1 December 1989. Day without
Art was intended to demonstrate the unmistakable loss to the arts community from the
deaths of artists and their supporters from AIDS-related complications. By suspending
performances of stage productions, shutting the doors of art galleries, and covering works
of art in museums and galleries that did remain open, organizers from the group Visual
AIDS hoped to underscore the cultural contributions of a small group of people by
effectively depriving society of those contributions for a brief period—in this case, one day.
That temporary and strategic deprivation was intended as a metaphor for the more
permanent and ongoing loss to society of creative people who succumbed to opportunistic
illnesses.

Similarly, in a Moment without Television, signals from thirty-one US cable/satellite
television channels went dark for 60 seconds at 8:00 eastern standard time that evening in
1989 as a metaphor for the missing contributions of writers, performers, designers, and
production crew members whose lives were cut short by HIV/AIDS. A year later, on 2
December 1990, a group of cable executives, who eventually took the name Cable Positive,
organized the event and “eschewed the blank screen in favor of shots of human eyes and
digital clocks and a voice-over that informed audiences, ‘Every eight minutes, a life is lost to
AIDS’” (Stuart 1992). Unlike Day without Art, which as of 2017 was continuing, a Moment
without Television effectively ended after its second year.

**HIV/AIDS and Media**

Such scholars as Paula Treichler (1988) and Cindy Patton (1990) have argued that
individuals also construct the meaning of HIV/AIDS through discourse, particularly in the
languages of medicine and science. Those discourses persist in the medical and scientific
communities, of course, but also among the specialized media, such as *Poz* magazine, whose
target audience is people living with HIV/AIDS (PLWHAs). But the focus of discussions also has evolved, in media targeting that community and broader ones, from protest and body counts to drug therapies and their side effects, quality of life, survivability, financial planning, and social relationships.

Following research on “gay bowel disease,” the first documented story about possible markers of what would become the HIV/AIDS crisis was published by the Advocate in April 1977. In that article, Randy Shilts (1951–1994), who later succumbed to complications of HIV/AIDS, described an alarming increase in a trio of gastrointestinal conditions—amebiasis, shigellosis, and salmonellosis—among gay-identified men in New York and San Francisco. None of the diseases was particularly rare, though their concentration among young, otherwise healthy men and their apparent transmission through sexual activity was considered unusual and a source of concern. Five years later, the Advocate published its first cover story on what was still known as GRID (McQueen 1982). In the intervening years, local publications serving the LGBTQ communities in New York, Los Angeles, and San Francisco provided coverage, including a disturbingly growing list of obituaries.

As noted above, after a slow start, the mainstream media in the West and particularly the United States were addressing the HIV/AIDS crisis by the early 1980s. Some of the first attention was on television, which covered it not only as an unfolding news story but also,
eventually, as a topic for prime-time entertainment, mostly drama, and in one-off episodes. Even so, critics accused the networks of deliberately avoiding HIV/AIDS themes in their programming because such story lines might run counter to the marketing efforts embedded in commercials that alluded to libertine behavior. In fact, it was commercial-free public television that brought viewers the most complex insights into the impact of the epidemic, in broadcasts of the award-winning film *Longtime Companion* (1989) and a documentary about the stage production *The AIDS Show: Artists Involved with Death and Survival* (1986). The film industry is notable for the sheer number of HIV/AIDS-themed works it has produced and for the longevity of its commitment to the theme. The first movies to prominently feature HIV/AIDS in their story lines were released in the mid-1980s; they included *Parting Glances* (1986) in cinemas and *As Is* (1986) and *An Early Frost* (1985) on television. At first blush, these debuts four or five years after the first reports recognized by the CDC seem to reflect belated interest in the topic, but it must be remembered that the film industry in particular has a long production schedule, typically requiring two to three years to reach exhibitors—longer if projects must run the film festival circuit to secure distribution agreements. As of 2018, more than sixty feature films with HIV-positive characters as leads had been released. Included among them are Rosa von Praunheim’s *Ein Virus kennt keine Moral* (1986; A virus knows no morals), Ryū Murakami’s *Kyoko* (1996), Pedro Almodóvar’s *Todo sobre mi madre* (1999; All about my mother), Darrell Roodt’s *Yesterday* (2004), and at least nine Bollywood films, beginning with V. P. Mohammed’s 1987 *Aids*. Robin Campillo’s *120 battements par minute* (2017; *BPM [Beats per Minute]*) chronicles the ACT UP (AIDS Coalition to Unleash Power) movement in Paris in the 1990s.

A large number of countries initiated their own media campaigns to disseminate information about ways to prevent transmission of HIV and the need to seek testing and treatment. In particular, Australia’s use of television to convey very frank messages has been credited with keeping its incidence rates low (McGregor et al. 2016). While the continent recorded its first documented case of HIV infection relatively early, in 1982, and its first death from HIV/AIDS complications a year later (Bowtell 2005), as of 2005, just 26,000 people there were thought to have the virus and just 10 percent of them were thought to be unaware of their status. Relatively early in the pandemic, in 1989, the Latino community in Los Angeles, dedicated its Día de los Muertos (Day of the Dead) celebration to the memory of those who had died from HIV/AIDS complications (“Latino Tribute” 1989). In China, where studies have shown social stigma against PLWHAs to be especially widespread (Hong et al. 2008), National Basketball Association player Yao Ming (1980–) and film star and HIV/AIDS activist Pu Cunxin (1953–) agreed to appear on posters with PLWHAs as part of the We Are Friends campaign, which planned to distribute more than 200,000 posters (Nichols 2007).

**Recent Years**
Whether because of audience fatigue or the impact of drug regimens (where they are accessible and/or tolerated by those with the virus) that have made HIV/AIDS, once a fatal condition, into what Western media represent as a manageable condition akin to diabetes, the illness has retreated into near cultural invisibility. With few new developments to report, the news media largely ignore the sheer numbers: according to the Joint United Nations Programme on HIV/AIDS (UNAIDS), as of 2017 more than 76 million people worldwide had been infected with HIV/AIDS since record keeping began in the early 1980s. Of those, 36.7 million were living with the virus and nearly 57 percent were receiving treatment (UNAIDS 2017a).

Infection rates remain high: 1.8 million new infections were reported in 2016 alone, according to UN figures. While new infection rates are down in most of the world—by 9 percent in Western Europe, western Africa, and North America; 5 percent in Latin America and the Caribbean; 13 percent in southern and eastern Asia; 4 percent in northern Africa and the Middle East; and a dramatic 29 percent in southern and eastern Africa—they are up 60 percent in eastern Europe and the countries of the former Soviet Union. In addition, 59 percent of new infections worldwide occur in people born in the late 1990s and early in the next decade—long after AIDS became less visible culturally.

**Risk Populations**

Globally, 18 percent of the newly infected are clients of sex workers and the sexual partners of other key population groups; 12 percent are gay men and men who have sex with men; 8 percent are injectable drug users; 5 percent are sex workers; and 1 percent are transgender people (although all of these percentages double when data from Africa south of the Sahara are excluded, given the low infection rates there among normally higher-risk populations). The groups with the highest HIV prevalence vary significantly from region to region and from country to country. Close to 60 percent of infections are among female sex workers in Zimbabwe, 27 percent among injectable drug users in Myanmar and Pakistan, and 20 percent or higher among gay men and other men who have sex with men in the Central African Republic (UNAIDS 2017b).

Transgender women are among the populations most heavily affected by HIV/AIDS; transgender men to date have been much less studied. According to a 2013 meta-analysis, compared to all adults of reproductive age, transgender women are forty-nine times more likely to be seropositive (Baral et al. 2013). In Bolivia’s largest city, Santa Cruz, HIV/AIDS incidence among transgender women is nearly 100 times that of the general population (UNAIDS 2014). Overall, 10 percent of the world’s transgender women are estimated to be living with HIV/AIDS. While a host of contexts associated with social stigma (e.g., interpersonal exclusion, economic vulnerability, difficulty locating employment) may be partly responsible, evidence suggests that at least in some settings, the primary cause may be the involvement of particularly young transgender women in the sex trade (Van
In El Salvador, 47 percent of transgender women reported that selling sex is their main source of income (Hivos Guatemala 2010). Sex work has been found to be significantly associated with homelessness, drug use, and perceived lack of social support (Wilson 2009).

The status of lesbians as a population at risk of HIV/AIDS is complex. Two decades into the epidemic, the CDC claimed that lesbians were a group at low risk of infection even though it was unable to verify that claim empirically (Montcalm and Myer 2000). In fact, many groups have “complicated crossover degrees of risk,” according to American feminist activist Amber Hollibaugh (quoted in Pechman 2009), and that appears to be particularly true for lesbians. Although some in both the health care and lesbian communities persist in the belief that lesbians are at very low risk for transmission, and although woman-to-woman sex is thought not to be a vector for transmission, women who identify as homosexual may have intersectional identities that place them at risk: they may be injectable drug users who share needles; their socioeconomic status may mean they have sex with men in exchange for housing and food, or to care for their children; or they may have substance addictions that affect sexual behaviors and partners. Failure to accurately account for lesbians as a percentage of seropositive women and the consequent mythos surrounding lesbians and HIV/AIDS have been blamed for their reluctance to be tested for exposure to the virus or to employ barriers to transmission during sex (i.e., dental dams) in order to minimize risk.

Some higher-risk populations are largely situational. Those in the transportation sector, particularly long-haul truck drivers, in some parts of the world have been identified as having a high incidence of HIV/AIDS. According to the International Organization for Migration, up to 56 percent of both truckers and sex workers along a major South African trucking route were seropositive (International Organization for Migration 2005). In Paraguay the majority of HIV-positive transport workers were in Asunción, in the central part of the country, and near the borders with Argentina and Brazil (Ilaria-Mayrhofer 2012). In both cases, the high incidence of HIV/AIDS was associated with prolonged waits for the loading and unloading of goods and the processing of documents.

Politics and Social Practices

Eventually, predictably, the threat posed by the persistence and pervasiveness of HIV/AIDS extended beyond the domains of health care, medicine, and popular culture to politics, commerce, and social practices. As the virus spread unchecked in the 1980s, a number of countries imposed immigration bans on persons testing positive for HIV. In response, both the UN and the WHO issued statements discouraging the practice, arguing that bans were ineffective at controlling the spread of HIV/AIDS and contravened long-standing UN policies on human rights and discrimination. Neither organization, however, approved binding declarations or treaties forbidding the practice. As a result, would-be immigrants
to countries with such bans were forced to undergo HIV antibody testing at the border, or to produce proof of negative test results (MacFarlane 2007).

Eventually, most of the world’s approximately 195 nations rescinded their entry bans, including the United States, which lifted its twenty-two-year-old ban in 2009 (Preston 2009). But according to the International AIDS Society, as of 2015, 13 countries continued to impose total entry bans on PLWHAs, 24 deported noncitizens found to be seropositive, 17 countries placed restrictions of stays of 90 days or fewer, and 58 countries placed restrictions on stays greater than 90 days. Generally, the countries with the most restrictive policies tended to be in the Middle East, although they also included Russia and Equatorial Guinea (Lemmen 2015).

The antiretroviral therapies (ARTs) introduced beginning in the mid-1990s were intended to hinder the ability of HIV to reproduce and infect. For PLWHAs who could access and afford ARTs and tolerate their side effects, and for whom they continued to be effective, HIV/AIDS became predictively survivable. Yet, ARTs are not a cure in that they do not eliminate HIV from the body once infection has occurred, and so the pharmacological quest for a vaccine to prevent infection continues.

In the meantime, studies suggest that at least one of the drug therapies proven effective at “taming” the virus might also prevent infection in HIV-negative persons exposed to the virus during unprotected sexual intercourse with a seropositive partner. In 2012 the US Food and Drug Administration approved the combination of tenofovir and emtricitabine, marketed by pharmaceutical company Gilead as Truvada, as a daily-use pre-exposure prophylaxis, or PrEP. The CDC also began recommending a short course of ARTs within seventy-two hours of potential exposure as postexposure prophylaxis, or PEP (Dominguez et al. 2016). Because of the dual roles of online social media platforms as sites for initiating social and sexual encounters and vehicles for advertising, it was perhaps inevitable that Gilead would begin advertising Truvada as PrEP on Snapchat, Tumblr, and a variety of online dating sites. Gender and cultural studies researcher Kane Race has argued that PrEP may represent a radical change in the ways HIV-negative individuals view their sexuality, leading them “to identify themselves as subject of risk in the mode of precalculation and intentionality” (Race 2016, 24).

HIV/AIDS in Africa

MANDISA MBALI
Senior Lecturer, Department of Historical Studies University of Cape Town, South Africa

The status of HIV/AIDS prevention strategies and activism in Africa as they relate to LGBTQ communities, with a particular focus on South Africa, Malawi, and Uganda.

HIV/AIDS is among Africa’s foremost public health crises, with the highest volume of cases having occurred in Southern and East Africa, from which this entry’s three country case studies (South Africa, Malawi, and Uganda) are derived. Men who have sex with men (MSM), young women (including those who are LGBTQ), and gender-nonconforming and transgender individuals are particularly vulnerable to infection on account of transphobic, homophobic, and sexist HIV/AIDS-related stigma and discrimination. Members of all these groups require, and have demanded and codesigned, accessible, empowering, and specialized HIV prevention and treatment services and policies tailored to suit their needs. Decriminalization of LGBTQ practices and criminalization of homophobic hate crimes have been key sites of HIV/AIDS-related human rights advocacy on the continent. Both public health researchers and LGBTQI advocates continue to challenge and address HIV-related homophobia, transphobia, and sexism, which remain barriers to effective HIV treatment, care, and support interventions on the continent.

MOST-AT-RISK POPULATIONS (MARPS)

Most-at-risk populations (MARPs) is a term used in global HIV and AIDS response programs to identify populations in need of surveillance for targeted prevention, treatment, care, and support interventions. The term refers to those populations at highest risk of acquiring or transmitting HIV. The risk of HIV infection increases with behaviors such as engaging in unprotected sex with multiple partners, engaging in unprotected anal sex, and sharing hypodermic needles. HIV prevalence among people who engage in these behaviors is often extremely high. They are usually the first to become infected, and their risk of being infected is higher than the general population.

The key groups usually associated with most-at-risk behavior include sex workers, clients of sex workers, injecting drug users, women who receive unprotected anal sex, and men who have sex with other men. The lists of those populations referred to as MARPs vary depending on geographical contexts and the regional or local HIV and AIDS programs. For example, long-distance truck drivers have been identified as a
critical population in the spread of HIV and therefore in need of targeted intervention. There are other terms that have been used to refer to specific most-at-risk groups, such as *most-at-risk adolescents* and *most-at-risk young people*. Other HIV and AIDS programs use the term *key populations*. There are other groups that are not ordinarily referred to as MARPs but also bear a high risk of HIV infection, such as the sexual partners of sex workers. All MARPs in relation to HIV and AIDS include people living with HIV. Terminologies describing MARPs are not unique to HIV and AIDS, as they have also been used in the surveillance of malaria and tuberculosis epidemics.

In HIV and AIDS surveillance, MARPs are not identifiable as a distinct social group. They are instead identified as proxy populations based on characteristics associated with people engaging in risky behaviors. For example, a person who engages in same-sex sex is not a risk for acquiring or transmitting HIV, but a person who engages in unprotected same-sex sex with a person infected with HIV is at risk. Behaviors that put MARPs at risk of HIV infection are usually tabooed, stigmatized, or criminalized. Individuals associated with such behaviors are driven underground, unlikely to seek HIV-related health services, and have no recourse against various human rights violations. Interventions targeting MARPs are encouraged to adopt a human rights approach aimed at averting taboos through the use of a strategic euphemism aimed at promoting human dignity.

MARPs-related terminology has opened a bottom-up approach for local communities to identify and name risky behavior. They have also been misconceived, however, as a donor conspiracy to promote tabooed identities and behavior, such as homosexuality, especially in Africa.

The terms have been widely used in HIV and AIDS education messaging to sensitize the masses on how they can protect themselves from all possible risks of HIV infection, including protection from behaviors that are taboo. Repetitive references to and usage of the terms have led to MARPs proxy populations being labeled as distinct groups. However, the Joint United Nations Programme on HIV/AIDS (UNAIDS) advises against using such terms to refer to a person to avoid individuals facing stigma from their community members (*UNAIDS 2015*).

Explanation of Terms and Concepts

AIDS in Africa has disproportionately affected the LGBTQ community since its initial identification as gay-related immunodeficiency in 1981. In diverse African socioeconomic, cultural, and political contexts, AIDS has shaped, and been shaped by, diverse erotic identities, ideas, and practices. In this context, great care must be taken to ethically and accurately define and name the lifeworlds, experiences, and representations of same-sex–practicing and gender-nonconforming individuals and groups. The approach adopted in this entry is that such individuals and groups will mostly be referred to according to their self-descriptions in the past and present. When referring to homophobic, transphobic, and sexist stereotyping or framings of such sexual and gender diversity, the first usage of such stigmatizing terms will be placed in quotation marks to indicate the author’s opposition to the deployment of such terms. References to activist and social coalitions—such as lesbian and gay, men who have sex with men (MSM), women who have sex with women (WSW), LGBT, LGBTI, and LGBTQIA++—also shift in places depending on their self-definition as expressed in each case/example offered. Finally, the term queer is used to describe “queer history” or “queer studies”: this is not to intellectually privilege the term over others but
merely to indicate that this entry engages in places with concepts and debates developed within these established and highly relevant areas of scholarship.

Similarly, the entry concentrates on three country case studies (South Africa, Malawi, and Uganda) because it aims to provide detailed sociohistorical descriptions of LGBTQ-relevant aspects of the HIV/AIDS pandemic on the continent. Such longer descriptions can both shed light on LGBTI people’s lived experiences of the disease and pandemic and illuminate the scientific rationale behind using human rights to tackle sexist, transphobic, and homophobic HIV-related stigma and discrimination. This focus on these three country case studies is certainly not aimed at understating LGBTI people’s experiences and engagements with HIV/AIDS in other African countries. With all this in mind, the entry discusses studies of HIV incidence (the number of new cases) and prevalence in other LGBTI populations in all African countries. It also discusses continent-wide advocacy projects to show the ways in which LGBTI Africans have collaboratively and creatively responded to the pandemic.

**Men Who Have Sex with Men (MSM)** The term *men who have sex with men* (MSM) is of particular importance in the history of AIDS on the continent. As in many other parts of the world, in Africa many people who have sex with people of the same sex, or who do not express dominant sex and/or gender identities, do not identify themselves as “gay,” “homosexual,” “lesbian,” “bisexual,” “transgender,” “intersex,” or “queer.” It was against this backdrop that public health scholars and practitioners created the term *MSM* in the 1990s, with the idea being that this would encourage those rejecting these labels to make use of and participate in HIV prevention and treatment programs designed to meet their needs. As of 2017, MSM remained one of the most-at-risk populations—or key populations—for HIV infection in Africa: studies indicate that they are twenty times more likely to contract the virus than the general population in several African countries. In 2015 gay men and MSM made up 6 percent of all new infections in sub-Saharan Africa (*UNAIDS 2017*). Here it must also be noted that, as with MSM, women who have sex with women (WSW) evolved as a term to identify same-sex–practicing women who do not necessarily self-describe as lesbian or bisexual.

The term *MSM*, in turn, quickly became one of self-identification for those who were uncomfortable with using conventional, Western LGBTI nomenclature. In a South African context, in particular, the term *MSM* has been used as a term of self-identification for men who wish to avoid the homophobia associated with being seen, or self-presenting, as “effeminate” or *moffies* (a derogatory South African term for gay men who are deemed to act in a more feminine fashion). In this way, AIDS profoundly shaped the self-described sexual identities of many Africans. However, although the term *MSM* has been experienced as empowering by some, it has also attracted homophobic stigma and discrimination in Africa. For instance, an unintended consequence of the introduction of the concept of MSM is that, on occasion, it has been used in a prejudicial way to cast these individuals and groups as a silent driver of the epidemic, and has been understood more in the sense of the
harm they can cause to “heterosexual” women.

MSM have also frequently wished to avoid what some of them view as being an excessive focus on their sex lives to the detriment of their wider emotional experiences and other aspects of their identities. As opposed to simplistic notions of MSM as “failing to come out of the closet,” it is important to understand their sexuality as shaped by a complex mosaic of social factors. In many instances, MSM experience culturally diverse kinds of homophobia that often articulate with multiple facets of structural inequality. Their choices not to see their sexual practices as determinate of their identities must be understood in the context of such social factors.

Studies of LGBTI HIV Prevalence in Africa

Most studies pertaining to HIV prevalence among LGBTI people in Africa have exclusively focused on MSM. The reasons for this are manifold and include the homophobic and sexist belief that lesbian women cannot get AIDS and the relative invisibility of bisexual, trans, and intersex people. While these lacunae in the literature are important to acknowledge and need to be addressed, there is, in the meantime, still merit in examining studies of MSM to obtain a picture of regional differences on the continent.

There are some important differences in HIV prevalence among MSM in the diverse regions of Africa (Southern Africa, Central Africa, West Africa, East Africa, and North Africa). In terms of general HIV epidemics, it is clear that as a subcontinent taken as a whole, sub-Saharan Africa is where most people are living with HIV and most new infections take place. By contrast, according to Joint United Nations Programme on HIV/AIDS (UNAIDS) estimates, HIV prevalence is markedly lower in North Africa considered in combination with the Middle East (known as the MENA region) compared to other regions of the continent (UNAIDS 2017). While there are 19.4 million people living with HIV in East and Southern Africa, there are only 230,000 people living with HIV in the MENA region (UNAIDS 2017). This has been linked in some existing scholarship to the fact that Islam is the dominant religion in the latter region; here, one must note that the hypothesis has been presented that HIV prevalence is lower among Muslims as a group, in general, for religious reasons.

Peter B. Gray’s 2004 survey of literature answering this hypothesis in sub-Saharan Africa found that countries within this part of Africa with higher Muslim populations had lower HIV prevalence compared to those with lower Muslim populations. In addition, this review article pointed out that research has shown that within the countries studied HIV prevalence was lower among Muslims. The same review concluded that practices of reduced alcohol consumption (which may reduce sexual engagement in behavior increasing HIV risk) and male circumcision appeared to reduce HIV transmission.
That said, the diverse countries of North Africa have different socioeconomic, political, and cultural realities, which have a bearing on HIV transmission. For instance, civil society groups and the media have documented the ways in which male rape has been used as a weapon of war and political domination by the various factions in the civil war in Libya that began in 2014 (Allegra 2017). Many of the sexual assaults that men have been subjected to in wartorn Libya have included anal rape using such objects as rockets and broom handles, and male inmates have been coerced into raping each other. Male rape in prisons is a risk factor in terms of HIV transmission. There is an almost total absence of data on the HIV/AIDS epidemic in Libya, including that relating to MSM (UNAIDS 2017). Public health studies of the quantitative impact of these war crimes on HIV transmission must be produced in order to design appropriate interventions. Overall, this anecdotal evidence suggests the importance of disaggregating HIV incidence and prevalence data both between and within countries in the region. In this regard, MSM prevalence in this region is particularly deserving of further study.

**AIDS-Related Homo- and Transphobia in Society** In order to understand homo and transphobic HIV/AIDSrelated stigma and discrimination, one must also grasp that such sexual-orientation and gender-identity-based discrimination must be viewed intersectionally and be situated in wider socioeconomic and political contexts. The concept of intersectionality was developed by African American feminists in the 1980s and 1990s to describe the ways in which multiple forms of oppression intersect with each other (Crenshaw 1991; Collins 2009). Homophobia and transphobia are intersectional in that they are enmeshed with racism, sexism, socioeconomic status, xenophobia, tribalism, ableism, and urban/rural inequalities. What this means is that some members of sexual and gender-identity minorities also occupy a lower social status than others on two or more of these additional grounds. To offer AIDS-relevant examples of this, a wealthy white South
African gay male living in an affluent urban area in a city such as Cape Town typically has more access to LGBTQ-appropriate HIV-related information (especially that delivered via the internet) and health and social services than a poor African trans woman who is an undocumented migrant and is living in a shack settlement on the outskirts of the same city.

In many instances, young, poor MSM have been confronted with HIV prevention programs emphasizing “abstinence-only” or heteronormative approaches and/or fee-based health-care services. African LGBTQI HIV/AIDS activists have addressed both types of inequality, tackling both homophobia and transphobia and lack of access to affordable medicines and health-care services. This must be understood in cultural, socioeconomic, and political contexts. In many African countries, there is intractable and rising transphobia, homophobia, and sexism as a result of the deployment of conservative ideologies in the context of extreme global and national structural inequalities. These ideologies are frequently promoted by conservative evangelical Christian and Islamist religious leaders—prejudices that are also mirrored in inflammatory rhetoric adopted by many government leaders and often written into law. Contrary to many popular depictions of the phenomena on the continent in the Global North, there is no unitary African homophobia; instead, just as there has been a myriad of diverse nonnormative gender identities and expressions of same-sex sexuality, many oppressive counter-discourses, identities, and practices have emerged and changed over time (Epprecht 2013).

These developments must also be viewed in the historical context of the colonial introduction of modern Western homophobic concepts, models, and laws onto the continent. In addition, slavery and colonialism entrenched patterns of racism, tribalism, economic exploitation, and extraction of wealth to the Global North. In postcolonial Africa, global inequality has continued to hamper democratization and democratic consolidation, whether expressed in the structural adjustment programs introduced by the World Bank and the International Monetary Fund in the 1980s and 1990s or in more recent “free trade” agreements and neoliberal conditionalities attached to aid and debt relief. The poverty and lack of access to health care that many HIV-positive LGBTI people in Africa have to endure relate to global economic injustice—something African activists have prioritized in their struggles for sexual orientation, gender identity, and gender equality.

**Criminalization of LGBTQ Practices and AIDS** The decriminalization of same-sex activities is absolutely critical in achieving three global goals: ending new HIV infections, ending the stigma and discrimination associated with the disease, and ending AIDS-related deaths through the universal provision of antiretroviral (ARV) treatment. These goals are interrelated: same-sex–practicing people will not be able to codevelop, disseminate, and access relevant information about HIV prevention without ending the stigma and discrimination; they will not feel safe in coming forward for testing or treatment; and testing is needed to access treatment, which must be taken consistently for life. Without such decriminalization, Africa’s AIDS response will remain significantly hampered, with
HIV-positive LGBTQ people disproportionately bearing the psychosocial, economic, and political burdens of preventable HIV infections and deaths.

At the level of a clinic or hospital, criminalization of same-sex practices discourages and actively blocks MSM from safely and nonjudgmentally accessing condoms and water-based lubrication, engaging in voluntary counseling and testing for HIV and sexually transmitted infections (STIs), having direct and frank discussions of their sexual activities with health professionals, consenting to anal examinations by health professionals, disclosing their HIV status, and adhering to combination ARV treatment. Similarly, lack of HIV prevention services in prisons is a key driver of new infections among MSM. Since the earliest days of the epidemic there has been clear public-health evidence of the benefits of effective, targeted HIV interventions expressly designed for MSM. The reality, however, is that African MSM who suffer under homophobic climates of silence, fear, and denial do not feel comfortable accessing appropriate services in the relatively few instances where they exist. For these reasons, UNAIDS (2014) has called for universal law reform ending the criminalization of same-sex practices and all other legislation discriminating against people based on their sexual orientation, as part of its “zero discrimination” target. Similarly, the Global Commission on HIV and the Law (2012) recommended both decriminalization of same-sex sexuality and the creation of laws to protect the rights of MSM.

Furthermore, in 2015, the International Conference on AIDS and Sexually Transmitted Infections in Africa (ICASA) was held in Harare, Zimbabwe, and, for the first time, in a declaration issued there, the ICASA called for the end of stigma and discrimination against “minorities of every type.” While the statement did not explicitly name LGBTI people as a minority, it provided scope for further advocacy for their needs to be addressed. In addition, the potential of such conferences with regard to LGBT equality advocacy was demonstrated by the fact that ICASA in 2015 published a statement from Gays and Lesbians of Zimbabwe, an LGBTI rights organization, on the ICASA website.

As of 2018, South Africa had the most comprehensive laws on sexual orientation equality on the continent. In the twenty-first century, there has, however, been some progress in African countries’ laws pertaining to the rights of same-sex–practicing people: same-sex sexual activity has become legal in Lesotho (2012), Mozambique (2015), and São Tomé and Príncipe (2012); similarly, some forms of antigay discrimination have been outlawed in Botswana (in employment in 2010, and in registration of nongovernmental organizations [NGOs] in 2016) and Mozambique (in employment in 2007) (Carroll and Mendes 2017). These significant gains were a consequence of successful African LGBTI legal activism (Carroll and Mendes 2017).

**Global Health Injustice and Access to ARVs and PrEP**

In 1996 highly active antiretroviral therapy (HAART; hereafter, combination ARV
treatment) was introduced by scientists in the United States. This treatment was revolutionary in the history of AIDS in that it could successfully suppress HIV and allow immune-system recovery in people living with the disease. Initially, this HIV treatment was available only to people living with the disease in the Global North and those who were affluent in the Global South. Since then, issues of global equity of access to ARVs have continued to be raised by AIDS activists, including those who are LGBTQ.

In particular, in East and Southern Africa as a whole, only 79 percent of people living with HIV are on ARV treatment. With regard to the three case studies, only 66 percent of people living with HIV in Malawi are on ARVs; 67 percent in Uganda; and 56 percent in South Africa (UNAIDS 2017). The barriers to ARV access across Africa include high levels of stigma (including homophobic and transphobic stigma); health systems issues, such as underfunding and suboptimal management of health systems, as well as shortages of health professionals; and the high price of ARVs (especially in relation to the newest drugs).

Similar challenges exist related to access to Truvada (an ARV) for pre-exposure prophylaxis (PrEP). PrEP involves taking Truvada daily to radically reduce the chances of acquiring HIV infection. It has been widely recognized as a breakthrough in terms of HIV prevention, especially in relation to key populations (including MSM and transgender people). However, effective provision of PrEP requires more than physicians simply giving patients the pills: ideally, they should also be tested for STIs in addition to the required regular HIV testing, and they should be provided with a safe environment in which to discuss their overall sexual health needs with their doctors. Universal provision of PrEP is, however, far from a reality across Africa. Members of the African LGBTQ community face the same barriers to access to PrEP as they do with ARVs.

In an African context of relative scarcity, gay rights activists have argued for PrEP to be provided as part of a continuum of HIV prevention and treatment services (AVAC 2016). In addition, they have pushed back against the notion of PrEP being a luxury, as opposed to a necessity, for key populations and young women (also a heavily affected social group). They have also addressed the need to explain the science around PrEP and avoid PrEP exceptionalism (the idea that the intervention exists purely for the benefit of gay men). Instead, they have made the case that PrEP should be provided to all who deem themselves to be at risk of HIV infection.

Although reliable and fast internet access in Africa is far from universal, there is extensive cell phone and social media penetration on the continent, and both types of platforms have been a key means of disseminating information on HIV among LGBTQ people. This is especially the case in relation to sharing information on PrEP, which is still a relatively new intervention. For example, African Men for Sexual Health and Rights, a Pan-African coalition of LGBT organizations for the promotion of human rights and access to quality health services, also includes information on provision of PrEP in an African context on its
website. Here it must also be noted that African LGBTQ and AIDS activists, both national and transnational, have been expanding their web presence. For example, NGOs and such community-based organizations as Sexual Minorities Uganda, the Treatment Action Campaign, and the Uganda Health and Science Press Association all have websites.

**South Africa**

It can be argued that South Africa is, in many ways, exceptional in the LGBTQ history of AIDS on the continent and, indeed, in the world. In terms of its history, the disease was quickly identified as disproportionately affecting gay men in the early period of the country’s epidemic. South African gay rights activists were among the first to conduct effective campaigning for an end to AIDS stigma and discrimination, and for a comprehensive, global approach to the prevention, care, and treatment of the disease; the latter was in alliance with gay AIDS activists in the United States.

**The Early Years of the Gay AIDS Epidemic in South Africa** The country’s first two cases of AIDS were reported in 1982, one year after AIDS was officially identified by the US Centers for Disease Control in Atlanta, Georgia, in two white gay male flight attendants. Early on, scientists in South Africa identified two clades (or strains) of the virus in the country, which they framed as largely having affected two different groups: clade B, which came from North America and Europe and mostly affected what physicians and scientists referred to as “homosexual men”; and clade C, which they characterized as predominantly having affected “heterosexual” people, and which originated in countries to the north of the continent.

From 1948 to 1994, South Africa’s National Party government adhered to apartheid policies, which aimed to keep the racial “population groups” separate, with whites as the prime beneficiaries of institutionalized discrimination against Africans, coloureds, and Indians. Racism, homophobia, transphobia, and sexism were inscribed by the socially conservative and segregationist state into law and key social institutions. Queer history in this period, including that of HIV/AIDS, was deeply influenced by the racially authoritarian state and the attending Calvinist-dominated social climate.

In this context, early government policy and media articles on the disease were vague and/or nonexistent on how gay and bisexual men could prevent HIV infection and on the care options available to those living with the disease. This created a climate of silence and fear around AIDS, not only among gay and lesbian persons but also within the wider society. In this context, it is noteworthy that, as in other countries around the world, gay and lesbian persons developed their own information, education, and psychosocial support programs and networks, including, for example, the work of GASA 6010 and the Triangle Project in Cape Town and that of the Township AIDS Project in Johannesburg.
In this period, physicians, activists, and public health specialists emphasized efforts to prevent the spread of the “gay” AIDS epidemic. There were also a few pioneering mental health professionals who called for interventions to be based on a comprehensive understanding of gay men’s psychosexual history and for their receiving adequate counseling as part of a community health–based approach to the disease (Isaacs and Miller 1985; Isaacs and McKendrick 1992). Gay organizations worked to widen same-sex practicing men’s access to condoms and to increase education about their usage and HIV testing. They also developed their own networks for the provision of care that were frequently designed according to the “buddy” system, whereby gay men cooked, visited, and provided companionship to others living with HIV and AIDS.

By contrast, there were many profound silences and gaps in knowledge and intervention around lesbian and bisexual women’s risk of HIV infection. This can also be linked to a more generalized worldwide silence about AIDS in women in biomedical and public health disciplines in the late 1980s and early 1990s. HIV infection in women was often stereotyped in medical and scientific literature as being confined to “prostitutes.” In addition, the triple (race, class, and gender) or quadruple (race, class, gender, and sexual orientation) oppression of black women affected by AIDS was often overlooked. Lesbians’ risk of infection and their HIV prevention needs would be only slightly more substantively examined and acted on by some public health agencies and scholars and LGBTI rights activists in the country following pressure from the latter at a much later stage.

Gay Rights Law Reform Campaigning and AIDS The emergence of multiracial, antiapartheid gay rights activism in the late 1980s and early 1990s proved to be pivotal in both South African queer history and the country’s political, social, and legal history more broadly. During the transition from apartheid and the early postapartheid era, activists such as Simon Tseko Nkoli, Zackie Achmat, Edwin Cameron, Bev Ditsie, and Kevin Botha successfully campaigned for the inclusion of the right to nondiscrimination on the grounds of sexual orientation in the country’s constitution. The National Coalition for Gay and Lesbian Equality and its successor, the Lesbian and Gay Equality Project, were noteworthy in using advocacy, including legal activism, to win an impressive array of reforms in the area of sexual orientation equality. This provided a basis for effective advocacy for decriminalization of “sodomy,” equality in adoption and marriage, and the outlawing of housing and employment discrimination; these activists also advanced equality in many other important areas of LGBTQ people’s lives.

In this postapartheid context, some lesbian and gay AIDS activists were able to dedicate themselves to activism to address the ongoing and intensifying AIDS crisis with special understandings of, and experiences in, policy oriented and legal activism. In this regard, a few gay AIDS activists are deserving of particular mention: Achmat, Jack Lewis, Nkoli, and Cameron. The gains these activists obtained for LGBTQ people in this period were signal in enabling effective AIDS education and advocacy: all individuals were legally free to engage
in same-sex sexual partnerships and practices, which, among other things, further enabled
the distribution of frank and gay-appropriate sex-education materials, as well as public
disclosures of being gay and HIV positive. However, many disadvantaged (e.g., black, poor,
rural, adolescent) LGBTQ individuals remained especially hindered in expressing their
sexuality and gender identities in health-optimizing ways in the context of the HIV
epidemic for two reasons: first, state support for appropriate health services for them was
extremely constrained; second, widespread societal homophobic, transphobic, and sexist
stigma and discrimination remained barriers to access to health-care services.

ZACKIE ACHMAT AND THE TREATMENT ACTION CAMPAIGN

Zackie Achmat (1962–) is an internationally recognized gay rights, AIDS, human rights,
and social justice activist. He has played a vital role in struggles for LGBTQ equality in
postapartheid South Africa. He is, however, most famous around the world for his
advocacy in the global movement for universal access to HIV treatment.

Achmat, who grew up in Cape Town, began his activism against South Africa’s system
of apartheid at the young age of fourteen and spent time in prison. As South Africa
dismantled apartheid in the 1990s, his activism expanded to lesbian and gay rights.
Alongside such activists as Simon Tseko Nkoli, he saw the need for black-led,
multiracial lesbian and gay rights organizations. South Africa’s most prominent
national gay advocacy organization in the 1980s and early 1990s, the Gay Association
of South Africa, was white-dominated and failed to view struggles for both gay rights
and an end to apartheid as linked forms of human rights activism. It was in this context
that Achmat cofounded the multiracial Association for Bisexuals, Gays, and Lesbians
(ABIGALE) in 1992. As a leader of both ABIGALE and later the National Coalition for
Gay and Lesbian Equality (NCGLE), Achmat was a critical player in the effort to
constitutionally enshrine sexual orientation equality. This advocacy resulted in South
Africa having one of the most progressive constitutions in the world in terms of LGBTQ
rights (Croucher 2002; Thoreson 2008).

Achmat linked the struggle for sexual-orientation equality with access to HIV-related
health-care services. In an August 1998 letter to members of the NCGLE, Achmat
pointed to the irony of South African gay rights activists having obtained sexual-
orientation equality yet dying in numbers from AIDS, which was by then treatable with
combination antiretrovirals (ARVs). This reality was tragically illustrated by the
November 1998 AIDS-related death of Nkoli, in whose memory the Treatment Action
Campaign (TAC) was founded that same month. Under Achmat’s leadership, the TAC
waged its struggle for universal access to HIV treatment on two fronts. Firstly, it was
opposed to then-president Thabo Mbeki’s AIDS denialism. Secondly, it campaigned
against global health injustice as expressed in international free-trade agreements and
a lack of donor funding for developing countries to provide effective HIV treatment.
In a series of public pronouncements from 1999 to 2008, Mbeki cast doubt on HIV as the cause of AIDS, HIV testing as a means to diagnose the disease, and the efficacy of ARV treatment. In response to this, the TAC designed treatment literacy programs and engaged in groundbreaking constitutional litigation. The treatment literacy programs were aimed at clarifying the science around AIDS by using locally appropriate metaphors and terms designed to address popular audiences (Hodes 2014; Robins 2008; Mbali 2013; MacGregor 2009). On the domestic front, the TAC won constitutional litigation forcing the South African government to roll out ARVs for prevention of mother-to-child-transmission. The movement, led by Achmat, then forced the government to develop an ARV program preventing millions of infants from dying from AIDS-related illnesses.

Another issue the TAC addressed was the unaffordability of ARVs due to intellectual property law and global free-trade agreements. In the early postapartheid era, forty multinational pharmaceutical companies litigated against the government of South Africa to block the passage of the Medicines and Related Substances Amendment Act, which aimed to facilitate access to generic and branded medicines imported at cheaper prices from other countries. Achmat famously smuggled generic AIDS drugs from Thailand into South Africa to highlight the dramatically inflated cost of the branded version in his country. He then became the widely celebrated international leader and spokesperson for a transnational coalition to defeat the litigation that successfully pressured the companies to drop their case. In 2003 the TAC was nominated for the Nobel Peace Prize, which demonstrated the South African movement’s global moral stature.

The TAC then stepped up its advocacy for the South African government to provide universal access to ARVs for the chronic treatment of HIV. Achmat, himself HIV positive, refused to take ARVs until the South African government made them available to all who needed them in the country, although it almost cost him his life (Tilley 2001). His drug fast inspired TAC to embark on a peaceful and successful civil disobedience campaign. On 8 August 2003 the South African cabinet ordered the Mbeki administration to begin a rollout of ARVs. The TAC’s advocacy had placed the government on an irrevocable path toward universal provision of ARVs, leading to a significant reduction in new HIV infections and AIDS-related deaths.

In 2008 Achmat passed the leadership of the TAC to a new generation of leaders, such as Nonkosi Khumalo and Vuyiseka Dubula. Subsequently, Achmat cofounded such movements as the Social Justice Coalition (for access to sanitation in informal settlements), Equal Education (for universal access to quality education and adequate school infrastructure), and Reclaim the City (for wider access to urban land). He has
also been an active participant in the Palestine solidarity movement calling for South Africans to boycott and divest from Israel.

**LGBTI Visibility in the Postapartheid Era** Despite South Africa’s progressive constitution, in the early postapartheid era LGBTI people still faced stigma, discrimination, and the denial of the existence of same-sex sexuality. Compounding this was the lack of large-scale epidemiological research showing the scale of HIV incidence and prevalence among LGBTI people. As the preceding makes clear, public health research is vital to ensuring adequate access to HIV-related health services and social services in general. This was also the case in South Africa, where the lack of crucial public health data on MSM was linked to HIV/AIDS policies that were unresponsive to the needs of MSM (*Rispel and Metcalf 2009*).

In the first years of the twenty-first century, such NGOs as OUT (in Pretoria) and the Triangle Project (in Cape Town) persistently critiqued the government’s failure to produce a national sero-prevalence survey to test the extent of HIV infection among South African
MSM. It was only as a result of persistent and focused scholarship and advocacy that further studies were produced. A signal moment in the LGBTI-led research and advocacy was a 2007 Pretoria conference on the theme of same-sex sexuality and gender that was organized by Vasu Reddy, Theo G. M. Sandfort, and Laetitia C. Rispel. This conference gave rise to an influential edited collection of essays titled *From Social Silence to Social Science: Same-Sex Sexuality, HIV and AIDS, and Gender in South Africa* (2009). Since then, the needs and experiences of LGBT youth in South African schools has been an important and emerging area of HIV-relevant research. As the map dealing with HIV prevalence among MSM indicates, studies have shown that young same-sex-practicing men are at a substantially higher risk of infection in comparison with the overall male population.

It has been shown that LGBT issues are not explicitly included in the life orientation curriculum (a compulsory high-school guidance subject) and that teachers most often either remain silent on such issues or convey homophobic and biphobic ideas in lessons (Francis 2017a, 2017b). LGBT- and HIV-relevant topics that should be covered in lessons include puberty, sexual activities and health, contraception, and relationships. An outstanding issue is that LGBT-appropriate sexual- and reproductive-health services are not available in schools. Here it must also be noted that in postapartheid South Africa, provision of condoms has, in general, proven to be a lightning rod for concerns about youth sexuality (Jewkes, Morrell, and Christofides 2009). This relates to the fallacious idea that all youths’ sexuality is “out of control” and that condom provision encourages young people to engage in sex (MacPhail and Campbell 2001).

Institutionalized homophobia in schools, in turn, renders such young people vulnerable to ill health caused by HIV and STI infection, drug and alcohol abuse, eating disorders, depression, and anxiety (Meyer 2003; Richardson 2009). It is, however, important not to overlook the agency and resilience of LGBT young people in school settings: this could be capitalized on to develop empowering curricula and school environments to entrench and promote their human rights both within schools and more generally in the wider society (Francis 2017a, 2017b).

In June 2017 Steve Letsike, the chairperson of the South African National AIDS Council, announced that it had launched its first LGBTI HIV plan in Durban. In 2006 it was revealed that there was no LGBTI sector representation in the body, and the 2017 development needs to be seen as an outcome of focused advocacy by civil society organizations and activists. The program is part of the country’s 2017 National Strategic Plan on HIV, tuberculosis, and STIs, and includes bold targets around health, empowerment, psychosocial support, human rights, and evaluation.
The eleven-year time lag between the identification of the need for LGBTI sector representation on the South African National AIDS Council and the inclusion of a program in the national strategic plan addressing their needs in relation to HIV is noteworthy. It points to the wider social reality that, even following the country’s outlawing of sexual orientation and gender discrimination in its postapartheid constitution of 1996, LGBTI activists have still had to engage in policy advocacy to see its implementation by the state. This has even been the case in relation to HIV—a severe national health crisis—which has disproportionally affected LGBTI people.

This policy has, however, been criticized as inadequate in addressing the needs of trans men. In 2017 the Center of Excellence for Transgender Health (at the University of California, San Francisco) demonstrated that testosterone hormone therapy causes the thinning of the vaginal wall and vaginal dryness and inflammation in trans men who have not undergone surgery. In turn, these clinical outcomes heighten their risk of contracting HIV. Again, the limited data on HIV incidence in this group has hampered the development of appropriate HIV prevention policies and programs addressing their needs.

In the postapartheid era as a whole, stigma and discrimination have, however, remained significant barriers to LGBTI people’s access to services, especially if they are black and live in townships. Many LGBTQ people have hidden their gender and sexual-orientation identities, same-sex exchanges, and relationships so as to prevent becoming vulnerable to public exposure and ostracism. These social realities have affected their ability to adopt HIV prevention measures and to access HIV treatment.

Lesbians' and Women's AIDS Activism As discussed above, LGBT AIDS-related issues need to be viewed through an intersectional lens. This certainly applies to analyzing the experiences of lesbian and bisexual women and WSW. An overarching theme in relation to same-sex–practicing women is their struggle for recognition of the factors that enhance their risk of contracting HIV. They have, therefore, undertaken research and pressed for the development of government policies and programs to address their needs.

In the 1980s AIDS was identified by public health specialists and physicians as primarily affecting gay men. Here it is important to also mention that the gaps and silences in relation to HIV in same-sex–practicing women must be linked to generalized patriarchy in medicine. This lack of research has, in turn, shaped, and been shaped by, the dangerous sexist and homophobic myth that lesbians are at no risk of HIV infection. Lesbian AIDS activists and scholars have instead argued for women who have had sex with women to gain and spread in-depth understandings of the relevant HIV risk factors involved in each sexual practice in which they have engaged, many of which are of limited risk, but some of which do significantly render them vulnerable to infection.

In addition to severely hampering lesbian women's adoption of HIV prevention techniques,
this myth also drove sexist and homophobic health-worker discrimination in access to—and in some instances denial of—HIV-related health services. LGBT organizations have been at the forefront of developing community-based surveys of HIV prevalence, and this has also informed advocacy for LGBT-focused and LGBT-led policies and programs to address the disease. Importantly, in terms of addressing the “lesbians no-risk” myth, this research-driven activism has also focused on the interests and needs of lesbian and bisexual women and WSW.

Such activists as Vicci Tallis, Nonhlanhla Mkhize, and Zanele Muholi have been at the forefront of the development of HIV campaigns, the dissemination of information in various media, and participation in community-based research around these issues. A 2012 epidemiological study showed that the only independent predictor of lesbian women being HIV positive was their having been subjected to nonconsensual sex perpetrated by either men or women, or both men and women (Sandfort et al. 2012). It must also be noted that the same study found that HIV-positive lesbians, WSW, and bisexual women were more likely to have engaged in transactional sex with men and women (Sandfort et al. 2012). Furthermore, it needs be acknowledged that homophobic hate crimes, especially “corrective rape” against black lesbians, have rendered them at risk of HIV infection. Corrective rape refers to males sexually assaulting lesbians under the homophobic assumption that it will render them heterosexual (Mkhize et al. 2010). The same study found that lesbian women were less likely to go for an HIV test. Similarly, research conducted by Ruth Morgan and Saskia E. Wieringa found that, despite widespread awareness of HIV and AIDS, few were practicing safe sex, apart from those living with HIV (2006). They found that lesbian women’s frequent denial of HIV risk was often rooted in their belief in the faithfulness of their partners, even when they knew that their partners had had sex with men.
As Tallis has argued, since the 1980s, lesbian AIDS activists have promoted the idea that “low risk is not no risk” (2009, 222). She has also pointed to the limited availability of devices to promote both penetrative and nonpenetrative safer sex, such as dental dams, finger cots, and female condoms. Lesbian AIDS activists have called for the diverse, lived realities of lesbians—the rich array of their identities, relationships, and experiences—to be used to develop HIV programs addressing their needs and interests.

**South African HIV Treatment and Global Health Activism** Gay and LGBTQ activists such as Achmat were absolutely critical in showing leadership in the postapartheid-era development of the TAC, an innovative and influential social movement that argued for universal access to HIV treatment in South Africa. The TAC’s development must be understood as having been facilitated by the success of legal activism in the area of sexual orientation equality (Mbali 2013). The TAC’s activism used antiapartheid rhetoric, treatment literacy, and the socioeconomic right to health care to argue for universal access to ARVs for the prevention of mother-to-child transmission and the chronic treatment of
HIV. This intersecting of gay rights and AIDS activism shows that LGBTI advocacy in postapartheid South Africa has not been merely confined to “identity politics,” or merely to addressing the concerns of privileged, white, cisgendered (referring to those whose gender identity matches their assigned gender at birth) males, but that it has also directly tackled the HIV-related social injustices experienced by all poor and marginalized people affected by the disease. Furthermore, such HIV treatment activism has affected the politics of global health in relation to the disease at an international level.

Under Achmat’s leadership, the TAC successfully campaigned for universal access to ARVs based on three sets of demands: an end to the pseudoscientific policies guided by the South African president Mbeki’s AIDS obfuscation; reduced medicine prices via increased access to generics and the alteration of international free-trade agreements to facilitate this; and the provision of adequate foreign aid from donor countries to roll out ARVs (Mbali 2013). In terms of Mbeki’s AIDS denialism, from 1999 to 2003 he made bizarre statements in support of AIDS dissidence in relation to the diagnostic reliability of HIV tests, HIV as the viral cause of AIDS, and the safety and efficacy of ARVs used for the prevention and treatment of the virus. Even after he had largely stopped his strange pronouncements on the disease and epidemic, AIDS denialism continued to inform health policy on the issue, especially under the aegis of Manto Tshabalala-Msimang, his minister of health (Geffen 2010). In 2006 she infamously recommended HIV treatment consisting of a diet of lemons, beets, garlic, and African potatoes instead of combination ARV. The South African government was subjected to international ridicule when these vegetables were placed on display as HIV treatments at the International AIDS Conference held that year in Toronto. The TAC combated this through carefully designed HIV treatment literacy programs where the science of HIV and ARVs were explained to its membership, members of the public, and journalists.

At the international level, the TAC and its allies in the Health Global Access Project, the Consumer Project on Technology, and Médecins Sans Frontières (also known as Doctors without Borders) successfully pressured over forty multinational corporations to drop a court case trying to block the administration of South African president Nelson Mandela from passing a law enabling wider access to affordable and generic medicines. Finally, their advocacy also played a role in catalyzing substantial increases in foreign aid to provide wider access to ARVs, as evidenced in the creation of the Global Fund to Fight AIDS, Tuberculosis, and Malaria and the President’s Emergency Plan for AIDS Relief, a US governmental initiative.

Emerging HIV-Related Trans and Intersex Issues In this section, it is necessary to first note that individuals who are trans, gender nonbinary, or intersex have different sexual orientations, so it is only in some instances that their identities, interests, and needs will overlap with those of same-sex–practicing people. With this reality in mind, it can be noted that, as of 2017, research and advocacy with regard to gender identity equality in relation
to HIV in South Africa remained relatively new and dynamic. This is reflected in the fact that governmental efforts to develop policies and programs to address the HIV-related needs of trans people are still extremely new. This can be attributed to two sets of issues.

First, it can be argued that organizationally based, policy-oriented civil society trans activism emerged only in the first years of the twenty-first century. In terms of legal activism, trans and intersex activists, such as Simone Heradien and Estian Smit (Morgan, Marais, and Wellbeloved 2009) of the transgender support group of the Triangle Project (which later became the independent Cape Town Transsexual/Transgender Support Group), are worthy of special mention. Their law reform advocacy was particularly effective in pushing for the passage of the Alteration of Sex Description and Sex Status Act of 2003.

Second, in terms of research and policy making, HIV policies to address the needs of trans and intersex persons were only just formulated as of 2017. A vital issue here is a denial of the interests, visibility, agency, and voice of trans people in HIV-related health services, academia, policy making, and activism. A key example of this is an HIV-positive trans woman who was denied access to sexual realignment surgery at a public-sector health facility on account of her living with the disease. AIDS-related civil society activists have, on occasion, provided vital social support to trans individuals. An instance of this is Charlie, who reported that a social worker from the TAC assisted her in explaining her sexual orientation to her mother (Morgan, Marais, and Wellbeloved 2009).

Malawi

This small Southern and Central African country is also heavily affected by HIV/AIDS, with a significant proportion of the people living with HIV being MSM. In contrast to South Africa, MSM in Malawi face legalized and institutionalized homophobia that severely hampers the country’s response to HIV/AIDS. The extent of the problem is indicated by a study showing that 21.6 percent of MSM in Blantyre and Lilongwe are living with HIV (Baral et al. 2009); by comparison, 9.6 percent of all males over the age of fifteen are living with HIV (UNAIDS 2017).

History of “Homosexual” AIDS in Malawi Malawi is a low-income, developing country with both a significant generalized HIV epidemic and an MSM population that has a higher rate of HIV prevalence than that of the overall population. The criminalization of same-sex sexual activity, stigma, and the existence of only limited MSM-focused community-based HIV prevention interventions all serve to hinder the reduction of new HIV infections and AIDS-related deaths among this population.

In terms of the epidemic's history in Malawi, the country's miners were identified as among the early cases of AIDS in mid-1980s South Africa. Like many other Southern African
countries, Malawi was a major source of male migrant labor for South Africa's mines. At the time, epidemiologists and physicians typically presented AIDS in African males as "heterosexual" in character. This typology rested on gaps and silences about Africans' same-sex sexuality in South Africa at the time.

It is extremely important to situate homophobic AIDS-related stigma and discrimination in Malawi in the context of the history of same-sex male sexuality and homophobia in the country in general. It has been well documented by historians that men living together in single-sex hostels near the South African mines from the late nineteenth century onward often engaged in sex with other men (van Onselen 1982; Harries 1994; Epprecht 2014). Historians have also documented that "mine marriages" (inkotshane), while situationally shaped, were also often mutually erotic in that they involved desire on the part of each member of the couple. Contrary to common contemporary claims that homosexuality is "un-Malawian," the criminalization of male same-sex sexuality (especially sodomy) occurred with the British imposition of their criminal law to Nyasaland (present-day Malawi) during the colonial period.

When AIDS emerged in Malawi in 1985, Hastings Kamuzu Banda, the country's president at the time, did not want to draw public attention to the epidemic owing to his reticence to spark an uptick in public discussions of sexuality. Despite growing governmental efforts to engage in public AIDS awareness campaigns in the first decade of the twenty-first century, more rigorous AIDS interventions were introduced only with the influx of foreign aid to widen access to antiretroviral drugs. In the context of the ongoing criminalization of homosexuality, these growing policy interventions have continued to fail to adequately, explicitly, and appropriately address the HIV-related needs of LGBTQ Malawians (Mwakasungula 2013).
Tiwonge Chimbalanga (at Back) with a Gender Dynamix Outreach Officer in Cape Town, South Africa, 2012. Chimbalanga, a trans woman from Malawi, was convicted of sodomy and indecency in her native Malawi after authorities learned of her engagement ceremony to another man. Under international pressure, she received a presidential pardon, after which she moved to the relatively more tolerant environment of South Africa. Her case is just one example of the social stigma and legal persecution endured by Malawi’s LGBTQ population, which results in fewer members of that population seeking HIV prevention or treatment options.

The Impact of the Criminalization of Same-Sex Activities Sections 153 and 156 of the Malawian penal code criminalize same-sex practices. More precisely, Section 153 makes it illegal for any person to have “carnal knowledge of any other person against the order of nature,” including sodomy, and Section 156 deals with “public decency” and enables the punishment of “homosexual acts” with imprisonment and corporal punishment (Price 2010). Civil society campaigns against these unjust laws have been led by such figures as the human rights activist Daveson Nyadani of the Centre for the Development of People, a community-based NGO that addresses minority groups’ needs in the context of health and development. Nyadani (2009) has argued that Malawi’s penal code mirrors sociocultural stigmas around same-sex intimacy. Furthermore, he has pointed to the possibility of interpreting the Malawian constitution’s chapter on human rights in a way that could include the outlawing of sexual orientation discrimination. The constitution prohibits discrimination on the “grounds of race, colour, sex, language, religion, political or other opinion, nationality, ethnic or social origin, disability, property, birth, or other status”; using this section, Nyadani (2009) has argued that sexual orientation could be deemed to fall under the umbrella of “other status.” In terms of repealing this piece of legislation, legal
scholars have, moreover, pointed to the relevance of other sections of the constitution dealing with equality, dignity, and informed consent for participation in medical and scientific experimentation and personal privacy (Price 2010). Furthermore, the African Charter on Human and Peoples' Rights has been interpreted by the African Commission on Human and Peoples' Rights as ensuring equal treatment “irrespective” of sexual orientation (Price 2010).

However, such human rights defenders’ demands for reform of the country’s penal code have yet to be met, with parliament having failed to adopt proposals to amend the code on several occasions. Donor governments, in their provision of foreign aid to address AIDS, have largely provided almost no direct input on law reform. An example of this is the 2012 declaration by Malawian president Joyce Banda that there would be a moratorium on arrests of people for violating the country’s antigay laws pending debate on their legislative repeal (Mapondera and Smith 2012). As of mid-2018, there had been no further progress in actually repealing the laws themselves.

**MSM Debates** In Malawi, the category of MSM has provided both public health researchers and human rights activists with a vehicle for researching, documenting, and advocating for recognition of the extent of HIV infection among same-sex–practicing men. Yet, this still relatively marginal increase in recognition of the scope of HIV infection among MSM has generally not resulted in adequate government provision of appropriate and empowering health and social services for such individuals.

Queer studies by such academics as Marc Epprecht (2013) have argued that African LGBTQ and human rights advocates have strategically used discourses of MSM and AIDS to promote broader rights for sexual minorities. It is, however, important not to overstate the impact of this approach in challenging homophobia in government or society more broadly. For instance, in 2009 Mary Shawa, then serving as the Malawian secretary for nutrition, HIV, and AIDS, argued that MSM who had not “come out” threatened the country’s population. Similarly, despite the mention of MSM in the country’s national AIDS strategic plan since 2003, NGOs promoting their rights and interests in relation to the epidemic had, as late as 2011, still not been allocated funds by the National AIDS Commission.

It is impossible to understand the disproportionate effect of HIV/AIDS epidemics on MSM without examining the broader societal and governmental homophobia in the country. A key idea behind this stigma and discrimination is that to be gay, bisexual, transgender, or MSM, or to engage in same-sex sexual practices, is outside, or “alien to,” a timeless, unchanging “Malawian culture.” A particularly high-profile 2010 case involved the arrest and prosecution of an anatomically male couple (Steven Monjeza and Tiwonge Chimbalanga), one of whom self-identified as a woman, for arranging and participating in a traditional engagement ceremony. The couple was convicted of sodomy and indecency and sentenced to fourteen years’ hard labor. Although Bingu wa Mutharika, the Malawian
president at the time, pardoned them shortly thereafter, following intense international diplomatic pressure, the case has remained important in animating debates in Malawi about the promotion of sexual orientation equality in foreign aid and in society more generally. The extent to which homophobic discrimination can influence MSM's ability to self-identify as such is indicated by the fact that Monjeza later left Chimbalanga, denied he was gay, and married a woman (Face of Malawi 2012). His relationship with his wife was short-lived; he turned to a life of theft, was imprisoned, and later died of unknown causes.

Public health research has shown that, in contexts where MSM are regularly physically abused, sexually assaulted, and blackmailed, they experience challenges in discussing their gender identity, sexuality, and sexual history with health professionals, even on a "confidential" basis. This prevents them from accessing appropriate male condoms and lubrication, HIV testing, and access to PrEP (although the latter is seldom available because of wider LGBTQ, AIDS, and global health injustices). Furthermore, when pointing out the scope of the issue and appropriate policy and programmatic responses, human rights and LGBTQ activists also face charges that there are "no gays" in Malawi. Policy makers, health professionals, and civil society have frequently been silent on and resistant to addressing issues of homophobic and transphobic HIV-related stigma and discrimination, as well as on pointing out or the need for further research and interventions in relation to these phenomena.

It is in this context that community-based services have been provided by NGOs in Lilongwe and Blantyre focusing on the provision of condoms, lubrication, and risk-reduction counseling (Beyrer et al. 2011). Owing to LGBTQ individuals' disproportionate vulnerability to HIV infection, there have been pilot intervention projects collaboratively run by researchers and LGBTQ and human rights activists. In particular, researchers based at the Johns Hopkins University Center for Public Health and Human Rights collaborated with the Centre for the Development of People to promote the adoption of appropriate prevention methods (Wirtz et al. 2013). However, such projects have shed further light on the need for decriminalization of same-sex sexuality to be viewed as an urgent public health priority in order to maximize Malawian MSM's access to HIV prevention services (Wirtz et al. 2013).

**Uganda**

AIDS became recognized as a crisis in Uganda in the 1980s, when the country was ruled by President Yoweri Museveni, a military leader who had emerged victorious from a civil war in that country. It is widely recognized that the social mobilization catalyzed by both his administration and civil society organizations such as the AIDS Support Organisation did lead to a reduction in HIV infections in the country in the 1980s and 1990s. The approaches of “Abstain,” “Be faithful,” and “use Condoms” (ABC) in relationships were heavily promoted. Moreover, the metaphor of “zero grazing” was successfully deployed by
Museveni and his administration in order to encourage a reduction in the number of partners in ways that disrupted the sexual networks driving HIV incidence in Uganda (*Thornton 2008*).

However, the Ugandan government’s track record in addressing the HIV-related needs of MSM has been severely marred by state-entrenched legal, social, and political discrimination. This has had severe health implications for MSM in Uganda. A study conducted in Kampala found that 13.7 percent of MSM overall were living with HIV, with MSM over age twenty-five having a higher infection rate of 22.4 percent (*Hladik et al. 2012*). A particularly significant finding was that men over age twenty-five and those who reported homophobic abuse were significantly more likely to be living with HIV.

In common with such other East African nations as Tanzania, Kenya, Malawi, and Zambia, in Uganda it is illegal to have “carnal knowledge of any person against the order of nature.” Moreover, it is not allowed for any person to permit another male person to have such “carnal knowledge” of another male, making even those who are simply aware of others’ same-sex sexual activity subject to prosecution. In addition to causing stigma and discrimination that prevents same-sex–practicing people from accessing services, this law has blocked research on HIV in this population. For example, a police raid of a US-funded Walter Reed HIV research and treatment center at Makerere University was based on fallacious claims that it was causing people to become homosexual (*Hagopian et al. 2017*).

**The Impact of the Criminalization of Same-Sex Activities** As noted above, the criminalization of same-sex sexuality increases HIV incidence and deaths. The introduction of the Anti-Homosexuality Bill in the Ugandan parliament in 2009 represented an important moment in the history of the criminalization of same-sex sexuality in Uganda: this bill allowed for life imprisonment as punishment for gay sex. It also included the offenses of “aggravated” cases, among which were cases in which a person living with HIV had engaged in gay sex. In addition to the imposition of life imprisonment as punishment for “offenders,” the bill mandated that those in all categories be forced to undergo HIV tests.

Alongside fifteen other low-income countries, Uganda received funding from the President’s Emergency Plan for AIDS Relief legislation promulgated by the administration of US president George W. Bush in 2003. Uganda’s ABC model was noted in the legislation as having successfully prevented HIV infections in the country; however, both this and later models under the administration of US president Barack Obama have been critiqued as not having effectively addressed the issue of criminalization of homosexual activity (*Hagopian et al. 2017*). It must be noted, however, that, Museveni’s signing of this bill into law in 2014 occasioned a US government spokesperson to announce a decision to suspend aid to the country; yet, this decision was not announced on US government websites, indicating a lack of policy commitment on the part of this donor nation to implement such a decision.
As in other African countries, the criminalization of same-sex sexuality has been promoted and heavily funded by the US Christian right. The US Christian right has been influential in Museveni’s Uganda since 1986; however, Museveni began to vocally criticize same-sex sexuality only in the late 1990s. In this context of religiously inspired, state-promoted homophobia, the 2011 murder of the gay rights activist David Kato marked an especially low ebb in terms of the promotion and protection of human rights in the country. Kato, a co-founder of Sexual Minorities Uganda (SMUG), was murdered after the Ugandan newspaper *Rolling Stone* published an article purporting to reveal “homosexuals” and calling for them to be hanged (Gettleman 2011). Kato’s admitted killer claimed that he had committed the crime in response to sexual advances from Kato (BBC 2011).

The history of activism for sexual orientation and gender identity equality in Africa is not, however, purely one of enforced passivity, silence, and defeat on the part of LGBTQ people. It is important to recognize that organizations such as SMUG and the Uganda Health and Science Press Association (UHSPA) adopted consistent and internationally effective opposition to the Anti-Homosexuality Bill and other forms of legislative and social discrimination. Although Museveni signed the Anti-Homosexuality Bill into law in February 2014 following its earlier passage by the Ugandan parliament, activists, journalists, and academics launched a successful bid against the act in the nation’s constitutional court. In particular, in August 2014, the court struck down the law on the grounds that it had been passed without the constitutionally mandated quorum in parliament. Subsequently, the attorney general announced that he had no plans to appeal the ruling, possibly owing to pressure from Museveni, who wished to avoid further ruining international relations with donor countries.

**MSM Debates** As has been shown above, LGBTQ and human rights advocates in Southern and East Africa have been strategic in their deployment of the concept of MSM in relation to AIDS to push for sexual orientation equality in general. For instance, the UHSPA, a self-identified LGBTI organization created in 2006, offered a public health and human rights critique of the government’s proposal to render HIV transmission a form of “aggravated homosexuality.” In particular, the UHSPA argued that it would also lead to MSM avoiding HIV testing and disclosure on account of fear of prosecution (UHSPA 2010).

HIV/AIDS remains one of Africa’s most pressing public health problems today, with the largest number of cases having been concentrated in Southern and East Africa. This entry has, therefore, focused on three country case studies in these regions—namely, South Africa, Malawi, and Uganda. These examples can be used to magnify sociohistorical aspects of the ways in which HIV/AIDS has both shaped the lifeworlds of LGBTI people and been a site of activist demands for recognition of the voice and visibility of advocates for sexual orientation and gender equality.

LGBTQ people are a key population in the HIV epidemic whose rights and needs must be
addressed in order for the epidemic to be brought under control and, ultimately, ended. In particular, MSM, young women (including those who are LBTQ), and gender-nonconforming and transgender individuals experience transphobic, homophobic, and sexist stigma and discrimination that must be comprehensively eliminated in order to effectively tackle HIV on the continent.

LGBTQ activists have challenged their invisibility and stereotyping in relation to HIV-related research, policy, and practice. As opposed to being helpless victims of such invidious social attitudes and discrimination, members of these groups in Africa have been active in advocacy for and codesign of effective, equitable, accessible, and human rights–based HIV prevention and treatment services and policies. In concert with public health researchers, journalists, and other human rights NGOs, they have demanded and continue to demand the decriminalization of LGBTQ identities, NGOs, and practices, as well as the criminalization of trans- and homophobic hate crimes in the context of the continent’s pandemic. They also continue to highlight important remaining gaps in relation to future research on prevention and treatment in LGBTQ people in Africa, especially that dealing with transgender people, LGBTQ people in North Africa, and WSW. In addition, their ongoing role in challenging national and global health injustices in relation to access to ARVs for PrEP and the chronic treatment of HIV has been pivotal in expanding access to medical innovations for the world’s poor as a whole. Most importantly, their activist responses to HIV-related stigma, discrimination, and social injustices are important examples of the influence LGBTQ advocates have had and can have in advancing human rights and development for all.

HIV/AIDS in Egyptian Cinema

HEND F. ALAWADHI
Assistant Professor, College of Architecture
Kuwait University

The various ways in which Egyptian film has dealt with the topic of HIV/AIDS and how these reflect Middle Eastern cultural views of the disease.

According to a report issued by the Joint United Nations Programme on HIV/AIDS (UNAIDS) in 2017, an estimated 11,000 Egyptians over fifteen years of age had HIV in 2016, yet only 6,500 people (approximately 59%) knew their HIV status. The report also estimates that approximately 230,000 people (with a possible range of 160,000 to 380,000) are living with HIV in the Middle East and North Africa.

At the outset of the AIDS epidemic in the 1980s, homosexuality was perhaps the strongest of the many associations attached to HIV/AIDS, especially in the United States and the United Kingdom (Watney 1996; Treichler 1999; Crimp 2002). In the United States, AIDS was incorrectly and publicly attacked as a gay disease, and it was initially dubbed gay-related immunodeficiency (Treichler 1999). Many scholars have written at length about the implications of HIV/AIDS and homophobia, and how they affected the lives of thousands of gay men—in addition to other marginalized groups whose exposure to HIV meant that they were suddenly subject to homophobia as well. It is perhaps the Western influence on the Middle East that has solidified the idea of HIV/AIDS as a homosexual illness. Citing the Palestinian American scholar Edward W. Said (1935–2003), Paula A. Treichler explains how the “Third World” media—and consequently the media in the Arab world—often perpetuates information (whether misleading or not) from “First World” sources and becomes, symbiotically, a source of information for First World countries about the Third World, and for Third World countries about themselves:

As Edward Said argues, modern representation in the decolonized world depends increasingly on a concentration of media power in metropolitan centers; this contributes to the monolithic nature of Third World representations, which are in turn a major source of information about Third World populations not only for the “outside world” but also for those populations themselves.

(1999, 109)
As reductive as Treichler’s argument may sound, it can be useful when considering prevalent attitudes toward HIV/AIDS in the Arab world. The social imaginary of the state(s) can be summed up as follows: HIV/AIDS is a disease resulting from homosexuality and drug use, both of which are forbidden by Islam. Thus, HIV/AIDS is perceived as a moral problem—specifically, an invasion of Western (i.e., non-Islamic) immorality into the Islamic moral sphere—rather than a health issue.

The discrimination faced by people living with HIV/AIDS in the Arab world is often life threatening, which helps explain why the official numbers of HIV infection issued by Egypt and other Arab states are incredibly—unbelievably—low. In some cases, such as that of Egypt, the statistics that UNAIDS provides are remarkably different from the official numbers provided by the Egyptian government (Khamis 2015). The appalling lack of present treatment options in the Arab world is reminiscent of what queer, black, and Latino communities in the United States and the United Kingdom faced during the outbreak of AIDS in the 1980s and early 1990s. Although testing for the HIV antibody was never mandatory in those countries, the mainstream press and certain public figures repeatedly called for the publication of test results, as well as quarantine and isolation for those carrying the virus. People were reluctant to get tested for HIV out of fear of job discrimination, the loss of access to health care, and so on. This only exacerbated the risk of becoming unknowingly infected because people shied away from learning their serostatus. A similar situation can be found in the Arab world today, where people are reluctant to get tested because of the lack of anonymity and the probable loss of employment.

Despite the social taboos associated with HIV/AIDS, there have been many filmic, television, and web productions that address the pandemic in the Arab world. Particularly significant is Amr Salama’s highly acclaimed film Asmaa (2011). Asmaa is unique as it is the only feature-length film from the Arab world that focuses on HIV/AIDS as a central theme in a way that is not disparaging or didactic. In earlier films—also from Egypt—HIV/AIDS was a metaphor for perversity, excess, deviant behavior, and Western foreignness, propagated through the shock factor and the allure of the abject, horrifying, or diseased subject. A contextual analysis of these films further illustrates how Asmaa adopts new ways of looking at HIV/AIDS, serving to redeem Egyptian cinema from the horrifying perspective it adopted in the 1980s and 1990s.

Ightisab (1989)

The earliest of the films addressing the pandemic in the Arab world, Ightisab (Rape), was directed by Ali Abdel-Khalek and produced in 1989, shortly after the first case of HIV was reported in Egypt. The plot, as ominous as the title, follows three men in their attempt to
rape a nurse. She momentarily escapes them and finds shelter in an army barrack, but when the three men spread the rumor that she has AIDS, the soldiers kick her out, afraid to even touch her. After watching *Ightisab*, an otherwise-uninformed audience would certainly believe that HIV/AIDS is a life-threatening and highly contagious disease that should be avoided at all costs.

**Al-Hub fi Taba (1992)**

In 1992 two films were made in Egypt about AIDS: Ahmed Fouad's *Al-hub fi Taba* (Love in Taba) and Karim Diaeddin's *Al-hub wa al-ruʿb* (Love and terror). In *Al-hub fi Taba*, three friends vacation in Sharm al-Shaykh, a popular tourism spot in Egypt. There they meet three European women, who convince them to go on a joint road trip to Taba, a small resort town on the Sinai Peninsula in northeastern Egypt, along the Gulf of Aqaba. During their time in Taba, all three men engage in sexual activity with the women. When the women leave, they leave individual letters to the men in which they disclose to each of the men that they have AIDS. Upon their return to Cairo, the men get tested and learn that they are all HIV positive. Sheer terror grips them, and they all see their lives fall apart before their eyes. The audience is led to believe that engaging in sexual activity (especially with a foreign woman) guarantees life-threatening repercussions, almost immediately. The film reinforces many of the misconceptions about the ways that HIV can be transmitted: one of the men not only refuses to sleep with his wife, he will not even touch her and eventually divorces her. Another man commits suicide because of his inability to cope with depression and isolation. The third breaks down in a restaurant and tells people around him not to drink or eat on the table where he sat, and he refuses to touch anything belonging to another person. In another scene, a doctor tells one of the characters that isolation is the best option for him because, even though HIV is transmitted only by blood (a bit of misinformation that omits other modes of HIV transmission), he might get injuries or cuts that could cause him to bleed and “spread [HIV] to the country, including his wife and son.”

*Al-hub fi Taba* communicates two central messages to its audience: First, the protagonists' responses to learning that they are HIV positive—suicide and self-isolation—imply that HIV/AIDS should be feared, avoided, and by no means tolerated. Second, foreign women—symbols of the abject and dangerous—should also be feared and avoided. The film uses the clichéd imagery of the woman as viral carrier. Both the foreignness of the women and their HIV status can also be seen as metaphors for the external threat posed by Israel, which directly borders Taba to the east. Indeed, Taba was the last portion of the Sinai Peninsula to be demilitarized and returned to Egypt following the 1979 Egypt-Israel Peace Treaty. Egyptian media has often depicted the peninsula as a wild and dangerous frontier that is susceptible to Israeli corruption (*Swedenburg 2000*).

**Al-Hub wa al-Ruʿb (1992)**
Al-hub wa al-ru‘b is a similar film, albeit with a blunter title. The plot revolves around a beautiful single mother named Hind, who contracted HIV from her now-dead husband. After a night of heavy drinking at bars, Hind is raped. Unable to go back to her parents’ house, she seeks refuge at the apartment of a former lover, Ahmad. Although she is visibly very intoxicated, Ahmad has sex with her. The next morning, she tells him that she has AIDS, and he immediately gets tested. The doctor informs him that he is HIV positive and, moreover, obligated to “turn in” Hind, for a woman like her is a menace to society. The state police track her down, and she is quarantined for some time. The narrative takes an even darker turn when the head of a drug cartel hears about “the woman with AIDS.” He finds out that she is quarantined at a hospital and makes contact with a nurse who works there, who explains how HIV can be transmitted: through sexual activity, blood transfusions, or sharing needles. The cartel then kidnaps Hind and forces her to “infect” their rival, who is secretly sleeping with the wife of the cartel’s head. The rival gets infected, he infects the wife, and then she infects her husband. Hind eventually turns herself, as well as the drug cartel, in to the police.
Another problematic depiction of HIV/AIDS can be found in Inas El-Degheidy’s *Disco Disco* (1993). Featuring two major figures in Arab pop culture, Naglaa Fathy and Mahmoud Hemida, the film briefly mentions HIV/AIDS. When the main character tries to donate blood to help his father, he discovers that he has contracted HIV, presumably from a younger man with whom he had been in a sexual relationship. The only message about HIV/AIDS that this film provides for the audience is that it results from homosexuality.

*Disco Disco* and the other films discussed above did not fare well in theaters. According to one article, audiences found these films morose, depressing, and depraved. At several screenings, audiences simply walked out of the theater (al-Mahdi 2014). At the time that these films were released, fear and paranoia gripped the media and, in turn, the public. Cinematic presentations of HIV/AIDS only solidified this fear and perpetuated misinformed ideas as common knowledge, thereby creating deeply entrenched stigmas against people living with HIV/AIDS, pitting “innocent victims” against “guilty victims,” and inciting widespread fear of contagion in public spaces.

**Asmaa (2011)**

In 2011 Amr Salama released *Asmaa*, a film that signified a major break with earlier depictions of people living with HIV/AIDS. Inspired by true events, *Asmaa* explores the traumatic ordeals that Asmaa, a woman living with HIV, has to contend with in contemporary Egypt. When she develops an acute gallbladder infection, she finds that no doctor is willing to operate on her because of misinformed fears of contamination and cultural contempt. Over the course of the film, Asmaa is forced to confront the stigma of having HIV in Muslim/Arab society, as well as her own fears of familial rejection. Played by the prominent Tunisian actress Hend Sabry, Asmaa hides her HIVpositive status from nearly everyone, including her daughter and employers, with the sole exception being her father. Unable to live normally, in constant fear of being exposed, Asmaa lives in self-imposed isolation, cut off from any friends or family. When a friend from her past approaches her on an extremely crowded street, Asmaa pretends she cannot hear her.

The only social activity Asmaa engages in is a regular meeting group hosted by the Friends of Life Society, a vaguely titled organization for people living with HIV/AIDS. When the administrator of the group learns of Asmaa’s gallbladder condition, he puts her in touch with Ayten, the programmer of a popular and sensationalistic television show called *Hot Tin Plate*, which deals with everyday events in Egypt. Ayten (Samia Asaad) and Mohsen (Maged El Kedwany), the obnoxious and largerthan-life host of the show, offer to expose the difficulties and harassment that Asmaa continuously faces, in the hope of appealing to a doctor or an official who will intervene in her seemingly simple situation. The proposed episode would focus entirely on HIV/AIDS in Egypt, but Asmaa finds herself conflicted when they demand that she reveal her face on air, rather than have it blurred to protect her identity. Ayten tries to persuade Asmaa to comply by telling her that revealing her identity
will help give HIV/AIDS a “personal face,” thus making it easier for the average viewer to relate to people living with HIV/AIDS. Asmaa refuses, however, appearing initially on the show with her face blurred, but when her daughter realizes that her mother is on the show—she recognizes her voice—she calls the show and asks Mohsen to help her mother find the treatment she needs. Once Asmaa hears her daughter, she reveals her face on live television, addressing the audience in a heartfelt plea that she is not dying from a disease that she has but, rather, a disease that they have. The ending scene delivers an optimistic image: Asmaa walks home defiantly amid passersby who seem to recognize her from the show; she directly addresses the viewer, saying that if she did not fear pain, medicine, and stigmatization, she would truly be able to live. This scene invites the spectator to occupy Asmaa’s position, in order to feel—for a few long seconds—the social stigma and compromised anonymity of having HIV/AIDS.

From the beginning of the film, the spectator witnesses the discrimination that Asmaa faces on a day-to-day basis, from being denied basic health care to the loss of employment, to a continued sense of isolation. But because the narrative focuses on Asmaa’s painful personal experiences, the spectator is able to identify with her, an HIV-positive single mother struggling to make ends meet in contemporary Cairo. The portrayal of Asmaa as a victim/hero, which grants the film moral legibility, is central to the theme and message of Asmaa. By positioning Asmaa as a victim of stigma and the state’s legal bias, the film effectively invites the audience to recognize and feel Asmaa’s victimhood—a drastic change in identification in comparison with earlier films where the female protagonists were depicted as dangerous and infectious carriers of the disease.

Although the narrative of Asmaa does not focus on homosexuality (perhaps on account of censorship laws) it effectively dispels the idea that HIV/AIDS is a “gay” disease, as opposed to the common rhetoric of health campaigns. The fact that all the people living with HIV/AIDS in the film who speak about how they became infected are heterosexual is not an instance of respectability politics, but rather a clear attempt to steer away from homophobic narratives by emphasizing the many different ways that one can contract HIV. The media in the Arab world has fueled homophobia by linking it to HIV/AIDS, but in Asmaa, heterosexual sex and transfusions are posited as ways of contracting HIV. This is especially relevant for audiences in the Arab world, and specifically Egypt, where most of the new HIV cases are women who have been infected unknowingly by their husbands (UNAIDS 2012).

Yet Asmaa was still considered controversial simply by virtue of being a film about HIV/AIDS and, thus, automatically invoking associations with homosexuality and promiscuity. Many locations refused the film crew access to their premises, and the actors and actresses had to consider the likelihood that they would be less marketable in the future. Despite this, Asmaa has been awarded eighteen Egyptian, Arab, and international awards since its world premiere at the 2011 Abu Dhabi Film Festival, where it won the
award for Best Director from the Arab World in the New Horizons competition; it also garnered the audience award at the 2012 Fribourg International Film Festival. More importantly, the film has been received very positively in the Middle East, indicating at the very least a general interest in HIV and AIDS discourse. In fact, a small UNAIDS study of Asmaa’s effects on Egyptian audiences shows that 61 percent of respondents to an online questionnaire would positively accept Asmaa in all the listed scenarios of social interactions that the study poses, whereas they would not have done so before (El Beih et al. 2012). In Egypt, television represents the main source of information on HIV/AIDS for more than 90 percent of men and women (UNAIDS 2012). Thus, it is highly likely that Asmaa will be instrumental in changing the public’s opinions on the topic for the better—unlike earlier Arab films about HIV/AIDS, which were instrumental in misinforming and horrifying audiences.

More recently, television serials have also discussed the issue of AIDS in the Arab context. One example is the popular Syrian show Hajez al-samt (Silence barrier), which was released in 2005 and is available in its entirety on YouTube. Even more recent is the Egyptian television show Zawaj bil ikrah (Forced to marry), released during Ramadan in 2015. Despite the producers’ attempt to establish a so-called neutral depiction of people living with HIV/AIDS, both television shows rely on tropes of fear and contagion that were evident in the films discussed above.

**FILMOGRAPHY**

In 2012 pre-exposure prophylaxis (PrEP) became available. This HIV-prevention tool offers a pharmaceutical mode of reducing the risk of infection. The method involves prescribing HIV medication to people with a negative HIV status but who are considered, or indeed consider themselves, to be at high risk of infection with HIV. If the daily course of oral tenofovir is taken properly and continued, the drug promises a significant protective quality against infection, five days after starting. With PrEP, an easy, affordable, and reasonably reliable mode of prevention was introduced with the hope of overcoming the weaknesses of common barrier methods of HIV prevention. Although the implementation of PrEP continues to raise critical questions about treatment access in the global arena, and although the profiling of high-risk populations remains a difficult task, it seems as if the old paradigm of prevention is being replaced.

PrEP has been greeted with mixed feelings from communities, activists, insurance companies, and national health systems. Certainly there is enthusiasm about a reliable pharmaceutical mode of prevention, and PrEP seems like it could be an essential and feasible steppingstone to a much-anticipated goal: the end of AIDS. But critics point to the potential dilution of a potent and reliable politics of prevention, built on social, cultural, political, and behavioral change that was long believed to be the gold standard for containing the epidemic: changing the public’s attitudes to the disease; addressing stigma as both a social and private issue; introducing safer sex practices; educating about possible and plausible transmission routes; distributing condoms; and sustaining a community of self-help and support groups in a more or less consolidated partnership with public institutions and state departments. But do these responses constitute a model of AIDS prevention that is now at risk? Or is it only through a retrospective view on a set of potentially endangered routines and practices that the many histories of battling the impacts of the epidemic, both immediate and prolonged, on queer communities across Europe appear to have constituted a characteristically European model of AIDS prevention?

Another key feature of PrEP’s introduction is that responses have not fallen into the same
trenches that characterized many of the conflicts in AIDS history. Activist communities are split; some activist voices are aligned—some intentionally, others accidentally—with pharmaceutical marketing strategies. Medical professionals, policy makers, and public health institutions across Europe have responded with mixed sentiments to the successful outcomes of PrEP clinical trials (Spieldenner 2016). These new alliances between industry, state, and activists, as well as the new fault lines within communities, escape familiar pathways of AIDS history to date. The opposition between narratives of activism from below versus official historical records of the progressive scientific overcoming of the epidemic has ceased to dominate the scholarship.

But some questions remain the same: Who was it that changed the face of AIDS? Who was responsible for turning the once-inescapable death sentence of an HIV infection into a manageable chronic condition to live with? Who changed the shape of the accelerating case registries and brought about the reduction of infection rates in Europe? It may be tempting to assign successes to queer communities and their manifold inspiring stories of resistance, survival, and care provision. But in doing so, one risks overlooking the pervasive capacity of the AIDS epidemic to have transformed so many certainties of Western separations between medicine, activism, and both social and sexual identity (Treichler 1999; Yingling 1997).

Looking to the history of AIDS activism in Europe and elsewhere, historians will always have to ask who counted and who counts in today’s record as an “activist.” When Peter Staley at the Sixth International AIDS Conference, held in San Francisco in 1990, asked an audience of over 1,000 attendants to stand up with ACT UP (AIDS Coalition to Unleash Power) and join the ranks of AIDS activists, the activist category was generously extended to biologists, geneticists, epidemiologists, public health officers, politicians, and journalists, as well as cultural analysts, social scientists, and historians (France 2016). Such a gesture subsequently caused conflict within ACT UP and has since been seen as an end to a particular AIDS activist history in the United States. For the case of AIDS history in Europe, such overarching symbolic and controversial gestures are hard to find. The reason might be that such invitations to reconciliation required a preexisting history of conflict, strong opposition, and deep-felt mistrust toward both state-sponsored institutions and the medical research community—a story that to a certain extent remains exclusively an American experience.
AIDS in Europe

There are still, however, many parameters that characterize this epidemic's exceptionalism and that have remained the same across the Atlantic. In advance of HIV's emergence in the early 1980s, the era of infectious diseases was hubristically thought to be over. Smallpox had been eradicated, and polio cases were dwindling. After AIDS arrived, medical institutions—especially in clinical medicine—found themselves overwhelmed and largely powerless in dealing with the opportunistic infections and cancers that brought about the untimely deaths of thousands of previously healthy young patients. While it quickly became clear that specific pathways of transmission structured the dissemination of AIDS among particular risk groups, uncertainty about the virus itself and the clinical picture of AIDS prevailed despite mounting pressure on public health to “solve” the epidemic. It was painfully clear that traditional public health strategies of prevention were ineffective. At the same time, new strategies were emerging out of the young, male, homosexual, and other minority communities affected. The adaption of concepts of sexual education, introducing large-scale social and behavioral change, eventually brought about new alliances between queer communities, states, and public health institutions. These bonds transformed the shape and impact of the epidemic from “exceptionalism to normalization” (Rosenbrock et al. 1999, 20).

But AIDS history in Europe was not uniform. With the final chapter of the Cold War dominating the epidemic’s first decade, policy and the public visibility of AIDS and the policies relating to it differed drastically from East to West. Most of the policies of eastern European states followed doctrines from Russia, but the stories differ when one looks at the situation on the ground across eastern Europe. For most western European states,
there are different versions of how the emerging epidemic affected ongoing processes of gay liberation. Rarely was this an isolated national process; rather, it was a story of outstanding international and global networks, which—especially when confronting AIDS—showcased impressive supranational infrastructures, reaching from South Africa to Norway, the United States, and beyond (Mbali 2013; Woods 2016).

This overview begins with the cases of France and the United Kingdom, which provide a productive comparison for introduction. Each subsequent cluster is showcased through one or two national case studies to illuminate particular characteristics of how the AIDS crisis was encountered. This outline of Europe’s AIDS activism is predominantly focused on the first decade—the formative years—of the epidemic, but it occasionally looks at later developments.

**A General Approach: France and the United Kingdom**

Despite many differences, the stories of France and the United Kingdom share a common motif. Initial responses to the epidemic were shouldered by small volunteer organizations, made up of a largely gay constituency but characterized by approaches to a politics of prevention that addressed the general public. But the stories of both countries are also structured by a secondary response that developed in the later 1980s, one that encouraged and emphasized an explicitly gay angle to the epidemic that, in turn, renewed a sense of politicized gay identity.

The historian Virginia Berridge (1996) has emphasized that AIDS in the United Kingdom was always a small epidemic compared to other countries. With twenty-nine registered cases by 1983 and just over 2,000 by April 1989, this history deserves attention not despite but because of its low mortality. Specific to the United Kingdom, infectious diseases were tackled through long-established routines of the National Health Service. But with AIDS came a “period of incoherence, of absence of knowledge, of ‘groping in the dark’” (Berridge 1996, 13). Controlling the epidemic required following advice from groups outside of the health service. Listening to the affected communities, who had in turn learned from experiences in the United States, led to an AIDS policy driven from below. Self-help practices presented in a steady stream of literature and leaflets were imported from the United States through what Berridge has called “AIDS missionaries.” The initially scattered developments of help lines, self-help groups, and information meetings to disseminate research news were eventually transformed into the Terry (later, Terrence) Higgins Trust. The trust, named after one of the first persons who died of AIDS (in 1982) in the United Kingdom, had the aim of humanizing the perception of the disease. After a few years the organization centralized both professional policy advice to the National Health Service and community counseling through a successful buddy scheme that paired persons with new infections to people who had learned to more or less cope with AIDS. By comparison, the most visible response in the epidemic’s first decade in France was shouldered by AIDES (a
play on words, referring both to AIDS and to the plural form of the French word for “help,” *aides*), founded in 1984. The Terrence Higgins Trust and AIDES were groups that addressed AIDS as a subject of general interest that had implications for the whole population. Both groups relied on public subsidies for 30 to 40 percent of their operating costs, as well as on fund-raising and volunteer work that was carried out overwhelmingly by gay men.

**AIDS Doctors as Activists** In both the United Kingdom and France, however, the story of AIDS activism would be incomplete without another group of advocates and experts who had a decisive impact on the course of the epidemic: the AIDS doctors. For one thing, the epidemic posed very specific challenges to clinical practice and in particular its impact on the previously marginalized field of infectious diseases. HIV gave birth to a new kind of medical specialist. As the medical anthropologist Jamie L. Feldman (*1995*) has argued, AIDS doctors came to epitomize the change AIDS brought to the doctor-patient relationship, eventually integrating patients’ expertise into every level of decision-making.

In France, the historian Stuart Elden (*2017*) recalled a group of AIDS doctors that originated in the Groupe Information Santé (GIS; Health Information Group). The GIS was a highly politicized health professional body that had formed in the early 1970s around pro-choice struggles regarding abortion. These AIDS doctors had been close associates and collaborators of the French historian and social theorist Michel Foucault, who died in 1984 of AIDS. It was on the initiative of Foucault’s partner, Daniel Defert (1937–), that the same group of doctors formed AIDES in 1984 (*Elden 2017*). A similar group of AIDS doctors in the United Kingdom emerged from the Gay Medical Association, which had been founded in 1980 (as the Gay Medical Information Society) to address various health issues specific to the gay community. In 1983 this collective set up an AIDS working group that developed into the first dedicated AIDS clinic in London.

In both countries, gay men involved in the earliest responses were not in continuity with the history of gay militancy from the 1970s (*Pollak 1992*). In fact, in France, gay groups initially denied the threat of AIDS. Perhaps influenced by the legacy of Foucault and the French queer theorist Guy Hocquenghem (1946–1988), a reluctance to take on a sexual identity with limiting parameters defined in pathological terms certainly contributed to widespread hesitation about accepting the existence of a gay group at risk to a new disease. Dissemination of information was resisted by such influential groups as the Association des Médecins Gais (AMG; Association of Gay Doctors) up until 1984, and only very few, entirely local initiatives began to organize bottom-up self-help structures in the early years. Patrice Meyer, a member of the AMG who had been involved in gay health programs, was among the first to organize community structures such as Vaincre Le Sida (Defeat AIDS), which was founded in 1983 and began setting up self-help groups and translating information material from the United States and the United Kingdom (*Fillieule 1998*).

**Repolitization of AIDS** Yet, as the sociologist Claire E. Ernst (*1997*) has argued, the
practice of generalizing AIDS through the policies of AIDES came into crisis in France at the end of the 1980s and was publicly and militantly challenged by the newly founded ACT UP–Paris. The latter group, patterned after the New York model, embraced links between AIDS and homosexuality to renew the discourse of gay politics in France. With a new focus on making audible previously inaudible voices from marginalized groups such as trans activists and LGBT migrants, ACT UP–Paris used direct action and practices of militant involvement to politicize AIDS. As the celebrated 2017 docufiction 120 battements par minute (120 beats per minute) shows, the group came to symbolize a turning point in French history, when the concept of AIDS as a generalized public health threat led to the mobilization and subsequent politicization of France's gay community (Barbot 2006). The writer Hervé Guibert (1955–1991) has encapsulated many of the community's complex relations to the intellectual heritage of Foucault in his reinvented genre of the patient diary in times of AIDS (Guibert 2015).

On a very different scale, similar conflicts characterized the landscape of activist response in the United Kingdom. The UK government had sent out a leaflet to every household in 1986 as part of a larger campaign to educate the public about the epidemic under the catchy slogan “AIDS: Don’t Die of Ignorance.” But with the government’s decision (under Margaret Thatcher, the nation’s then prime minister) to ban promotion of homosexuality through the Local Government Act of 1988, many believed the previously established politics of consensus had been canceled. The result was a wave of renewed politicized responses. The activist, writer, and art historian Simon Watney (2000) has emphasized the outstanding role of an energetic gay and lesbian press. In the 1990s it was in these forums that the professionalization of AIDS service and the generalized outlook of the Terrence Higgins Trust were increasingly criticized as “de-gaying AIDS.” For Watney, denying the epidemiological significance of gay lifestyle and forgetting about the specific instruments of education to achieve behavioral change amounted to “genocide-by-negligence” (2000, 84). One of the consequences can be found in the formation of Gay Men Fighting AIDS (now known as GMFA) in 1992 as a community-based group with a strong focus on peer education within the gay community.

The trajectories of both France and the United Kingdom showcase the pitfalls of both the community’s and the medical institutions’ efforts to frame AIDS as an issue of concern to everyone. Perhaps driven by resistance to the risks of stigmatization and segregation, both cases also show the vulnerability of such strategies to fall prey to antigay sentiments.

Collaboration and Integration: AIDS in Germany and Switzerland

In his 1993 book Uneins mit Aids: Wie über einen Virus nachgedacht und geredet wird (At Odds with AIDS: Thinking and Talking about a Virus [1996]), the German philosopher
Alexander García Düttmann argued that AIDS would eventually be seen as a turning point; the distribution of the virus would indicate that an era of sexual politics had come to an end. In Germany, as well as in Austria and Switzerland, there had been legal reforms related to sexuality in the 1960s and 1970s and the gay community had found a renewed political consciousness that was scattered among anarchist, socialist, Marxist, and Trotskyist leanings. In West Berlin, the Homosexuelle Aktion WestBerlin (Gay Action Group of West Berlin) shifted its revolutionary vision to the development of a gay community center (opened in 1977); under the name of SchuZ, it now remains the acclaimed heart of the capital’s political gay community. An emerging gay culture led to the opening of the first gay bookstore, Prinz Eisenherz, in 1978, and the founding of publishing houses and magazines gave rise to a rich variety of informal and formal networks, projects, groups, and initiatives that connected the gay community with women’s and student movements at the end of the 1970s.

The first three cases of AIDS were diagnosed among West Berlin gay men in 1983, at which time the epidemic was still widely considered an American problem (if it was considered at all). But searching for the beginnings of a gay response to the disease in Germany, Michael Bochow (2009) points to a remarkable series of meetings in 1983 between a group of gay men with a prolific nurse in Berlin. Here, as in many other European cities, the meeting had arisen from collaboration between health professionals and members of the gay community addressing the surge of infectious diseases such as hepatitis B among gay men in the late 1970s (Bochow 2009). Largely disconnected from the sprawling and scattered political gay community, this group then went on to found Deutsche AIDS-Hilfe (DAH; German AIDS Assistance), which rapidly became the largest and most visible AIDS service organization in Germany.

These first AIDS activists were viewed with mistrust and suspicion by many gay political activists. AIDS was seen as a potentially dangerous instrument with which the tentative advances of gay movements could be undone by conservative governments and antigay media alike. Of course, specific to Germany was the specter of the past—both the memory of how fascism treated homosexuals and the long post-World War II period of continued persecution under the German chancellor Konrad Adenauer (1876–1967). Martin Dannecker (1987), an activist and keen observer of the gay movement in Germany, characterized these early years of AIDS in West Germany as marked by a growing fear of an unknown emerging disease, coupled with concern about a new form of discrimination based on the connection between gay identity and AIDS. Despite the initial mistrust, the DAH managed to maintain its predominant position as an umbrella organization that organized and connected both national and regional activities ranging from self-help groups to advertising campaigns specifically tailored to gay communities, as well as to the general public.

The transfer of knowledge about HIV prevention and safer sex was a focus, but so too were
new ways of community organization. Inspiration was taken again from the United States. The director Rosa von Praunheim (1942–), known for his groundbreaking film *Nicht der Homosexuelle ist pervers, sondern die Situation, in der er lebt* [1971; It is not the homosexual who is perverse, but the society in which he lives], produced haunting documentaries about AIDS activism in New York (*Silence = Death* and *Positive* [both 1990]), which became influential references in and around the DAH. The films portrayed artists such as Keith Haring living with AIDS in New York; they brought the perspectives of activists and patients to the screen and transmitted images both of devastation and of self-help, outrage, and political consolidation around homosexuality and AIDS. Rolf Rosenbrock (1987), a Berlin-based social scientist who was actively involved in the West German AIDS movement, speaks of a drastic transformation of gay life in the late 1980s, as safer sex and the constant visibility of DAH materials led to a significantly reduced diffusion of the epidemic even in the absence of successful clinical interventions.

**Unlikely and Likely Alliances** Important to the success of German AIDS policy was the development of unlikely alliances. While Bavaria remained the only part of Germany in which discussion of coercion and detention of patients was introduced (by the far-right politician Peter Gauweiler), a member of the national conservative government under Helmut Kohl by the name of Rita Süssmuth took on a crucial role in the development of a unique and laudably open health policy in response to AIDS. Süssmuth not only proposed progressive and outspoken campaigns of education and information, but she also encouraged the government’s reliance on advice and perspectives formulated in the DAH. This exceptional alliance led, by the end of the 1980s, to almost all DAH activities being financed through public subsidiaries and accompanied by a constantly growing landscape of social research. Political engagement was carried out by the gay community but largely characterized through popular sex education for a general public audience.

Switzerland had followed the lead of German integration and actively encouraged the integration of gay activists in the development of the state’s response to the epidemic. As a matter of pride, the state showcased its liberal attitude to the epidemic and encouraged the Swiss model of AIDS prevention to be recognized as a successful implementation of community-based activism leading to behavioral change in those communities at risk. It also crucially contributed to the absence of hostility in Swiss society. Friendly relations between members of the DAH in Germany and of the similarly modeled AIDS-Hilfe Schweiz (Swiss AIDS Federation) had facilitated the collaboration between the two groups ([Staub 2005](#)). But already in 1989, the epidemiological focus of the epidemic moved away from gay men and onto the heroin crisis in Zurich. Advocacy for translation of the existing strategies of prevention into a newly emerging field was largely unsuccessful, but eventually one of the most liberal drug prevention policies across Europe emerged. Many of the gay activists who had formed the AIDS policy in close collaboration with German and international collaborators continued to invest in the professionalization of AIDS prevention in Switzerland, as a dedicated condom company (Hot Rubber) was founded, and
many activists embarked on a career in the nation’s health services.

**Pragmatism and Cooperation: The Netherlands and Scandinavia**

A story of remarkable consensus around AIDS and AIDS prevention began in the Netherlands with the national blood bank’s decision to ban gay men from donating blood in 1983. After a short upheaval, a coalition of the Amsterdam public health authorities (the Nederlandse Vereniging tot Integratie van Homoseksualiteit—Cultuuren Ontspanningscentrum [Dutch Association for the Integration of Homosexuality—Culture and Recreation Center] and Stichting Aanvullende Dienstverlening [SAD; Ancillary Service Department; initially an Amsterdambased STD clinic for gay men run by gay physicians]) organized a thorough information campaign together with the national government. This alliance quickly transitioned into an AIDS task force, which was fully financed by government funds but controlled through advocacy from the LGBT community. As in Germany and Switzerland, the main focus in the Netherlands was targeting gay men with tailored messages about safer sex. Shelves of informational material were installed in the majority of gay bars and clubs in the vibrant and renowned gay communities of Amsterdam.

The SAD was particularly engaged in forceful promotion of safer sex practices. Promotion kits containing condoms and lubricants were assembled and distributed by volunteers; workshops to enhance positive attitudes on safer sex were copied from the New York group Gay Men’s Health Crisis and offered from 1987 onward. An infamous safe-sex video was played in bars around the country and, from 1988 to 1990, was shown to 156 different groups, reaching over 3,000 participants (Hospers and Blom 1998).

Similar stories mark the AIDS experience in Sweden and Norway. Small case numbers met a robust background of sexual reform movements dating from the 1960s onward that had contributed to the marked liberal attitude of northern European countries. Gay doctors were involved in the state’s response from the beginning of the epidemic in 1983, and from 1985 onward the central Swedish government aimed to design a progressive and open AIDS policy. Conflicts over whether the disease should be classified as a venereal disease were carried out in public, and both gay groups and feminist activists raised concerns about the impact of coercive reporting. An official AIDS committee was put in place to shape consensus, which included the acceptance of semilegal anonymous testing (Fox, Day, and Klein 1989).

**Outnumbered: The European South**

Southern Europe, especially Greece, Spain, and Italy, appear in a quite different epidemiological light than the rest of Europe. The epidemic started small, with just a
handful of cases in Spain by 1983 and amounting to just fourteen cases in Italy by December 1984. But later there was an unexpected surge. In the early 1990s Spain reported the highest incidence across Europe, and Italy had 3,235 cases by 1988, second only to France in the tallies across the continent (Moss 1990). The reason for both countries suffering an overwhelming epidemic related to intravenous drug users. In Italy, already by 1985 drug users were the dominant risk group. As a result, Italy and Spain both saw a much more variegated demography of patients than elsewhere in Europe. Governments failed to address the epidemic appropriately, and the development of political strategies, the rollout of effective preventive measures, and the introduction of educational instruments happened at an alarmingly slow pace.

A reason for this can be found in the absence of visible national AIDS service organizations, which could have catalyzed the urgency of the patients and people who experienced AIDS firsthand. Without such centralized organs, Italy's and Spain's gay communities did not become legitimate interlocutors in the formation of national AIDS strategies and politics (Moss 1990). A common misunderstanding attributes these developments to institutionalized homophobia in these two largely Catholic countries. But Italy had decriminalized homosexual acts already in 1890, and the 1970s saw a number of highly controversial biopolitical issues dragged out into the streets, reaching from divorce legalization in the early 1970s to the referendum securing a woman's right to abortion in 1981. As a result, the political infrastructures of the gay community had grown to be structurally integrated with leftist movements and parties. The largest national gay organization FUORI! (Out!) had been associated with the Partito Radicale (Radical Party) (Barilli 1999) and was dissolved in 1982 as a result of internal political quarrels.

The second gay national association, Arcigay (Associazione LGBTI Italiana; Lesbian and Gay Association of Italy), was established in 1985, perhaps as a response to the increasing need to rearticulate gay political identity in the face of the emerging epidemic. Calls for a unified voice among the gay community attempted to overcome traditional political fault lines within the community but remained largely unsuccessful. Arcigay continued the community’s traditional association with the radical left, and consequently the influence of Arcigay on the development of national strategies against AIDS was scattered and often contested by local and regional authorities. Given the epidemiological dominance of drug users by 1985, gay voices remained peripheral to such government programs as the Associazione Nazionale per la Lotta contro l’AIDS (National Association for the Fight against AIDS; popularly known by its acronym ANLAIDS) and the Lega Italiana per la Lotta Contro l’AIDS (Italian League for the Fight against AIDS; popularly known by its acronym LILA) (Moss 1990). Instead, the community's contribution found force on a local scale, especially in Rome, Bologna, and Milan, where self-help groups and initiatives emerged in an informal response to the epidemic.

It is remarkable that, despite this unique trajectory of the response to the epidemic, Italy's
population repeatedly demonstrated a significantly less hostile attitude to people with AIDS than that of many other European countries in the 1980s. Whether this is attributable to the large-scale distribution of generalized AIDS information from 1988 onward or to the impact of a very different demography of drug-related AIDS cases among adolescent heterosexuals remains an open question.

**Neglect and Criminalization: AIDS in Eastern Europe**

AIDS histories in eastern Europe are structured by the historical transformation of the Soviet Union into diverging and, at times, vehement nationalist states. The historical record of the epidemic often follows the established narrative of liberalization and democratic transformation after 1990 that separated each national narrative into two distinct stories: the censored and tainted records of the Soviet past and the more or less progressive ways of addressing the developing health crisis around AIDS in the 1990s. Such narratives risk losing sight of the many challenges that were posed to official AIDS policy before 1990, as much as they risk overlooking the continued stigmatization and criminalization in the successor states. This section begins with the history of Russia's principal policy and attitudes regarding AIDS in the 1980s, with the case of eastern Europe then illuminated and exemplified in the national trajectory of Poland.

The official Russian account of AIDS and the development of the epidemic on the ground were incongruous. The denial of promiscuity, homosexuality, drug use, and commercial sex work in the doctrines of the state furthered ignorance as much as it contributed to an increased invisibility of the epidemic (Feshbach 2006). AIDS was seen as a problem of the West, as its modes of infection and transmission were considered foreign values. The explosive result of imposed silence and scapegoating is perhaps best illustrated when the state’s organ, Pravda, had to oppose and publicly reject a widely supported and distributed 1984 letter by graduates of the Moscow medical school demanding that AIDS sufferers be left untreated in order to purge the Russian nation of what they saw as the deserving victims of the illness.

Much of the public and medical attention regarding AIDS was given to cases of so-called innocent victims, such as the very first officially registered case in the Soviet Union: a fourteen-year-old girl who had contracted the disease after receiving a blood transfusion in 1975. But after the first mortality—a female sex worker who died in 1988—propaganda focused on punitive rhetoric supported by legislative initiatives to encourage mass screenings and to criminalize any behavior that could cause infection.

A reported scarcity of disposable needles, coupled with an atmosphere of intimidation and neglect, led to localized outbreaks. In one rural hospital “it only took one infected child, whose father had contracted the disease through a blood transfusion or homosexual contact while living in Africa (although this information is somewhat suspect), to result in
The initial infection of 27 others” (Feshbach 2006, 22). Medical mistakes and faulty equipment counted for an estimated 50 percent of all recorded cases of AIDS in Russia for the period from 1987 to 1990. These estimates remain unreliable as the actual numbers would not only exceed the official record but probably suggest a very different epidemiological picture.

Historians generally assume that Russian authorities knew little about the behavior of risk groups. Homosexuality was forbidden and condemned to the shadows of urban centers. Prostitution, too, went unacknowledged and was widely illegal. Educational information about transmission risk was scarce and distributed only via informal networks. A seropositive diagnosis was often kept a personal secret, and safer sex practices remained the exception up until the early 1990s. Only then did communities speak out publicly; groups of patients, along with LGBT activists, raised their voices to establish fragments of a precarious state strategy against the epidemic, while hostile antigay sentiment and politics continued to be an opposing force into the twenty-first century.

The Case of Poland The Polish historical arc follows a similar trajectory. But Poland showed a comparably lower incidence of AIDS, and the background of the relaxing effects of the Solidarność (Solidarity) movement since 1980 allowed for a slightly different picture to emerge. Despite the newfound freedom to engage in public controversies around social problems, the issue of homosexuality remained taboo. The state’s reaction to the first AIDS cases in Poland was driven by testing regimens with inflated risk definitions. A mass testing campaign in mid-1988 of 1.7 million Poles revealed 88 cases, of which 60 percent were attributed to homosexual transmission. In 1985 the state brought forward an official AIDS council that introduced large-scale education campaigns and legislation that included a punishment of up to three years of imprisonment for vaguely defined “infectious behavior.”

The situation for Polish citizens affected by AIDS was dire: Barbara A. Misztal reported in 1990 that “members of the three currently most significant risk groups—homosexuals, intravenous drug users, and prostitutes—are in any case unable to identify themselves as part of distinct communities due to a characteristic mix of legal prohibition and deep social disapproval” (167). But on a smaller scale, AIDS was also a catalyst that led to formulations of legal rights for marginalized sexual identities and helped articulate a gay Polish consciousness. In 1987, when state police began to use AIDS as a pretext in the infamous “Hyacinth” operation to raid queer spaces and establish invasive surveillance measures with the aim of creating a comprehensive gay registry, the Warszawski Ruch Homoseksualny (Warsaw Homosexual Movement) formed an organized response. Denied government approval, the movement continued a semi-clandestine existence until the early 1990s, organized both through increasing participation of Polish gay activists in international LGBT conferences and a large international network of gay Poles living in Vienna, Berlin, London, and Paris. In Poland, AIDS had facilitated an accelerated organization among Polish gay men.
Over the course of the 1990s, AIDS began to disappear across Europe and was replaced with an ethic of care for people with HIV. The epidemic became a chronic condition, manageable through pharmaceutical interventions and curbed in its distribution through well-established practices of safer sex, supported by an increased capacity in societies to engage openly with matters of sexual practice and the politics of sexual identity. Inescapably, the success of gay liberation across Europe is intimately tied to the history of AIDS and HIV. The epidemic consolidated transnational gay politics and installed the queer community as an authority for a new kind of public health.

HIV/AIDS in Latin America and the Caribbean

TIMOTHY FRASCA
Research Project Manager, HIV Center for Clinical and Behavioral Studies
New York State Psychiatric Institute and Columbia University

The social and government response to the HIV/AIDS epidemic in this region, including the close relationship between AIDS-related activism and LGBT activism.

When the HIV/AIDS epidemic reached Latin America in the early 1980s, sex between men was by far the principal risk category. But for the most part, gay men in the region, unlike their counterparts in Europe and North America, did not have the benefit of a decade of vigorous agitation and organization to build upon. Instead, LGBT rights promotion largely emerged from the HIV epidemic itself as individuals joined together to address the needs of their peers, pushed the topic into public consciousness, and tapped an unexpected vein of resources, both material and intangible. The early linkage of HIV and LGBT advocacy and the ambiguous relationship between the two causes continue to affect public perceptions, state responses, and organizational realities in the region to the present day.

The social response to HIV/AIDS in Latin America was different in a number of ways that also affected the movement for LGBT rights. HIV appeared throughout the continent in tandem with the restoration of democratic rule after lengthy periods of dictatorship. For example, Brazil’s first case was diagnosed in 1982; military rule there ended in 1985 after twenty-one years. Coups led to military regimes in Bolivia (1964–1982), Argentina (1976–1983), Uruguay (1973–1985), and Chile (1973–1990); these dictatorships were ceding power to civilian governments just as the first HIV cases were being discovered (Chile, 1984; Uruguay, 1984; Argentina, 1985; Bolivia, 1985). While students and workers around the continent filled the streets denouncing military rule and opposition magazines began to appear in kiosks, independent unions, opposition parties, women, students, ethnic minorities, the unemployed, and even sexual minorities demanded a hearing. AIDS activism came of age in the 1980s and 1990s alongside a renewed sense of people’s rights as citizens with individuals and groups of all sorts beginning to press for change.

The discourse of human rights struck an especially profound chord in the many Latin American countries that were awakening to the horrors of state-sponsored torture, murder, and forced disappearance that had suppressed dissent for decades. In this dynamic atmosphere, LGBT claims for full equality could also get a hearing, intermingled with demands for a humane response to the HIV epidemic that respected personal dignity.
Women's demands for reproductive rights also gained new prominence, and activists from these interrelated issues often allied.

In certain parts of Latin America, both the response to HIV/AIDS and the movement around LGBT demands also were influenced by civil warfare, such as the Salvadoran and Nicaraguan civil wars of the 1980s and Guatemala’s forty-year conflict starting in the 1950s. This context of extreme violence continues to affect the two issues throughout Central America and in Colombia where hundreds of thousands of citizens were displaced by the fighting. Colombia’s civil conflict officially ended only with a 2016 peace agreement. LGBT and HIV activism in these nations is more frequently combined into a single entity, especially where the public sector is so fragile that independent agencies often fill the gap with direct services ranging from telephone hotlines and support for HIVpositive persons to clinical treatment offered as an alternative to overburdened public-health facilities.

At the same time, the strong cultural presence of religious institutions—especially of the Catholic Church and a growing evangelical movement—influenced the political and social debates that inevitably sprang up around the epidemic and reflected contradictory tendencies. On the one hand, Catholic criticism of sexual liberalism was often relentless and was taken up by the burgeoning non-Catholic evangelical sector in even harsher terms. However, Catholic tradition also includes a strong role for charity and compassion, especially toward the weak, sick, and vulnerable, and this strand of belief was influential. These debates, ostensibly about how to address a public-health issue, strongly marked the ways in which Latin American societies understood the phenomena of HIV/AIDS, homosexuality, and gender variance and how they were incorporated into the region’s persistent ideological, cultural, and political battles.
Now that the AIDS epidemic is well into its third decade in Latin America, new factors have come into play, and the interplay between HIV and LGBT rights has evolved in diverse ways. Governments have, in some cases, cooperated with grassroots groups and nonprofits and incorporated the voluntary sector—including a strong LGBT presence—into their overall response to HIV, encouraged by multilateral agencies such as the Joint United Nations Programme on HIV/AIDS (UNAIDS) and the Global Fund to Fight AIDS, Tuberculosis, and Malaria (Global Fund). In other cases, governments have pulled back from engagement with LGBT-dominated HIV/AIDS nonprofits, favoring a more traditional public-health approach, accelerated by the advent of effective antiretroviral (ARV) treatments that refocused the epidemic to the clinical setting. Legal changes in the status of LGBT persons and their rights to adoption and marriage also have evolved rapidly, though unevenly, across Latin America.

Activism in Latin America also benefited from one important advantage, a shared language (Spanish, with some exceptions) that makes regional exchanges and cooperation fluid. Newsletters, policy statements, government awareness campaigns, continent-wide calls for solidarity, and the like are easily shared allowing groups to compare program ideas and political strategies boosted by the contributions of Brazilian colleagues in Portuguese
Regional meetings flourished, and a series of coordinating bodies sprang up to unite fledgling Latin American HIV/AIDS grassroots groups along with alliances among entities promoting LGBT rights.

**Visibility**

HIV/AIDS put the notion of different sexual orientations into public consciousness in Latin America in large part because the earliest cases were so heavily concentrated among gay men. Although health authorities were quick to emphasize that the risk of HIV infection involved all sexually active persons and often focused their concern on the “general population,” the male/female ratio of the first wave of infections was in the range of thirty to one in many countries. Early media reports took note of the heavy disease burden among gay men, sometimes in crude or derogatory terms. Involuntary outing was common as HIV-positive men facing deterioration in their health could not conceal their illness or the probable source of the infection.

Herbert Eustáquio de Carvalho, known as Herbert Daniel (a name he assumed while operating underground as a radical opponent of the Brazilian military dictatorship), was a pioneering Brazilian AIDS activist, writer, and revolutionary. He entered medical school in 1965, the year after the armed forces overthrew Brazil’s legally constituted government. Although he had had furtive sexual encounters with other men, he decided to repress his homosexual desires when two years later he joined a revolutionary organization that sought to topple the dictatorship by organizing Cuban-inspired rural guerrilla activities. Feeling that his sexuality was incompatible with the Left’s conservative attitudes, which mirrored conservative religious and social notions of appropriate gender behavior and heteronormativity, he remained celibate for the next four years.

In 1970 Daniel participated in rural guerrilla training in the Atlantic rain forest of the state of São Paulo. Later that year, with the arrest and torture of many comrades, he helped abduct the German ambassador in Rio de Janeiro to obtain the freedom of forty political prisoners. A second kidnapping, of the Swiss ambassador in the same city, resulted in the release of an additional seventy political prisoners. Soon thereafter, his organization collapsed.

After living six years underground, Daniel slipped out of the country with Cláudio Mesquita, who had hidden him. While in European exile, the two became lifetime partners. Daniel returned to Brazil in 1981. Two years later he wrote “A síndrome do preconceito” (The syndrome of prejudice), the first in-depth critical analysis about AIDS produced in Brazil. His essay contains two revolutionary ideas, which became
core concepts behind his AIDS activism in Brazil. The first argued that the best way to
combat the exclusive focus on the medical aspects of the disease is through a solidarity
network to support people living with AIDS. Second, he called on homosexuals and
others to participate actively with medical professionals and government officials in
finding ways to prevent new infections and, eventually, in finding a cure.

Daniel ran unsuccessfully for the Rio de Janeiro state legislature in 1986 as an openly
gay candidate. He organized a colorful campaign that defended gay and lesbian rights,
among many issues. He later worked as a writer for the Associação Brasileira
Interdisciplinar de AIDS (Brazilian Interdisciplinary AIDS Association), the first major
organization working on HIV/AIDS education and prevention in Latin America. In
1989 Daniel discovered he had AIDS. Almost immediately, he founded Grupo pela
VIDDA (Grupo pela Valorização, Integração e Dignidade do Doente de AIDS [Group for
the Appreciation, Integration, and Dignity of those with AIDS]), the first
nongovernmental organization for people living with HIV/AIDS.

Within the AIDS movement, Daniel criticized Luiz Mott, the leader of the Grupo Gay da
Bahia (Gay Group of Bahia), who argued that the slogan “AIDS Kills” had an
educational value because it scared misinformed and uneducated people into learning
about the virus and taking precautions. Daniel countered by calling for AIDS education
and prevention while humanizing those infected, arguing that discrimination was
deadlier than the disease itself. Prejudice, he insisted, condemned people to a “civil
death” (*morte civil*), or the loss of all rights to exist, to be, to be alive.

Daniel died in 1992 with his partner by his side. Jonathan M. Mann, the former head of
the World Health Organization’s AIDS program, who paid particular attention to
addressing the impact of the disease in the Global South, dedicated *AIDS in the World*
(*1992*) to Daniel, quoting him as follows: “I hope that one day, when death finally
comes by chance or by any infection caused by the virus, nobody says that I was
defeated by AIDS. I have succeeded in living with AIDS. AIDS has not defeated me.”

The increased visibility of homosexuality arising from HIV was therefore a mixed blessing. In countries where police raids on semi-clandestine gay nightspots were common, the HIV-homosexual link reinforced repressive tendencies, such as in the notorious 1989 roundup of 300 revelers at the gay club Piccolo Mondo in Valparaíso, Chile, a year before the end of the Augusto Pinochet dictatorship. The detainees were transported at gunpoint to a local STD (sexually transmitted disease) clinic in the predawn hours for forced HIV and syphilis tests, which resulted in the diagnosis of three HIV cases. When a newly formed AIDS education group protested the police action, activists discovered that the head of the Valparaíso public-health service, a physician, had ordered the raid herself.

Widespread scapegoating of gay men (as well as sex workers, intravenous drug users, and transgender women) as “carriers” of the dreaded new disease afflicted gay and trans populations throughout the continent and indeed the entire world. HIV tests as prerequisites for employment, firings of those discovered to be HIV positive, social ostracism, mockery, and blaming were rife. On the other hand, dramatic and somewhat sensationalistic accounts of the devastating progression of the disease struck a sympathetic chord among many citizens. Friendly media coverage tended to highlight monogamous women who had acquired HIV through the extramarital conduct of their spouses, a reinforcement of the “innocent victim” theme. In fact, continued neglect of the prevention needs of homosexually active men despite the epidemiological evidence led a prominent researcher to speak of a “hidden epidemic” well into its second decade (Cáceres 2002).

The Surge in LGBT Activism Nonetheless, gay men became more and more visible as many of them went public to demand improved health services and to combat the stigma related to both the disease and to homosexual behavior. For example, gay activists pushed the São Paulo State Secretariat of Health to respond to the burgeoning epidemic in Brazil’s largest city, leading to the establishment of the first governmental AIDS program in the country in 1983. Throughout the region, television reporters covering the alarming new disease eagerly sought first-person testimony from individuals facing an HIV diagnosis, and...
many of these witnesses were frank about their gay or trans identity. An important early role for these militants was education about transmission routes in an attempt to allay the widespread panic about sharing public spaces, schoolrooms, job sites, and the like with HIV-positive persons, fears that caused direct harm to the individuals diagnosed earliest. When health ministries institutionalized such educational outreach projects, these courageous pioneers often provided the testimonials. Whatever the mixed messages people received about homosexuality, gay men and soon lesbians and transgender persons were now visible in the HIV era in ways that diverged markedly from the discreet silence that enveloped same-sex behavior prior to the advent of the disease (Pecheny 2003).

LGBT activism in a few Latin American countries had begun well before the advent of HIV, establishing links with allies in key US and European cities. In Brazil, for example, homophile groups had early successes in igniting a movement, suffered setbacks, and later reemerged in force as the dictatorship of 1964 to 1985 crumbled. Although activists were unable to get sexual orientation added to the list of protected categories in Brazil’s new 1988 constitution, the HIV epidemic catapulted LGBT leaders into a strategic alliance with sympathetic medical personnel to mobilize a response to the public-health emergency (Galvão 2000; Pecheny and Corrales 2010). Brazil’s national AIDS program supported gay-oriented HIV advocacy organizations, and the country’s success in keeping new infections below early projections added prestige to the gay-friendly “Brazilian model” of fighting AIDS.

Similarly, in Argentina, the Comunidad Homosexual Argentina (CHA; Argentine Homosexual Community) sprang from a 1984 mass meeting in a gay Buenos Aires disco that had suffered a police raid at a time when patrons were no longer resigned to accepting them—a striking parallel with the Stonewall uprising fifteen years earlier in New York City. CHA reflected the spirit of the times with its slogan “Sexuality is a human right.” Its first newspaper ad denounced “discrimination and repression” as inconsistent with democracy, thus explicitly linking LGBT rights with the emergence from dictatorship. This posture dovetailed neatly with the human rights focus soon promoted by HIV/AIDS activists, which drew on emphatic support from the World Health Organization (WHO) Global Programme on AIDS and its successors.

Even where LGBT rights had a pre-AIDS head start, HIV provided these groups—especially those led by gay men—with a new focus based on concrete demands for better health-care services and educational programs tailored to their sexual practices. Their HIV-related work attracted resources that enabled them to establish headquarters, fund activities, and even pay staff. Media interest in the epidemic provided a steady flow of coverage of attempts to combat stigma and discrimination in which fear of HIV and prejudice against homosexuality were inextricably mixed. The publicity brought the existence of the organizations into the spotlight, attracting new adherents.
Prevention campaigns sometimes included references to the risks of homosexual encounters, although explicit discussion of anal intercourse was usually avoided. However, the emphasis on condom use as a protective measure meant that educators could hardly avoid touching upon the varieties of sexual practice that required such a barrier. In fact, LGBT citizens benefited from the growing realization that all sexuality should be dealt with more openly if society were to be successful in addressing an epidemic transmitted through sex. Transgender populations also benefited from increased notice, and advocacy groups of transgender women sprung up in many cities.

At the same time, the new demands for more open discussion of sex and for sex education for young people sparked heated ideological debates, and opponents of liberalizing tendencies quickly mobilized to resist change. Catholic groups such Opus Dei and evangelical Protestant pastors were (and remain) prominent in resisting everything related to reproductive and sexual rights, including comprehensive HIV/AIDS education and later expansion of LGBT citizenship and legal rights.

**The Rise in Trans Advocacy** Activism among trans populations also got a boost from the social response to the epidemic as the early HIV/AIDS-related nonprofits often provided an organizing space and helpful connections. Though trans groups often placed higher priorities on issues like violence and police harassment, HIV quickly became a major problem as incidence rates among trans persons skyrocketed (Poteat et al. 2016). For example, activists in one of the earliest HIV/AIDS nonprofits to form in Brazil, the Grupo de Apoio à Prevencão de AIDS/Rio Grande do Sul (GAPA/RS; Group for AIDS Support and Prevention/Rio Grande do Sul) in the southern city of Porto Alegre, quickly established contacts within the commercial sex trade by distributing condoms in prostitution zones. This outreach put them in touch with trans sex workers, who participated in a historic Encontro de Prostitutas (Prostitutes’ Gathering) in 1989. GAPA/RS later sponsored a discussion group for trans sex workers, which was rocked by the 1994 murder of a nineteen-year-old participant by a client. The incident led to a march against anti-trans violence in downtown Porto Alegre joined by feminist and human rights groups, as well as to a new level of public consciousness about this highly vulnerable population.

In Argentina, trans advocacy groups, such as the Transsexuales por el Derecho a la Vida y la Identidad (TRANSDEVI; Transsexuals for the Right to Life and Identity) and the Asociación de Travestis Argentinas (ATA; Argentine Transvestite Association), began with a similar focus on legal demands, including opposition to laws against cross-dressing, homosexuality, and prostitution, which were decriminalized in the Buenos Aires municipality in 1996. Further achievements followed with the 2012 passage of the country’s Ley de Identidad de Género (Gender Identity Law), which granted all citizens the automatic right to change their name and sex on their national identity cards as well as access to gender reassignment surgery without prior medical, psychiatric, or judicial intervention. Social and political sympathy for the trans cause was boosted by the steady
increase in visibility of LGBT groups and their role in the HIV/AIDS epidemic, which also led Argentina to establish marriage equality for same-sex couples in 2010.

**Legality**

The appearance of HIV/AIDS across Latin America had a marked impact on the legal status first of homosexual behavior and eventually on the civil rights and protections accorded to LGBT persons and same-sex unions. Conditions for LGBT populations in Latin America in the pre-AIDS era were generally bleak. Some antisodomy laws were repealed in the nineteenth century, but in 1999 half the region still criminalized sodomy. Other statutes for acts “against public morality” were not systematically enforced, but their existence made it easy for police to raid gay nightspots arbitrarily; most of these venues existed in a state of semiofficial tolerance facilitated by bribes. Legislators might sympathize with those advocating repeal, but attempts to do so attracted hostile attention from religious fundamentalists ready to denounce what they saw as a weakening of moral standards, and politicians were reluctant to act in favor of a stigmatized and unorganized community.

**Liberalization of LGBT-Related Laws** That changed with the consolidation of HIV-focused and LGBT rights groups whose rhetorical rallying cries echoed each other. The pace of change, although uneven in the region, has been remarkable since the 1990s. The epidemic provided a powerful argument for doing away with such laws. As early as 1989, WHO and other United Nations bodies began to link human rights and public health, and by the 1990s were urging countries to remove antisodomy laws from statute books, arguing that decriminalizing homosexual behavior and reducing stigma were key elements of sound HIV policy ([OHCHR/UNAIDS 2006](#)). By 2008, all Latin American (though not Caribbean) countries had done so.

Easing the legal ban on homosexual conduct as a public-health measure brought the debate about other discriminatory laws into public view. As in the United States and the developed world, the tragedies related to AIDS deaths led Latin American societies to rethink civil unions or marriage equality. Anecdotes of bereft gay partners losing their shared patrimony or being excluded from the bedside at crucial moments by disapproving relatives awakened many in the region to the practical consequences of leaving LGBT persons without the protections afforded by recognized unions. Marriage equality was later enshrined into law, with the Federal District of Mexico City ([2009](#)) and Argentina ([2010](#)) leading the way (Uruguay had formalized same-sex civil unions in 2008). In legislation that outstrips that of many US states, Argentina added full recognition of transgender identity in permitting citizens to select their gender description for identity documents and offering hormone therapy in public-health facilities—often supplied in transformed HIV testing sites dubbed “LGBT-friendly clinics.”

The liberalization of LGBT-related laws routinely proceeded by means of a combination of
internal and external pressure. An example is that of the CHA, which failed to obtain legal recognition as a nonprofit despite appeals all the way to the Argentine Supreme Court. Gay activists surprised Argentine president Carlos Menem during a visit to the United States in 1992 and pressed him on the issue. In response, Menem announced that he would use his discretionary powers to grant the group its charter.

**Opposition from Religious Groups** But even limited progress in this area was not linear, and weak LGBT groups, especially in Central American countries with well-connected, ideologically hostile, evangelical movements, could find themselves outmaneuvered by political operators, often based in religious groups, with links to powerful state actors. Ecuador's constitution of 1988 surprisingly included sexual orientation among its list of prohibited discrimination categories along with race, ethnicity, sex, religion, and so on—the first country in the Western Hemisphere to do so. But the victory was partially overturned a decade later when church groups campaigned intensely against enshrining LGBT and abortion rights in a new version of the constitution in which same-sex marriage and adoption by same-sex couples were both prohibited. Similarly, LGBT gains in Venezuela's 1999 constitutional process, initiated by President Hugo Chávez, were undermined when sexual orientation was quietly dropped from the protected-group language after last-minute visits by religious figures to the main parliamentarian responsible for producing the new constitution's text ([Pecheny and Corrales 2010](#)).

Violence against LGBT persons, still widespread throughout the region, stimulated legal advances in at least one case. When a gay youth was murdered by neo-Nazis in Santiago, Chile, in 2012, the Chilean legislature dusted off an antidiscrimination bill that had lain dormant for years and hurriedly enacted it as the “Zamudio Law” in memory of the victim.

**The Fight for Access to Medical Treatment** The arrival of effective ARV medication in the mid-1990s was another key area for legal activism, especially after the 1996 Vancouver International AIDS Society conference unveiled the highly effective triple therapy “cocktail.” Legal action in this area was nearly universal throughout the region and gave LGBT-friendly advocates important experience in driving their demands through judicial or legislative channels. Most governments in Latin America refused to provide the costly new pharmaceuticals until forced to do so by the courts, and HIV/AIDS nonprofits were quick to use the judiciary to this end.

Brazil's HIV/AIDS advocates successfully pushed for coverage through lawsuits, and the country soon established the principle of universal coverage, as this was consistent with the postdictatorship constitution of 1988. Another early success occurred in Costa Rica where the government initially avoided a commitment to drug purchases until activists sponsored a series of individual lawsuits demanding access to treatment. Faced with a steady barrage of demands and sensitive to the human rights–based appeal, Costa Rica in 1997 gave in after just four months of legal wrangling. In other cases, the legal route was
stymied, requiring action by the legislative and executive branches before treatment access was ensured. Chile's judicial system did not allow for class-action precedents, resulting in the tragic phenomenon of successful rulings after some plaintiffs already were deceased. Only with the reform of the Chilean health system in 2004 did ARVs enter the formulary of universally required medications.

In poorer and more polarized countries of Central America still affected by the years of violent internal warfare, governments did little to respond to treatment needs until external resources became available, either through the Global Fund, the Clinton Global Health Initiative, the US Agency for International Development (USAID), or the President’s Emergency Plan for AIDS Relief (PEPFAR). As of 2017, El Salvador, Guatemala, Honduras, and Nicaragua were all beneficiaries of drug purchasing support from one or more of these sources, but the Global Fund was moving steadily to close out its programs as the countries were now classed as “lower middle-income with low or moderate disease burden” (Global Fund 2018). In these countries, HIV activism has not spilled over into success for LGBT advocacy, in part due to hostility toward human rights discourse and the heavy influence of anti-LGBT evangelical groups.

**The Anomalous Case of Haiti** One somewhat anomalous case is that of Haiti, whose population was highly stigmatized as a “risk group” at the outset of the epidemic due to a cluster of HIV-positive Haitians who seemed to fit no other risk category. AIDS became mistakenly known as the disease of the “four Hs” (homosexuals, heroin users, hemophiliacs, and Haitians), eventually leading to systematic discrimination against Haitians, including the hundreds of HIV-positive Haitian refugees who were shipped to the US naval base at Guantánamo Bay in Cuba, its inaugural use as a “no-rights” zone that later expanded for suspects linked to the events of 9/11 in the United States (Ratner 1998). HIV infection quickly spread among the impoverished Haitian population with prevalence at one point reaching 10.9 percent among pregnant women in a Port-au-Prince slum (Koenig et al. 2010).
But a strong partnership quickly arose in Haiti between local nonprofits and international partners. Haitian providers showed through key demonstration projects that ARV therapy could be delivered successfully in the poorest country in the hemisphere (Farmer et al., 2001), an important stimulus to ambitious treatment programs launched later. After building a successful community-based strategy for treating endemic tuberculosis in the country, health agencies could transition smoothly to HIV care based on a strong role for lay health educators known as accompagnateurs. Given that 40 percent of newly diagnosed HIV patients in Haiti presented with a concurrent tuberculosis diagnosis, the model was quickly adapted and extended, and Haiti built a remarkably successful HIV/AIDS prevention and care program. However, the role of LGBT advocates in the epidemic in Haiti was more marginal than elsewhere in Latin America given the predominant role of heterosexual transmission there, a trend closer to the African epidemiological pattern.

**Partnership with Health Authorities**

Some Latin American governments were quick to recognize the limits of traditional public-health approaches to the HIV/AIDS epidemic and embraced advocacy groups with a strong LGBT presence as collaborators in prevention efforts. Cooperation was encouraged by WHO, UNAIDS, and more recently the Global Fund, which wielded influence with health ministries in Latin America given the considerable resources available through them.
Where conservative governments resisted making LGBT groups into formal interlocutors, private foundation funds from entities in the United States and Europe would fill the gap and enable HIV/AIDS activists to sustain independent programs while monitoring the performance of the public sector. US charities such as the Ford Foundation and the Foundation for AIDS Research (amfAR), Netherlands and British development funds, German and Scandinavian church agencies, and the Elton John AIDS Foundation, among many others, provided crucial support in the early years. While most of the work was HIV-focused, the heavy LGBT presence in these groups made a degree of overlap inevitable. Many of the foreign agencies already had experience supporting human rights defenders and other nongovernmental sectors during the years of military rule. The US Centers for Disease Control and Prevention (CDC), USAID, and the World Bank also could leverage important donations for cooperative governments willing to work with the nongovernmental sector.

The logic of cooperation with LGBT-friendly organizations was compelling. With the epidemic heavily concentrated in the gay male population, peer education played a prominent role as groups developed their version of “safe-sex” workshops or encouraged condom use through social networks. The need for new approaches became clear because traditional public-health measures could backfire. Costa Rican health officials started to perform contact tracing in the early 1990s, as done for syphilis control, but found citizens furious at the potential breaches of privacy given the enormous stigma related to HIV as well as homosexuality. Cuba famously attempted to quarantine persons who acquired HIV infection from 1986 until 1994, at one point housing as many as ten thousand people. While the strategy was later abandoned as misguided, it drew cautious praise from conservatives who approved of the authoritarian approach and from others impressed by the favorable living conditions and medical care provided to residents.

Brazil played a special role given the historically progressive outlook of its public-health movement, which was prominent in the long struggle to end military rule there. Medical providers in São Paulo, the largest Brazilian city, promptly joined forces with LGBT leaders to promote a highly influential strategy involving community groups, academics, and the public-health apparatus, based on a human rights framework that permeated the popular discourse on HIV/AIDS worldwide. Nondiscrimination was fundamental to the strategy, including promoting sexual and gender diversity as essential rights. Brazil negotiated four quadrennial World Bank loans that injected hundreds of millions of dollars into the multifaceted program, boosting the prestige of the aforementioned “Brazilian model,” especially as the country defied predictions of a runaway epidemic rivaling the worst cases in Africa.

Cooperation with local LGBT-dominated nonprofits did not always coincide with a government’s political tendencies but rather often depended on the individual perspective of a health minister or key midlevel official. Nicaragua’s nonprofit sector had working
relations with the conservative governments in office from 1990 to 2006 and expected improvements when the Sandinista party returned to power given its revolutionary roots. But the Sandinistas proved hostile to the groups' independence and took drastic action against entities considered insufficiently loyal, such as the 2008 raid on eight nonprofits and the seizure of their computers accompanied by accusations of money laundering and spying for the United States (Human Rights Watch 2008). Brazil's nongovernmental sector flourished under the center-right government of Fernando Henrique Cardoso and the two terms of leftist Luiz Inácio Lula da Silva (popularly known as “Lula”) of the Partido dos Trabalhadores (PT; Workers Party), but they fell out of favor under Lula’s PT successor, Dilma Rousseff.

**Religion**

The role of religious belief and religious institutions in the HIV/AIDS epidemic and by extension the LGBT movement in Latin America is multilayered. Although Catholicism is the majority tradition in the continent, evangelical Protestant groups are growing rapidly and often are influential with ruling elites, such as the military hierarchy and business conservatives.

Church rejection of homosexuality was particularly painful for HIV-positive persons who felt close to their religious traditions and actively participated in liturgical ceremonies. At the same time, religious organizations were at the forefront of many initiatives to aid those suffering from HIV-related illness in a nonjudgmental spirit. Caritas-Chile, a Catholic organization, was among the first entities to support persons with AIDS in the late 1980s, sparking virulent opposition from neighborhoods where the group intended to establish supportive housing. Caritas did not engage in prevention activities that would have led it into sensitive areas, but it offered a potent example of nondiscriminatory aid consistent with Christian belief, explicitly reminding Chileans of Gospel parables in the same vein. Thus, when the first cases appeared on the continent, it was often clergy who found ways to offer succor to persons living with HIV. This religious presence affected media treatments, which usually offered a modicum of sympathy, despite their tabloid-style approach, especially when showcasing HIV-positive children or parents of AIDS sufferers.

Furthermore, Catholic institutions are extremely varied and represent distinct theological tendencies. While Opus Dei’s sympathizers in the media or educational institutions in countries such as Peru and Chile fought to forbid condom promotion, other Catholic groups, such as Guatemala’s Pastoral Juvenil (Youth Mission), included condom education in their prevention workshops. Congregations such as the Jesuits, Franciscans, and others not part of diocesan hierarchies often acted independently to support LGBT populations and their efforts, especially where the influence of liberation theology or a tradition of defending human rights from repressive governments remained strong (Murray et al. 2011).
Leaders of Chile's first AIDS prevention nonprofit experienced the ambiguities within Catholic institutions in addressing HIV/AIDS directly. While the church hierarchy disapproved of government educational campaigns pushing condom use, and some conservative bishops denounced them in no uncertain terms, MISEREOR, a Catholic development agency in Germany, offered the organization a small stipend on the condition that it obtain a local bishop's recommendation. During an early 1990s meeting to discuss the request, a church functionary bluntly asked who constituted the group and was reassured that it had no political party affiliation and was mostly composed of gay men. The endorsement letter followed a week later.

The gradual easing of the sense of emergency about AIDS given the availability of treatment in the late 1990s has weakened the nonprofit HIV sector and its LGBT allies, and church-based conservatives who had never accepted the liberalization of social attitudes toward sex stand ready to reverse these trends. For example, Brazil's sex-friendly educational campaigns long combined appeals to caution around HIV with affirmations of sexual diversity and freedom, including the defense of sex workers (Parker 1999). But, in 2013, the evangelical bloc in the national legislature denounced a “No Shame” prevention campaign aimed at Brazilian sex workers to be launched on National Prostitute Day. The liberal PT government, reliant on the support of the evangelical bloc, pulled the advertisements.

**Conclusions**

While LGBT issues enjoyed a major boost from HIV/AIDS activism, progress against the epidemic has slowed as the social movement that arose to face it has faded. Estimated prevalence among gay and other men who have sex with men has held steady at around 10 to 17 percent throughout the region for years, and new infections reportedly are on the rise among younger gay/bisexual men (UNAIDS 2017). While activists pushed governments successfully on ARV provision, there has been little pressure to install point-of-care HIV diagnostic tests that do not require a return clinic visit, a standard procedure in the developed world.

In summary, grassroots efforts, especially those involving charitable care and assistance to ill or destitute persons, usually escaped the ire of conservative religious authorities. But attempts to institutionalize liberalized notions about sex remain sharply contested. In large part, religious conservatives have been successful in keeping comprehensive secular sex education out of national school curricula or public institutions, and the lack of preparation for sexually active youth remains a huge challenge for the region.

HIV/AIDS nonprofits and the social movement that emerged around the epidemic are in a very different environment today from the grim emergency period of the 1980s and 1990s when those infected had few treatment options and quickly fell victim to the disease. The
focus shifted back to the clinical setting once governments in the region provided physicians with powerful pharmaceuticals. ARV coverage for diagnosed persons living with HIV in Latin America was 64 percent as of 2017, a respectable figure in comparison with the developed world (De Boni et al. 2014). However, the early emphasis on understanding human sexuality and engaging with “key populations” (intravenous drug users, sex workers, and men who have sex with men) faded, partially severing the links between the epidemic and LGBT issues. Now, not all LGBT advocates accept the historical association of their cause with the HIV epidemic. Organizers of the 2010 gay pride celebrations in Porto Alegre in the south of Brazil, for example, discouraged AIDS-focused groups from participating.

The Global Fund, a major player in supporting government treatment purchases and keeping the HIV/AIDS nonprofit sector alive, has announced its intentions to pull out of most Latin American countries where per capita income is considered adequate for governments to take over the burden directly. Transitional grants intended to facilitate the transfer of responsibility to the respective governments are now being executed in several countries. But a 2017 consultant report on Panama predicted that the withdrawal could be fatal to that country’s nonprofits, which are “unlikely [to] survive” (Richardson 2017, 3).

Moreover, epidemiological monitoring reveals a persistent, even growing, epidemic reminding policy makers of the complexities of delivering lifelong treatment for a chronic disease. Undetected cases, late diagnosis, incomplete linkage to the health-care system, poor treatment adherence, and failures of viral suppression are all crucial elements in keeping the incidence curve under control— even in resource-rich settings. While partnership rights are on the agenda in some countries and demands for inclusion gain greater acceptance, HIV continues to take its toll among young—and especially poorer—gay and bisexual men. HIV will affect the movement for LGBT civil and political rights in Latin America for a long time to come.

Meanwhile, LGBT activism today in Latin America has made enormous strides, in part due to the boost provided by the HIV epidemic. But the contrasts among countries remain vast. In 2008 Brazil’s president, Lula da Silva, inaugurated the I Conferência Nacional de Gays, Lésbicas, Bissexuais, Travestis e Transexuais (First National Conference of Gays, Lesbians, Bisexuals, Transgendered, and Transsexuals) with a keynote speech. In 2016 Buenos Aires authorities named a subway station for gay rights pioneer Carlos Jáuregui.

At the same time, the Inter-American Commission on Human Rights reported that 594 murders motivated by sexual orientation or gender expression occurred in the Western Hemisphere in a little over a year during the 2013 to 2014 period. Honduras has the unenviable distinction of being the most dangerous country in the hemisphere in general and for LGBT activism in particular, with many LGBT Hondurans forced into exile. Erick Martínez Ávila, a Honduran journalist and spokesperson for the LGBT group Asociación
Kukulcán (Kukulcán Association), was kidnapped by heavily armed men and assassinated in 2012. The murder remains unsolved.

BIBLIOGRAPHY

Richardson, Kataisee. “Transition Readiness Assessment Finds HIV CSOs Are Unlikely to
With 5 million infected people as of 2017, Asia has the second-largest continental population of people with HIV, after Africa (UNAIDS 2017). While most countries in Asia have an overall prevalence of around or below 0.5 percent, rates are as high as 30 percent in communities of men who have sex with men (MSM) in certain regions of South and Southeast Asia (SASEA) (van Griensven and de Lind van Wijngaarden 2010). Moreover, while rates of new infection dropped by 13 percent across Asia in 2016 (Avert 2017), they increased by as much as 60 percent in MSM communities in SASEA countries during the same period (van Griensven and de Lind van Wijngaarden 2010). Scholars of the epidemic point out that criminalization, social exclusion, stigma, lack of access to medication and interventions, exposure to risky environments, and substance use constitute a formidable set of challenges that have increased the vulnerability of MSM and transgender communities in this region (Cácares, Aggleton, and Galea 2008; S. Khan 2001).

Queer communities are embedded in cultural and legal environments that vary greatly across the region. (The use of the term queer here refers to the spectrum of gender- and sexually fluid communities subjected to categorization by the state, but whose lived experiences and political engagements often transgress those categories [Halperin 2008]). While countries like Bangladesh enforce strict legal bans on transgender communities and same-sex unions (S.I. Khan et al. 2009), Vietnam has no such legal restrictions in place (Horton, Rydstrøm, and Tonini 2015). India has witnessed recent legal battles around the ban on oral and anal sex, even while transgender (sometimes known as hijra) communities have enjoyed some level of visibility historically (S. Khan 2001; Misra 2009). In Thailand,
the transgender community has carved out a niche for itself in public life, but it continues to be stigmatized and rendered legally invisible (Jackson and Sullivan 2015).

With HIV initiatives increasingly focusing on sexually marginalized communities to stop the spread of the disease in the SASEA region, gay, transgender, and MSM communities have gained visibility as objects of intervention (Cácares, Aggleton, and Galea 2008; S. Khan 2001; Trapence et al. 2012). There is some question as to whether this attention has helped to animate a movement around sexuality in this region, as well as the question of whether state intervention has helped dismantle closets or instead has constructed new, segregated spaces for queer communities in SASEA countries. We examine these questions by reviewing the scholarship on HIV in this region, especially where queer communities enter the arena in the fight against the epidemic.

**Civil Society in the SASEA Region**

Unpacking the manner in which HIV initiatives have engaged with sexuality movements necessitates an examination of the role played by HIV/AIDS-related service organizations in the SASEA region. HIV scholars often (and perhaps loosely) refer to the field occupied by these service organizations as civil society (Trapence et al. 2012), assuming that these organizations enhance the voice and visibility of those they serve. The question remains, however, as to whether or not these organizations constitute a true civil society in the classical sense of the term, where the state responds to the needs and demands of the people. We explore this question further by interrogating the role of civil society in SASEA countries and the manner in which HIV service organizations operate in this type of space.

In the context of South Asia, conceptions of civil society have been concerned with the way inequality and poverty restrict access to civil society, as an associational space shaped by historically hierarchical familial and communitarian codes (Kaviraj 2001; Mahajan 1999).
Contemplating the different formulations of civil society that have emerged in the literature, Carolyn M. Elliott (2003) notes that in India arguments about civil society and its salience have focused on the extent to which it is able to extend democracy into the margins of society. She notes that political society—the space where claims are made and responded to by the state—is often not concurrent with a civil space that is inaccessible to most communities. Some commentators caution against the injection of political sensibilities into a civil society marked by democratic processes, worried about the possibility of illiberal and communal forces co-opting democratic apparatuses (Beteille 2003; Rudolph 2000; Varshney 2003). At times, civil society becomes the site for the implementation of state policies. Scholars studying civil society in Vietnam for instance, note that nongovernmental organizations (NGOs) are closely monitored by both the state and its extension, the Communist Party (Gray 1999; Kerkvliet 1995). Civil society in these forms is seldom removed from the monitoring or the dictates of the state.

Seeking to recover the political from engagements with the state, Partha Chatterjee (2008) argues that marginalized communities in India make their claims in political society, a space that is distinct from civil society.

The latter, he argues, influenced by the vectors of development and the logics of the market, has lost the possibility of being the site where people engage politically and productively with the state. Chatterjee notes that political society—where claims are staked out by the poor and responded to by the state—is distinct and separate from civil society. Tracking the forces that create political society, he describes the manner in which the state uses technologies of surveillance to identify populations marked by dimensions of deprivation and risk. Populations, in turn, organize strategically around these “need” categories, engaging the state by making claims around their identified areas of deprivation. Often, this type of political identification (on the part of the state) and claims-making (on the part of populations) culminates in accommodations by the state, whereby quasi-legal arrangements are agreed to, so that members of a particular population can continue to survive.

However, Chatterjee’s formulation also delineates some limiting conditions for political possibilities. The needs around which the engagement between state and the people occurs are basic and simplistic categories of deprivation, and do not appear to take into account the interweaving tapestry of disparity that marks people living on the margins. As a result of this, and the strategies deployed by people to fit into these categories, political society is a statistically created community rather than one enunciated by deeply shared experiences and communitarian bonds. Finally, Chatterjee warns that political victories are often ephemeral, disappearing with a change in government or a reversal of quasi-formal policies.

Chatterjee’s concept of political society presents a useful analytical tool to examine the way
in which mobilization around HIV needs helped the LGBT community in South and Southeast Asia organize around sexuality issues. We review the scholarship on HIV and sexuality in this region by tracing the statistical surveillance state as described by Chatterjee, and then examining the way communities identified by this process organized around sexuality.

**HIV/AIDS and Surveillance Society**

The state focus on managing HIV, as enunciated by Chatterjee and other scholars, is evident in the scholarship on surveillance of the epidemic. Epidemiological studies from Vietnam to Nepal have tracked the disease, identifying communities at risk, those that pose risk, and those that act as bridges that enable the disease to jump between populations. These “sentinel” programs described a disease that spread very quickly in the early 1990s.

**Identifying Communities at Risk** In India, scholars have noted that the epidemic resides in gay communities, cautioning readers on the risk of spread of the disease because of the shame and stigma surrounding living with HIV and the maladaptive ways in which gay men cope with it (Jethwani et al. 2014). Alcohol and injection drug use are consistently identified as further risk factors, increasing the likelihood of unsafe sex and use of unclean drug paraphernalia (Yadav et al. 2014; Shaw et al. 2016).

Alix Adrien and his colleagues (2013) describe the establishment in Pakistan of a groundbreaking surveillance system to track the epidemic, one that has identified some of the same risk communities as in India: MSM, injection drug users (IDUs), and sex workers (Altaf, Zahidie, and Agha 2012; Emmanuel et al. 2013b; Emmanuel 2013a; S. Singh et al. 2014). As in India, transmission of the disease has been ascribed to risky sex, risky communities (such as sex workers and IDUs), and risky sex with risky communities (unprotected sex with IDUs and sex workers) (Collumbien et al. 2009; Khanani et al. 2011). The surveillance system has allowed researchers to identify where some of these communities are geographically located: Muhammad R. Khanani and colleagues (2011) note, for instance, that one of the highest risk communities of MSM and IDUs can ironically be found around the original Mohenjo Daro excavation sites in Pakistan: humanity’s cradle of early civilization.

Similar surveillance systems in Bangladesh, Nepal, and Vietnam have identified the same communities as being at particular risk. While HIV rates are generally low nationally in Bangladesh and Nepal, prevalence is high in sex worker, IDU, and transgender communities (Oldenburg et al. 2016; Chan and Khan 2007; Deuba et al. 2013; Oli, Onta, and Dhakal 2012).

Thailand, the country with the highest HIV prevalence in Southeast Asia, set up a system in the early 1990s that tracked the rapid increase in HIV rates among sex workers and IDUs.
According to the national sentinel system, and records maintained by the army, almost 2 percent of women presenting for prenatal care and 4 percent of male army recruits were testing positive for HIV by the early 1990s (Rojanapithayakorn and Hanenberg 1996). The surveys identified certain geographical regions with an even greater burden of the disease: almost 13 percent of army recruits and 5 percent of pregnant women in urban areas were infected with HIV. Recent scholarship highlights populations at even higher risk: Almost 21 percent of young men (between the ages of eighteen and twenty-four) who have sex with men were HIV positive in a 2006–2014 study (Thienkrua et al. 2017).

In Vietnam, almost 18 percent of women-identified transgender people are infected (Bao et al. 2016), with prevalence as high as 33 percent in sex-worker communities (Tuan et al. 2008). Injecting drugs, selling sex, being twenty to forty years old, having fewer than six years of education, and having more than five male anal sex partners in the past month were associated with being HIV-infected. MSM who had ever married, were exclusively or frequently receptive, sometimes consumed alcohol before sex, and/or frequently used condoms during anal sex in the past three months were less likely to be infected with HIV. Recreational drug use is strongly associated with HIV infection among MSM in southern Vietnam (T. V. Nguyen et al. 2016).

The scholarship on risky communities indicates at times certain practices in communities of MSM that render them at greater risk for infection. In India, for instance, identifying as a kothi (a person who predominantly has anal receptive sex) is associated with significantly higher rates of infection (Ramanathan et al. 2014; Saha et al. 2015; Setia 2009; Yadav et al. 2014). Unmarried men are more likely to identify as kothis among men who have sex with men (Hemmige et al. 2011; Mayer et al. 2015) and are at greater risk than men who have sex with both men and women (Ramakrishnan 2015).

In contrast, women-identified transgender people in Thailand appear to be at slightly lower risk of infection, with an HIV prevalence of 9 percent compared to 16 percent among gay-identified men (Chariyalertsak et al. 2011). Similarly, receptive anal sex appears to be a protective factor with respect to HIV infection among MSM in Vietnam, possibly because they have higher rates of condom use during sex (T. A. Nguyen et al. 2007).

** Parsing Out Risk: “At” Risk and “Being” Risky ** In addition to identifying the gay and transgender community as being at-risk of infection, this scholarship identifies the factors that make these communities “risky” in terms of their potential to transmit the disease to others. Studying the community of MSM in Nepal, Keshab Deuba and his coauthors (2013) note that the absence of condom use was significantly associated with nonparticipation in HIV interventions, experience of physical and sexual violence, depression, repeated suicidal thoughts, a small social support network, and dissatisfaction with social support. In Vietnam, mental illness and alcohol use are associated with transgender people not getting tested for HIV (Bao 2016). These psychosocial variables and behaviors are identified as
factors fueling the spread of the epidemic.

A considerable portion of the scholarship on transmission of the disease focuses on “bridge” populations: groups of HIV-infected people who act as vectors of transmission from one community to another. At times, this entails the physical transport of the disease across geographical areas. Studying the way the disease has spread in Pakistan, Jan Willem de Lind van Wijngaarden and Bettina T. Schunter (2014) identify truck routes as highways for the disease itself, with young men who serve as assistants to truck drivers being engaged as sex workers traveling these routes. The authors note that these young men, often coerced into sex with male drivers initially, are highly vulnerable to the infection and at risk of spreading it. Similarly, in Bangladesh, Akm Masud Rana and coauthors (2016) identify cross-border mobility among sex workers as a way in which the infection is transported across countries.

Other bridging acts highlighted in the surveillance literature involve those who have sex with different communities simultaneously. In India, scholars have documented the manner in which bisexual men connect MSM and women, transporting the infection from one community to the other (Godbole et al. 2014; Ramakrishnan et al. 2015). Martine Collumbien and her coauthors (2009) note that in Pakistan, MSM who are married to women and also have sex with male IDUs who are infected are responsible for the spread of the infection between these two populations. In Nepal, almost a third of men under the age of twenty who have sex with men also have multiple women sexual partners (S. K. Singh et al. 2013), while in Vietnam the same proportion of MSM report having sex with women partners (Garcia et al. 2014).

The surveillance regime described above adheres to the tenets of the initial stages of Chatterjee’s political society. The question remains as to whether states and HIV agencies in the SASEA region complete the configuration by negotiating around basic survival needs when they engage with these risk group categories. Moreover, as they do so, the crucial question that emerges is whether these negotiations open the door for a voice and a substantive social movement for LGBT communities.

Deepening Democracy through HIV Service Organizations

Proponents of the view that NGOs in civil society help to deepen democracy and inclusion point to the support these agencies have received to engage in precisely this process from institutions such as the World Health Organization (WHO), the World Bank, the United Nations (UN), and the US government. Enunciating the effective manner in which this has happened in the HIV/AIDS field, Gift Trapence and his coauthors (2012) note that the WHO issued guidelines that “health services should be made inclusive of MSM and transgender people, based on the principles of medical ethics and the right to health.” Similarly, the World Bank and President’s Emergency Plan for AIDS Relief (PEPFAR), the US
government’s initiative to battle the epidemic globally, have issued important stipulations to include local organizations of MSM in HIV intervention efforts (Beyrer et al. 2011; PEPFAR 2011). Trapence and his coauthors (2012) note that the Global Fund to Fight AIDS, Tuberculosis, and Malaria, the initiative of Western governments to fight infectious diseases in the Global South, stipulates the enunciation of the role of community-based organizations in proposals submitted by countries (see also Csete 2011).

Trapence and his coauthors (2012) argue that these state-led initiatives, with muscular support from institutions of the Global North, have helped to cement the role of community-based agencies that work with gay and transgender communities. In India, for instance, they note that an organization called Pehchan (or “recognition”) is working with seventeen state governments to develop 200 community-based organizations to provide HIV services to 453,000 members of the MSM and transgender communities. Similarly, the Avahan initiative, a partnership between the Bill and Melinda Gates Foundation and the Indian government, utilized peers from at-risk communities to engage people around safe-sex practices (Ramanathan et al. 2014). In Maharashtra, one of the states in India with the highest prevalence of HIV, especially in MSM and transgender communities, the initiative was able to showcase the effectiveness of utilizing community members by reaching 90 percent of the community and significantly raising the frequency of condom use during sex. In recent years, this state-based approach has been supplemented by some of the top companies in the corporate sector allocating funds to support HIV initiatives under the banner of engaging in corporate social responsibility (Gautam and Singh 2010).

Partnerships between the state and local organizations allowed organizations working with gay communities to gain a voice in Nepal and the Philippines. The Blue Diamond Society gained prominence for protesting discriminatory state practices against LGBT communities in Nepal, while in the Philippines the TLF Sexuality, Health, and Rights Educators Collective helped to extend HIV services to sexual minority communities (Trapence et al. 2012). At times however, even highly effective HIV programs initiated by the state appear to have no effect on queer rights in a country. Thailand’s “100% condom use” program has been touted as a model state intervention that has effectively engaged a wide range of vulnerable communities in the country (Rojanapithayakorn and Hanenberg 1996). However, Peter A. Jackson and Gerard Sullivan (2015) note that, despite enjoying a fair measure of visibility and tolerance in Thai culture, transgender and MSM communities have no sociopolitical standing and are systematically segregated into exoticized and therefore “othered” spaces.

Interventions like the ones described above, implemented as they are by governments, mark a type of civil society that develops out of support from the state and international entities such as the UN and the World Bank. Nancy L. Rosenblum (2003) notes that this is a particularly statist brand of civil society, with NGOs becoming instruments of the state, and she wonders to what extent it is actually inclusive of communities living on the margins. In
order to shed further light on the way queer voices emerge in the encounter between the
state and medically at-risk communities, we examine more closely, the trajectory of HIV
management in two countries: Vietnam and India.

**HIV Management and Queer Mobilization in Vietnam** The lineage of civil society
institutions in Vietnam traces back to French colonial times, when the government sought
to curb anticolonial mobilization by allowing only monitored associations to establish
themselves. Postindependence, the communist state sought to make these associations a
central mechanism of engagement with the public. Encouraged by the state, NGOs
proliferated and were well supported by the government, as long as they were officially
registered. Whereas undesired social practices were made public and brought into the
ambit of the law in India, in Vietnam they were indicted as corrupt influences infiltrating
from foreign (and presumably capitalist) sources (Horton, Rydstrøm, and Tonini 2015).
Tarnished ideologically as corrupt social evils and relegated to spaces extraneous to that
inhabited by the state and society, practices such as men having sex with men did not need
to be combatted through law. However, the Vietnamese state's emergent efforts to manage
these practices look strikingly similar to those in India. As predicted by Chatterjee (2008),
there is an intense level of statistical surveillance to identify “at-risk,” “risky,” and “bridge”
populations, as described in the previous section. International agencies and NGOs funded
by the government engage with these populations, seeking to reduce behaviors that are
deemed to be risky. In the course of these initiatives, a community of MSM starts to emerge
into visibility, but only as subjects of HIV management.

Paul Horton, Helle Rydstrøm, and Maria Tonini (2015) note that organizations engaging
with issues of sexuality had to strategically fit into this management regime, simplifying
identities in order to shoehorn themselves into HIV-focused agencies working with
gayidentified “risky” populations. Alternatively, LGBT collectives and associations had to
link themselves to registered NGOs working on HIV, subject to that agency's stipulations in
order to share in resources. Both formulations have had a constraining effect on the
potential emergence of a true sexuality movement focused on the complex issues and rights
of a sexual minority community.

**HIV Management and Social Movements in India** The intersection of HIV care and the
fight for rights for sexually marginalized communities came to a head in India around the
movement to resist Section 377 of the Indian Penal Code. A statute brought forward from
colonial times, Section 377 sought to impose Victorian values by criminalizing “carnal acts
against the order of nature.” Scholars note that lesbian, gay, bisexual, and transgender
communities, as well as sex workers, were disproportionately targeted by the act over the
years prior to the Indian Supreme Court ruling that it could no longer be used to prosecute
same-sex sexual activity. (Misra 2009; Kotiswaran 2011). In essence, the statute created
two types of sexual acts: those that are left unmonitored, and those that are brought out of
the privacy of the home and under the purview of the law. In this, Section 377 enunciated a
juridical process established by the British in India: “making public” certain acts in order to monitor them (Chatterjee 2013; Kotiswaran 2011), while creating exceptions for other acts that were left untouched in the realm of the private. Such a distinction left actually violent acts, such as domestic battery and domestic rape, undismantled. However, in targeting the LGBT community as criminal subjects, Section 377 eventually clashed with the surveillance goals of another intervention: the need to manage the HIV-related risk behaviors of men who had sex with men.

In 1992, animated by the threat of the HIV epidemic, the Indian government established the National AIDS Control Organization (NACO), the department charged with fighting the epidemic (Horton, Rydstrøm, and Tonini 2015). In 1999, fueled by funding from the UN and other international NGOs, the government embarked on a national program to intervene in the activities of some high-risk groups identified in the surveillance systems discussed in the previous section. This was a time marked by a profusion of HIV-related NGOs that sprang up all over the country to engage with communities at risk of HIV infection. It bears noting that the tradition of NGOs engaging with local populations traces back to colonial times in India, with the British government maintaining control over these organizations through mandated registering and monitoring procedures. Current governance in the postcolonial Indian nation-state has continued to rely on registered local agencies to engage with populations in need. In this, we see Chatterjee's (2008) notion of governmentality enunciating the way the state engages with the community.

Around this time, Naz Foundation International, a British-based (and British-funded) NGO, started targeting HIV risk among MSM in India (S. Khan 2001; Misra 2009). Fueled by the surveillance data that demonstrated the vulnerability of the MSM community, Naz was setting up various posts in Delhi and other parts of the country to distribute condoms and engage MSM in the fight against the epidemic. In 2001 Naz staff members who were working in concert with the state AIDS agency to engage MSM were arrested for running a gay sex club, in contravention of Section 377. The arrests sparked nationwide protests, fueling the fight against Section 377. Rejuvenating a legal initiative that had faltered, Naz teamed up with a legal agency called the Lawyers Collective to file a petition against 377 on behalf of the LGBT community, arguing that it violated the right to equality, to be free of sex discrimination, to fundamental liberties, and to life and privacy (Puri 2009). In September 2018 the Indian Supreme Court struck down the criminalization of same-sex sexual activity under Section 377.

Around the same time that Naz was mobilizing to engage the MSM community in the mid-1990s, the surveillance strategies identified in the previous section had uncovered another risky community: sex workers, or prostitutes as they were commonly referred to at the time. In Calcutta (now Kolkata), the state health department engaged women sex workers in Sonagachi, one of Asia’s largest red-light districts, to collaborate on an educational project to reduce risky sex (Basu et al. 2004). Soon thereafter, the sex workers formed the
Durbar Mahila Samanwaya Committee (DMSC), a collective that engaged the state around other issues pertinent to the community. In time, DMSC became one of the world’s leading voices in the movement to decriminalize sex work. Arguing that sex work is legitimate labor, DMSC established its own microbanking cooperative, primary health-care and legal aid services, schools for the children in the community, and a printing press (Ghose et al. 2008). Counting 65,000 members as part of its union, DMSC was appointed to a committee to protect the rights of sex workers by the Indian Supreme Court in 2011 (Ghose 2012). It has since extended its advocacy to include other marginalized people, including the LGBT community. In 2016 DMSC established an LGBT parliament that brought together sexual minority groups from across the spectrum and across the state of West Bengal. Given its prominence in the national and international spheres, DMSC’s advocacy has the potential to transform the political environment surrounding sexuality in India.

**Assessing the Statist Brand of HIV Intervention in SASEA**

The surveillance machinery that was activated by the HIV epidemic identified various risk communities in SASEA countries. They were remarkably similar across the region, and turned the spotlight—in some cases for the first time—on queer communities. As Chatterjee (2008) notes, this was the first step in creating a space for political society—one where queer communities were engaged with the state. This essay identifies three types of engagement that developed from that initial encounter: a statist intervention narrowly focused on managing the HIV epidemic; an intervention program that identifies categories of need, which allows sexuality to strategically (if narrowly) enter the conversation; and finally, an intervention environment that is powerfully utilized by queer social movements to transcend the boundaries of political society and shape the institutions of civil society.

The Thai “100% condom use” program and the Avahan initiative in India are perhaps the best examples of the statist brand of HIV intervention. While enjoying comprehensive coverage, and at times targeting high-risk transgender communities, there is no room for local NGOs to mobilize around sexuality. State funding for these initiatives has not been channeled into human rights–based movements as outgrowths of the original initiative. While future research needs to unpack this process, we speculate that such a single-minded focus is a result of heightened involvement of the state and strict monitoring of the HIV programs.

In certain parts of the SASEA region, HIV initiatives have incorporated community-based organizations and given them more leeway to operate around the management of the epidemic. This has allowed MSM- and transgender-based service organizations to turn the spotlight on issues of sexuality and human rights. HIV management programs in Vietnam are the prime example of this process, with funding being siphoned off to sexuality-based organizations that strategically position themselves in the disease-management regime. This maneuvering of the medical initiative process has even allowed queer communities in
very repressive environments like Pakistan and Bangladesh to gain some measure of foothold in the national consciousness, putting them in the line to receive services from the state. In certain situations, the nuanced gender and sexuality differences within queer communities have gained attention, making visible such communities as the kothi and hijra in India, the meti in Nepal, the kathoey in Thailand, and the bakla and badin in the Philippines.

This second strand of HIV initiatives that subsequently allow queer communities to mobilize around sexuality is a classic example of Chatterjee's (2008) political society. Risk communities are statistically identified by the state, allowing transgender and MSM populations to be invited to the table in risk-management efforts. These populations then strategically utilize this visibility to add claims around sexuality rights into the equation. At times, political society is effective in establishing the legitimacy and visibility of queer groups to the state, at the least, persuading it to turn a blind eye to previously criminalized sexual acts.

For all its effectiveness though, these strategies are constrained by the same boundaries that rein in political society: They demand a shoehorning of complex sexual identities into simplistic categories, with victories being temporary and dependent on vanguard organizations paving the way (Horton, Rydstrøm, and Tonini 2015). Moreover, cisgendered (identified as female at birth) lesbian women almost never get a voice in these political accommodations, since they are seldom the focus of HIV risk-management efforts.

The final trajectory of the development of HIV management efforts holds out some promise for a full-blown social movement being animated by state initiatives. Naz and DMSC started out in classical political society in India and then skipped over the wall, keeping the political away from institutional civil society. Both these collectives were able to transcend the limiting conditions of political society and are reshaping the laws and policies around sexuality in the country. While future research needs to delve into these processes, we call attention to the strategic manner in which these organizations became what Ashutosh Varshney (2003) describes as civically integrated organizations, bringing together queer communities (and their complex issues) with those targeted by state management efforts. If they continue to be successful “civic bridges,” avoiding the pitfall of becoming oppressive or co-opted regimes in their new capacity as vanguard organizations, they will continue to uncover effective strategies to mobilize around sexuality.

**BIBLIOGRAPHY**

Chatterjee, Partha. “Lineages of Political Society.” In *Comparative Political Thought:

Doctors first recognized AIDS as a cluster of rare infections among gay men in the summer of 1981. These men lived in cities such as New York, San Francisco, and Los Angeles, which had large gay communities. Many were young and otherwise apparently healthy, so doctors were confused when they showed up in the hospital with infections that usually affect people with compromised immune systems. These were the first cases in an as-yet-unnamed epidemic, which would be referred to as GRID (gay-related immunodeficiency) before the Centers for Disease Control settled on the name AIDS (acquired immunodeficiency syndrome) in 1982. By 2016 the disease had claimed 35 million lives worldwide, and another 36.7 million were living with HIV, the retrovirus that causes AIDS.

The epidemic has affected various LGBTQ groups differently. Gay and bisexual men, transgender women, and intravenous drug users have been hit the hardest by HIV/AIDS. Bisexual men have furthermore been stigmatized as the source of a possible widespread outbreak among heterosexuals. On the whole, lesbians experience relatively low rates of HIV infection but serve as caretakers for infected gay friends. Black, Latino, and poor LGBTQ people have also been affected by HIV/AIDS at greater rates than their white counterparts.

AIDS nearly wiped out an entire generation of gay and bisexual men and transgender women, robbing the LGBTQ rights movement of vital and challenging voices. At the same time, AIDS brought a new cohort of gay activists “out of the closets and into the streets” ([Queer Resources Directory 1994](https://www.queerresourcesdirectory.com)). The advent of a deadly sexually transmitted disease seemed to spell the end of gay liberation but also engendered a new gay sexual ethic. AIDS exposed widespread enmity toward gay life but also aroused popular sympathy for the sick and dying. The epidemic resulted in laws that limited the freedom of HIV-positive people but also arguably fueled public acceptance of gays and lesbians, leading to widespread support for openly gay military service and same-sex marriage.

**Early Responses**
In the early years of the epidemic, medical researchers worked to find the cause of AIDS and to map its spread. However, little public money was available for education and prevention programs in the communities most affected. The onset of the epidemic followed closely on the election of Ronald Reagan as president in 1980, and conservative players in the new administration opposed any response to AIDS that condoned sex outside of marriage, much less sex between gay men. The lack of an effective federal response to the epidemic shaped grassroots responses to the disease and in later years would fuel the growth of a direct-action AIDS movement.

**AIDS Service Organizations** As more and more cases of the mysterious new disease emerged, gay men created their own organizations to confront the growing crisis. In some cities they formed entirely new groups, such as the San Francisco AIDS Foundation and Gay Men’s Health Crisis in New York City. Elsewhere they worked through existing gay and lesbian health groups, such as Philadelphia Community Health Alternatives and the Whitman-Walker Clinic in Washington, DC.

These groups educated local gay communities about the new disease. Many groups established AIDS hotlines to answer questions, distributed condoms and educational literature to gay bars, and designed ad campaigns to encourage safe sex. They also brought comfort and assistance to the sick. People with AIDS faced the loss of independence and financial ruin, as the disease left many unable to work and care for themselves. AIDS organizations thus established “buddy” programs that paired people with AIDS with volunteers who could help with basic chores while offering friendship and emotional support. Some groups also offered small grants to help people with AIDS pay medical or utility bills, and others established housing facilities where people with AIDS could find shelter and receive medical care.

While the first AIDS service organizations began as grassroots efforts to confront a new and terrifying disease, they soon grew into large nonprofit groups with paid staff, outside funding, and contracts with local and state governments. By the mid-1980s these groups began to draw criticism for their alleged reluctance to upset major funders by challenging the political status quo. As the demographics of the epidemic shifted toward communities of color and the poor, established AIDS organizations also came under fire for their orientation toward predominantly white and well-off gay communities.

**Safe Sex** The onset of the AIDS epidemic sparked a contentious debate within gay communities about their sexual culture. In the early days of the crisis, no one knew what caused the disease or how it was transmitted, but the exchange of bodily fluids during sex seemed to play a role. Some, such as the writer and Gay Men’s Health Crisis cofounder Larry Kramer (1935–), saw the epidemic as the result of the sexual excesses of the 1970s. He warned that if gay men did not significantly curtail their sex lives, they could be wiped out altogether. Others accused men such as Kramer of playing into the conservative
argument that AIDS was a punishment for gay men’s sinful lifestyles.

Some looked for ways that gay men could reduce their risk of getting sick while continuing to have sex. In 1983 Richard Berkowitz (1955–) and Michael Callen (1955–1993) published their booklet *How to Have Sex in an Epidemic*, in which they advised gay men on how to alter their sexual practices in order to reduce their risk of contracting AIDS. Among other things, they advised gay men to use condoms during intercourse, limit their number of sexual partners, and form “jerk-off clubs” where men could masturbate together without exchanging bodily fluids.

AIDS also took a toll on the health of gay men who did not exhibit symptoms. Researchers and service providers referred to them as the “worried well”—otherwise healthy men suffering from anxiety and grief because of the epidemic. For some, antigay stigma surrounding the epidemic dredged up feelings of shame and internalized homophobia. Others felt isolated by the end of the public sexual culture, as well as the loss of scores of friends.

In response, in the mid-1980s Michael Shernoff (1951–2008) and Luis Palacios-Jiménez (1952–1989) developed “Hot, Horny and Healthy!,” a workshop to help gay men work through their sense of loss while learning safe-sex techniques. They took a sex-positive approach, emphasizing that different sexual practices carried different levels of risk for HIV transmission. Shernoff claimed to have presented the workshop to tens of thousands of men across North America. “Hot, Horny and Healthy!” was also adapted for specific use with gay men of color by Phill Wilson (1956–) for the National Task Force on AIDS Prevention. Such programs, however, drew the ire of conservatives such as the Republican senator Jesse Helms (1921–2008), who opposed the use of federal funds for programs that would “promote, encourage, and condone homosexual sexual activities” (quoted in Petro 2015, 74).

**Self-Determination** People with AIDS also fought to determine how the disease was talked about and treated. The movement for self-determination began simultaneously in New York and San Francisco but crystallized at the Second National AIDS Forum, held in Denver in 1983. There, activists, including Callen and San Francisco nurse Bobbi Campbell (1952–1984), met in a hotel suite to discuss their concerns. They produced the Denver Principles, a set of demands for the treatment of people with AIDS.

These principles owed much to the feminist health movement of the 1970s. They rejected the labels “victim” and “patient,” which suggested “passivity, helplessness, and dependence upon the care of others,” in favor of “people with AIDS” (Advisory Committee of People with AIDS 1983). They also set forth recommendations for compassionate medical treatment and encouraged people with AIDS to become their own advocates in dealing with the media and AIDS service groups.
Upon returning home Callen, Campbell, and others formed the National Association of People with AIDS (NAPWA) to advocate for the empowerment of HIV positive people. They took their slogan, “Fighting for Our Lives,” from a banner carried during the first candlelight vigil for AIDS in San Francisco. The Denver Principles influenced later AIDS activism, including demands by the AIDS Coalition to Unleash Power (ACT UP) for greater involvement of people with AIDS in HIV research. Although the NAPWA shut down in 2013 on account of bankruptcy, the Denver Principles continue to guide AIDS activists and policy makers.

**AIDS and Civil Liberties**

AIDS engendered a political crisis, as well as a medical one. While gay activists pressed for a federal response geared toward research, education, and prevention, their opponents pressed for very different forms of governmental action, including quarantine, criminalization, and censorship. This, combined with the conservatism of the Reagan administration, raised fears of a widespread crackdown on gay civil liberties.

**Bathhouse Closures** Early on in the AIDS crisis, policy makers and gay leaders alike focused their attention on bathhouses, commercial establishments where men went to have sex with other men. They debated whether these establishments should be regulated or closed down altogether. For gay activists, the fight over bathhouses raised questions about the future of the gay community. Advocates for closure pointed to the growing numbers of sick and dying and argued that gay men were putting “careless sex” ahead of collective survival. Their opponents defended the baths as a key part of the sexually liberated gay culture that had emerged during the 1970s. In their view, closure would betray gains made in the fight for gay cultural autonomy.

The bathhouse issue also raised questions about the balance between public health and civil liberties. In the middle decades of the twentieth century, the US Supreme Court had enshrined the right to privacy through a series of landmark decisions. Did that right extend to commercial establishments where people engaged in intimate behavior? Some public health officials and gay activists argued that it did and that regulating the bathhouses would invite further state intervention in gay men’s private lives. Some of those who advocated closure were also wary of state power and instead advocated for voluntary self-regulation.

Local officials tried to close at least some establishments. After being initially opposed to closure, Mervyn Silverman, San Francisco’s director of health, decided to shut down the city’s baths in 1984. His decision was rejected by a local judge, who allowed the baths to remain open but required them to educate patrons about safe sex. In contrast, the New York Supreme Court upheld New York City’s decision to close the New St. Marks Baths in Manhattan.
The Threat of Quarantine Some also worried that people showing AIDS symptoms would be isolated under the aegis of public health. Such fears were not mere fantasy. In 1986 California voters considered a proposal that would have empowered health authorities to quarantine people with HIV and AIDS. The ballot measure ultimately failed but only after an expensive and high-profile campaign. In addition, polling at times showed widespread public support for the isolation of people with AIDS, as well as other repressive measures.

Such proposals, combined with the growing number of deaths from AIDS, invited comparisons between the conservative response to the epidemic and the Holocaust. AIDS activists seized on the parallels. In 1987 a group of New York artists plastered the city with posters featuring a pink triangle, which authorities in Nazi Germany had used to identify gay men, and the words “Silence = Death” in white block letters. The posters warned that political apathy might lead to the mass imprisonment of people with AIDS and that government inaction on the disease constituted genocide.

PHOTO COURTESY OF SIGNIFYIN' WORKS

Marlon Riggs (front) with the Cast of Tongues Untied (1989). Filmmaker Marlon Riggs explored the impact of AIDS on black gay men in his documentary Tongues Untied.

The New York chapter of ACT UP, which would adopt “Silence = Death” as a movement image, dramatized these arguments with their float in the 1987 New York City Gay/Lesbian
Pride Parade. Members rode on a truck made up to look like a concentration camp, with barbed wire and marchers dressed as prison guards. Some AIDS activists objected to this use of Holocaust imagery, but the group’s theatrical tactics proved effective at drawing attention to the crisis.

**HIV Criminalization** Many states have passed laws criminalizing HIV transmission. These laws remain on the books even though the science of HIV prevention and treatment has evolved significantly. Public health professionals also argue that these laws increase HIV stigma, making people less likely to seek out testing and treatment.

Laws that criminalize HIV exposure and transmission vary from state to state. Some impose harsher penalties for certain crimes if the person convicted is HIV positive. Others specifically criminalize *intentional* exposure of another person to HIV or make it illegal merely not to disclose one’s HIV-positive status before having sex or sharing needles. A significant number of people have also been convicted under HIV criminalization laws for actions—such as biting or spitting—that carry virtually no risk of HIV transmission.

People of color, gay and bisexual men, and transgender women are overrepresented among people with HIV and are also disproportionately affected by HIV criminalization. Studies suggest, however, that racial biases exacerbate the impact of such laws. Blacks and Latinos are more likely to come into contact with the criminal justice system because of their HIV status, and they receive significantly harsher sentences under HIV criminalization statutes than their white counterparts.

**Art and Censorship** The art world was especially affected by AIDS, and gay artists such as Keith Haring (1958–1990) and Félix González-Torres (1957–1996) created arresting responses to the epidemic. However, as with Helms’s antipathy toward sexually explicit AIDS prevention, this work drew criticism from conservatives who objected to the use of federal funds to support “obscene” art.

David Wojnarowicz (1954–1992), who died of AIDS complications, used art to explore the devastation of the epidemic, as well as his own illness. His work first drew the attention of social conservatives in the late 1980s as part of the broader “culture wars.” Wojnarowicz’s use of a crucifix in the short film *A Fire in My Belly* again sparked an outcry in 2010 when it was included in an exhibit at the National Portrait Gallery. In response, the museum’s curator removed the work from the exhibit.

Similarly, the documentary filmmaker Marlon Riggs (1957–1994) explored the impact of AIDS on black gay men in his 1989 film *Tongues Untied*. When the sexually explicit film aired on the Public Broadcasting Service series *P.O.V.*, some local affiliates declined to show it. Republicans in the US Congress also criticized the National Endowment for the Arts, which funded the series, for having awarded Riggs a $5,000 grant. Riggs died from AIDS
complications in 1994.

AIDS and Communities of Color

By the mid-1980s it was becoming clear that AIDS disproportionately affected people of color, and especially minority gay and bisexual men. However, the first AIDS service organizations had emerged from urban gay communities in which racial discrimination was common. For this reason, gay and bisexual men of color were often suspicious of existing AIDS groups. At the same time, the disease was also spreading among heterosexuals of color, many of whom were unwilling to seek out services from organizations identified with gay men. As established AIDS groups struggled to connect their prevention efforts to communities of color, minority activists formed their own service and advocacy organizations.

Challenges to Existing Groups The first AIDS service organizations arose from communities of predominantly white gay men. As such, they tended to have white staff and volunteers and a largely white clientele. This reinforced the idea, prevalent among people of color, that AIDS was a “white gay disease.” However, reports from as early as 1983 showed that AIDS disproportionately affected people of color, especially Latinos and African Americans. In response, minority activists pressured existing AIDS groups to diversify their staff and volunteers and to design culturally specific programs that would speak directly to communities of color.

Many established AIDS organizations developed such programs, but critics argued that they were underfunded or inappropriate for minority communities. They pointed out that programs designed for white gay men would be ineffective at reaching gay men of color, who might hold different attitudes about sex and frequent different social spaces than their white counterparts. Moreover, activists argued, minority women and children would not be reached by programs designed for gay men.

Meanwhile, some staff and volunteers within existing AIDS groups criticized minority outreach efforts for very different reasons. They saw sexuality, not race, as the chief factor that put people at risk for AIDS and feared that developing new programs would dilute their efforts. This resistance further complicated outreach to minority communities, who saw it as evidence of white gay men’s unwillingness to grapple with their own racial prejudice.

Minority AIDS Organizations Minority activists also started new organizations to bring information about the disease to communities of color. Some groups operated locally, whereas others worked on a national scale. Some directed their efforts toward specific minority communities, whereas others advocated for the needs of nonwhite people as a whole.
Groups such as the Minority AIDS Project in Los Angeles, Kupona Network in Chicago, and the Gay Asian Pacific Alliance in San Francisco worked to provide minority AIDS services and education at the local level. Kupona Network offered AIDS outreach to African Americans irrespective of gender or sexuality, whereas the Gay Asian Pacific Alliance focused its HIV prevention efforts on gay and bisexual men of Asian descent. By contrast, the Minority AIDS Project offered AIDS services to a cross-section of local black and Latino communities.

Working at the national level were such groups as the National Minority AIDS Council (NMAC). Since its founding in 1987, the NMAC has lobbied for funding for AIDS programs geared toward communities of color, offered training and technical assistance to AIDS groups across the country, and promoted AIDS awareness. Since 1997, the NMAC has also sponsored the United States Conference on AIDS, which brings together AIDS activists, researchers, and service providers to discuss the latest developments in HIV science and prevention.

**Ballroom Prevention** Since the beginning of the epidemic, people with AIDS have also been cared for by friends and family members outside of the formal systems set up by AIDS service organizations. This is perhaps especially true for people of color, who are less likely to have access to health care. Many people with AIDS—especially those who are gay, bisexual, or transgender—also have faced rejection from biological family members and instead rely on "chosen" kin.

The ballroom community is one place in which queer people of color have banded together for mutual support. They are largely black and Latino gay and bisexual men and transgender women, who are at highest risk of HIV infection. The ballroom community in any given place consists of multiple houses where members participate in elaborate stage shows ("balls") as they compete to see who can best embody any of a number of categories, such as "Butch Queen" and "Executive Realness." Houses also take on the structure and function of families. House members help to care for each other, providing food and shelter, as well as advice about safer sex and HIV treatment.

Some public health departments and AIDS service organizations have worked with the ballroom community to use balls as sites for HIV prevention and education. Since 1991, Gay Men's Health Crisis has staged the Latex Ball, which promotes condom use. Attendees can compete in the ball's categories, get tested for HIV, pick up some condoms, and learn about AIDS services. Such balls exist alongside the more informal networks of support that the ballroom community provides to its own.

**Treatment Activism**

People with AIDS took an active role in shaping knowledge about the disease. Many
transformed themselves into activist-experts by learning as much as they could about the
disease and by asserting their right to speak about issues of AIDS research and treatment.
In this way, they ushered in a new model of disease activism.

**Treatment and Autonomy** As the number of people diagnosed with AIDS grew, those
affected became increasingly anxious for treatment. With drugs to treat the disease
unavailable in the United States, people with AIDS took matters into their own hands. Some
began to smuggle unapproved drugs such as ribavirin and isoprinosine into the country for
distribution through “buyers clubs,” which sold contraband remedies to people with AIDS.
Others traveled abroad in search of treatment. Among these was the closeted Hollywood
actor Rock Hudson (1925–1985), who flew to Paris in July 1985 to be treated with the
experimental drug HPA-23.

In addition to medications, AIDS activists exchanged information about the disease. In 1986
San Francisco resident John S. James began publishing *AIDS Treatment News*, first as a
column in the *San Francisco Sentinel*, and later as an independent newsletter. James’s
newsletter compiled information from numerous sources and became an invaluable
resource for both people with AIDS and their doctors. Similarly, the Philadelphia AIDS
activist Kiyoshi Kuromiya (1943–2000) founded Critical Path, an advocacy group that
distributed information about AIDS treatments, as well as support groups and service
providers. As a member of ACT UP–Philadelphia, Kuromiya also helped create the first set
of guidelines for the treatment of HIV that was written by people living with AIDS.

---

ACT UP Poster “Enjoy AZT” (1993). Playing off advertisements for Coke, this poster associates the
HIV/AIDS drug AZT with big-business profits, suggesting that other drug treatments for HIV/AIDS are being
deliberately delayed so the makers of AZT can increase their profits.

By seeking out experimental drugs, people with AIDS claimed the right to determine their own course of treatment. They reasoned that, because they were already dying, they should be allowed to decide for themselves whether or not to try out untested treatments, even if they risked their own health in doing so. In the spirit of the Denver Principles, they insisted on the right of people with AIDS to "make informed decisions about their lives," including choices about their medical care.

Clinical Trials Activists also sought to change the process by which medicines to treat AIDS were tested and approved in the United States. Groups such as ACT UP pushed for more “drugs into bodies,” and in October 1988 protesters gathered outside the headquarters of the Food and Drug Administration (FDA) in Rockville, Maryland, to demand that the agency speed up its drug approval process. Weeks later, FDA officials announced changes that would bring new medicines to market more quickly. This effort brought AIDS activists into an unlikely alliance with conservative politicians who favored deregulation of the pharmaceutical industry.

AIDS activists also intervened in the testing of new AIDS drugs. They objected to the use of placebos in AIDS clinical trials, which they saw as the inhumane denial of treatment to people who were already near death. Activists also sought to open up trials to more women and people of color, as well as to those who had been excluded from enrollment because of abnormal lab results or because they had previously been on medications that might confound research data. Moreover, they sought a “parallel track” structure for AIDS clinical trials, by which people with AIDS outside of controlled studies could get access to experimental treatments still under review.

While activists pushed for—and won—such changes at the federal agencies that oversaw the testing and approval of AIDS drugs, some took it upon themselves to conduct their own research. Groups such as Project Inform in San Francisco and Community Research Initiative in Boston provided information from their own community-based clinical trials to the FDA, which used the data to make decisions about the safety and efficacy of experimental drugs. In this way, activists gained the respect of research scientists and carved out a role for themselves as producers of knowledge about AIDS.

Changing Landscape of AIDS Politics

The politics of AIDS in the United States have changed significantly since the 1980s. New medicines have helped to change the meaning of HIV infection, while new federal programs have helped fight the disease. At the same time, American activists and policy makers have become increasingly concerned with AIDS in the developing world.

Ryan White CARE Act The passage of the Ryan White Comprehensive AIDS Resources
Emergency (CARE) Act in 1990 represented a turning point in the US AIDS epidemic. In the program's first year Congress appropriated $221 million in new funding for AIDS programs. The bill provided for AIDS funding at the local and state levels, as well as specific funding for groups dealing with vulnerable populations, women, youth, and children. It also created local HIV planning councils, which were to include people from communities affected by AIDS.

Although gay groups lobbied heavily for its passage, the Ryan White CARE Act’s supporters in Congress were careful not to frame it as one that would benefit gay men and intravenous drug users. During debates over the bill, supporters in Congress focused on the so-called innocent victims of AIDS: women, children, and people who had contracted HIV from blood products or medical procedures. The bill itself was named for a hemophiliac teenager from Kokomo, Indiana, who became nationally known after being turned away from his local public school because of his HIV diagnosis. Supporters also took care to frame the bill as a necessary response to a crisis, and not as a new welfare program.

The bill passed with bipartisan support but drew criticism from some corners of the AIDS services world. The program awarded cities such as San Francisco much more funding per AIDS case than many others. Critics also argued that Ryan White planning councils favored AIDS groups that had been around the longest—in short, the white gay organizations that had responded to the epidemic first.

Reauthorizations of the Ryan White CARE Act have accounted for the evolving epidemic. For example, the advent of new HIV treatments in the mid-1990s increased the importance of state-level AIDS Drug Assistance Programs, leading to a relative increase in funding to states. Appropriations have also been redistributed as the epidemic has grown in new places, particularly in the rural South. Finally, overall funding has increased dramatically, growing tenfold to over $2 billion annually in the first twenty years after the Ryan White CARE Act became law.

**Highly Active Antiretroviral Therapies** The advent in the mid-1990s of a new class of drugs—highly active antiretroviral therapies—to treat HIV dramatically altered the course of the epidemic. When used together in combination therapies, the new antiretroviral drugs brought the amount of HIV (viral load) in many patients’ systems down to very low levels. For those who responded well to the treatments, antiretrovirals offered a new lease on life. These drugs are very expensive, however, and affordability has been a significant barrier to widespread use. For some with access, antiretrovirals also brought unexpected emotional consequences. Many had spent years fighting for their lives, which were suddenly extended into the indefinite future. Some experienced “survivor’s guilt,” wondering why they had lived after watching so many friends and lovers die.

Antiretrovirals have also found a place in HIV prevention. In 2012 the FDA approved the
use of Truvada, a combination of two antiretrovirals, by HIV-negative people to prevent infection with the virus, a prevention method known as pre-exposure prophylaxis (PrEP). Meanwhile, a growing number of studies indicate that HIV-positive people with viral loads suppressed by treatment are virtually incapable of passing HIV along to their sexual partners. Both developments point to the potential for widespread access to antiretrovirals not only to extend the lives of people with HIV but to prevent new infections as well.

The advent of PrEP also reignited old battles around gay sexual culture. Critics claimed that the use of Truvada would lead gay men to abandon condoms. Kramer, who had been instrumental in the formation of both Gay Men's Health Crisis and ACT UP, accused PrEP users of being “cowardly” for choosing a pharmaceutical form of HIV prevention. Michael Weinstein (1953–) of the AIDS Healthcare Foundation similarly derided Truvada as a “party drug.” Nevertheless, the use of Truvada for PrEP rose quickly in the first few years following its approval, particularly in cities with large gay communities.

**Minority AIDS Initiative** The AIDS epidemic among African Americans continued to worsen during the 1990s. In 1994 the percentage of new AIDS diagnoses among African Americans surpassed that of those among white Americans for the first time. In this context, AIDS activists called for a greater response to the disease from black political elites.

AIDS activists had long sought greater involvement in the fight against AIDS by African American leaders. In 1991 a coalition of black, gay, and AIDS groups organized a hearing on AIDS in Black America for the Congressional Black Caucus. Only two members—Maxine Waters (1938–) and Mervyn Dymally (1926–2012)—attended. In 1996 Mario Cooper (1954–2015), a black gay politico who had served as manager of the 1992 Democratic National Convention, had better luck when he convened over 100 black community leaders at the Harvard AIDS Institute. Cooper, whose parents had been deeply involved in the civil rights movement while he was growing up in Alabama, wanted to bring the energy of that struggle to bear on AIDS in black America.
These efforts bore fruit in 1998, when community leaders worked closely with the Congressional Black Caucus to create the Minority AIDS Initiative (MAI), a $166 million federal program aimed at supporting minority AIDS groups. The MAI program has directed funds toward AIDS prevention and services among Latinos, Asian Americans, and Native Americans, as well as African Americans. Although allocations for the program quickly grew to around $400 million annually, funding has since flattened out; in 2015 the MAI received $425 million in federal funds, a modest increase over previous years.

**Global AIDS** By the late 1990s significant attention had turned to the fight against AIDS in the Global South, and especially in Africa south of the Sahara. Activists in the United States were concerned about the plight of people in poor countries, while some policy makers worried that the epidemic could destabilize affected regions around the globe.

Activists worked to make antiretrovirals, which had proved effective at treating HIV in the United States, available in the Global South as well. The high cost of the drugs made it nearly impossible for many governments to purchase them in sufficient quantities, and multinational pharmaceutical companies, with the backing of the US government, threatened legal action against any country that produced generic versions of the drugs.
Activists in Brazil, South Africa, and Thailand joined forces with their American counterparts to protest the high cost of brand-name drugs and to demand access to cheaper generic versions of the same. In late 1999 they won a major victory when US president Bill Clinton (1946–) issued an executive order allowing other countries to use generic AIDS drugs.

In 2003 US president George W. Bush (1946–) announced $15 billion in new funding for the fight against AIDS in Africa and the Caribbean through the President’s Emergency Plan for AIDS Relief. Activists claimed the new program as a victory but criticized the administration for its emphasis on abstinence-only HIV prevention programs. Nonetheless, the program represented a step forward in the fight against global AIDS, providing medical care and antiretrovirals to millions in need.

**The Affordable Care Act and National HIV/AIDS Strategy** The passage of the Patient Protection and Affordable Care Act (ACA) in 2010 also proved to be a boon to the fight against HIV/AIDS. As a result of the law’s protections for people with preexisting conditions, people with HIV were newly able to purchase private health insurance. The expansion of Medicaid under the ACA also led to higher rates of insurance coverage for people with HIV. However, some states opted not to expand Medicaid; these tended to be in the Deep South, which also had some of the highest rates of new HIV infections at the time of the ACA’s passage.

In 2010 the administration of US president Barack Obama (1961–) also released the United States’ first National HIV/AIDS Strategy, a set of goals for improving nationwide access to HIV prevention, testing, and treatment. These included reducing new HIV infections among those hardest hit by the epidemic, including black and Latino gay and bisexual men and transgender women. The strategy was updated in 2015 to reflect advances in HIV prevention research, including the introduction of PrEP. Along with the ACA, the National HIV/AIDS Strategy represented a significant step toward a truly national response to AIDS in the United States.

**An Uncertain Future** The presidential election of 2016 ushered in a new era of uncertainty for people living with HIV. Many of the cabinet appointments of Donald Trump (1946–) were widely seen as hostile to both LGBTQ people and the ACA, the repeal of which seemed likely. On the day of Trump’s inauguration, the page for the Office of National AIDS Policy disappeared from the White House website, as did all mention of LGBTQ rights. In June 2017, six members of the Presidential Advisory Council on HIV/AIDS resigned in protest, saying that the president “simply does not care” about addressing the epidemic (Schoettes 2017). In December 2017 Trump summarily dismissed the remaining members of the council.

Meanwhile, opponents of the new administration looked to the history of AIDS activism for
models of political resistance. As Republicans in Congress planned to roll back the ACA, local activists confronted them at town hall events and staged die-ins to dramatize the deaths that they predicted would follow repeal. In the summer of 2017, veterans of ACT UP and other AIDS groups joined civil, disability, and women’s rights activists in acts of civil disobedience in congressional offices, demanding that lawmakers leave the ACA in place. When the repeal effort failed in the Senate by a single vote, many credited the months of direct action inspired and sustained by AIDS activists.

**FILMOGRAPHY**

Homoerotic Poetry of Abū Nuwās

JOCELYN SHARLET
Associate Professor of Comparative Literature
University of California, Davis

Homoerotic works by the ninth-century Arabic poet.

Abū Nuwās (d. c. 814 CE) is viewed as one of the most important representatives of the movement of muhdath (renewed) Arabic poetry. He lived mainly in Basra and Baghdad. Abū Nuwās contributed to the development of dedicated poetry focusing on madh (praise), rithaʾ (elegy), ‘itab (censure), and hijaʾ (invective), often in the multithematic qasida form, which is monorhyme and written in one of a number of meters. He is best known for his poems about wine (khamriyya), love (ghazal), provocative obscenity (mujun), and hunting (tardiyya), most often in an undedicated, monothematic qitʿa form, which is also monorhyme and written in one of a number of meters, and he also composed poems about asceticism (zuhdiyya) in this form. Male homoerotic themes appear in his poems about love for a male beloved (ghazal mudhakkar), as well as poems about wine or provocative obscenity.

The Dīwān contains about 200 love poems classified as ghazal muʾannath, poems about a female beloved, and about 450 classified as ghazal mudhakkar. While the love poem genre focuses exclusively on the lover and the beloved, motifs in this genre and the circulation of love poetry in prose literature demonstrate the central issue of concealing love from and revealing it to the poet’s social circle, so that love is as much about sociability as it is a manifestation of individual subjectivity. Abū Nuwās’s erotic poetry combines several earlier traditions, including poems about chaste love, typically for a female beloved (‘Udhrī); poetry about love that is more open or explicit (ibahi); poems about the mostly inaccessible and typically female beloved of the love prelude in the dedicated qasida (nasib); and scenes of love in poems about provocative obscenity. Poetry by Abū Nuwās had a significant impact on the development of poetry in Arabic, Persian, Hebrew, and Spanish. His impact on poetry also contributed to the development of poetry used in Sufism. This entry discusses a range of love poems classified in the Dīwān as ghazal mudhakkar and the reception of poetry by Abū Nuwās, especially ghazal mudhakkar, in premodern Arabic literary sources and modern scholarship.

Poems

In the monothematic qitʿa form, poets felt free to incorporate motifs from (or that allude to)
other poetic themes. Where the tradition in European languages might use the term genre, a kind or category, the Arabic tradition tends to use the term gharad, an aim or goal. This term reflects the more prominent role of dedicated poetry, but it is also applied to undedicated poetry. In the following love poem about a male beloved, Abū Nuwās places the aim of his ghazal mudhakkar, which is evident in lines 6 to 9, in counterpoint to the nasib, which is often a prelude of the dedicated qasida, about love for an elite female beloved whose tribe has departed in a pastoral migration, which appears in lines 1 to 2.

And he said (meter: al-wafir, rhyme letter: mim)

1 I have left the abode—I do not cry
   For it, or for the ruins or the trace
2 Nor do I cry for Layla
   Or Suʿda or Salma
3 And that is because I am a man
   Who has learned something from love
4 Such as, how good union is!
   And how ugly it is to be cut off!
5 The one always requires praise
   And the other always requires blame
6 For I have fallen in love
   With a young gazelle who had made peace with me
7 Who turned benevolence into dislike
   And union became separation
8 My commander, you have only been unjust
   Because I appointed you to be my judge
9 Will you not deem justice good
   Just as you deem oppression good?

(ABŪ NUWĀS, DĪWĀN, 4:324; TRANSLATION BY JOCELYN SHARLET)

The loss of idealized joy in the past that defines the nasib is juxtaposed to the perceived injustice in the present. In between, the poet displays the conjunction between the aim of nasib and the aim of ghazal in lines 3 to 5, weaving allusions to aims of the dedicated qasida, praise (madh) and censure (ʿitab), into the experience of love, whether it is nasib or ghazal. In addition, the depiction of the beloved as “my commander” and the motif of injustice echo the aim of censure.

The following poem integrates the sensitivity and beauty of the beloved. The qualities of zarf (elegance) and adab (refined manners) may also be used for male companions who are peers in wine and hunting poetry, and they are augmented here by emotional sensitivity in line 1. Abū Nuwās juxtaposes sensitivity and beauty by repeating the formula “may I be your ransom,” an emphatic expression of commitment, in lines 1 and 4. The poet’s secrecy
in line 4 demonstrates his own competence in the sociable code of love. The reference to angelic plans places the code of love, including the poet’s “sin,” within the context of religion.

And he said (meter: *al-basít*, rhyme letter: *ba’*)

1 May I be the ransom for one in whom elegance and manners were perfected
   And who, when he is moved by music, becomes lost
2 My gaze did not come to discern his form
   But that wonder became entwined for me with its beauty
3 And his hips upon a fine sword topped by a moon
   From the light of whose cheeks the water of beauty pours forth
4 O you whom I shall not reveal, may my soul be your ransom!
   I have become attached to you with a rope that does not break
5 How many an hour mapped out by angels for you
   Do I lord it over the people with the sin that they wrote
6 [In which] I was not distracted from you by a flirtatious cupbearer with 
   One with rounded hips the flesh of whose belly is concave
7 It is as if the moon strides in his robe
   Toward the blond Greeks, revealing his lineage
8 He circulates wine whose father is the vine, whom he married to
   The son of a rainfall since her mother is the grapes
9 He turned aside and sang for us as the flute raised its plaintive cry:
   “A visitor, are you? No, but rather you are one who keeps his dista

(ABŪ NUWĀS, DĪWĀN, 4: 164 – 165; TRANSLATION BY JOCELYN SHARLET)

Abū Nuwās juxtaposes frivolous desire for an attractive young cupbearer to his more intense commitment to the beloved who is featured in this poem, and the two of them look similar. He and his beloved enjoy observing the cupbearer and drinking his wine together in lines 6 to 9, and the motif of circulation conjures a group scene. The family imagery of the wine-making process juxtaposes more ordinary life in a family to the extraordinary quality of love. The song features a visitor, an echo of the wine poem, which may depict refined revelers at a tavern or monastery run by non-Muslims. It also features one who remains distant like a beloved in nasib or ghazal. Abū Nuwās not infrequently uses citations of poetry/songs to close his wine poems, which has the effect of altering the poet's mediation between the scene and his audience.

The following love poem revolves around garden imagery. The idealized, lost joy of the nasib may evoke the Garden of Eden, and the realistic love in ghazal may be depicted through imagery of the garden, which is also featured in the wine poem.

He said (meter: *al-tawil*, rhyme letter: *lam*)
Censurers may be featured in nasib or ghazal, and they juxtapose the intimacy of love to an idea of social disapproval. In conventions of nasib the motif of departure suggests loss of a female beloved due to tribal migration, while in conventions of ghazal it refers to any beloved’s termination of a relationship. The garden imagery for the beginning, middle, and end of a relationship, as if it were all natural, implies joy and sadness about the vicissitudes of desire.

The ghazal may carry a connotation of elegance (zarf) that balances the earnest (jidd) and the comic (hazl), and a cultivation of such contrasts is important for the aesthetic, emotional, and ethical scope of the tradition of Arabic poetry. While the four poems discussed above seem mostly earnest, the two poems discussed below seem mostly comic.

The following poem playfully depicts a boy in school. His rejection in line 1 could be understood as a refusal to do schoolwork or a rejection of the lover’s advances; the worshippers in line 2 could be understood as the other people using the mosque or the boy’s admirers; and the glances in line 3 could be understood as the boy’s distraction from lessons or the lover’s perception of the boy’s flirtatious behavior. The poet ascribes his own view of the boy to the teacher in line 4, but the teacher, whose mind is on lessons, not love, dispels the attribution in lines 5 to 6.

And he said (meter: al-ramal, rhyme letter: dal)
5 Ḥafṣ said: take him away,
     For I find him stupid
6 And he continues ever since he started lessons to be a slacker
7 Silk robes were stripped off of him
     And beneath them striped garments
8 Then they terrified him with a strip of soft
   Leather, with what is in it of a rod
9 When it happened, my beloved cried,
   “O teacher, I won't come back!”
10 I said, “O Ḥafṣ, go easy on him—
     He will do well
11 In recitation of poetry and lessons and in whatever you may want!”

Abū Nuwās passed by the religious school of Ḥafṣ al-Kūfī and he was beating a
boy, and he said, “I observed a person.”

(ABŪ NUWĀS, DĪWĀN, 4:194–195; TRANSLATION BY JOCELYN SHARLET)

The beating at school in lines 8 to 9 and the poet’s intervention allude to the obscenity of
mujun. The poet’s reassurance that the boy will succeed in “poetry, lessons, and in
whatever you may want” depicts the connection between education and homoerotic desire
in this ghazal mudhakkar. The context of the mosque and the reference to poetry
demonstrate the intersection between religious and literary education, because both
involve literacy in Arabic. The brief anecdote that is appended to the poem in the Dīwān
reflects the way anecdotes that are historical or at least realistic developed alongside
poems, or in their wake, and functioned as a kind of commentary.

In the following poem, the poet’s beloved works in the market selling water (or just
wanders around), and his beauty makes him transgressive in terms of the market setting in
lines 1 to 2 because he steals glances. Abū Nuwās playfully engages with more earnest
nasib, in which a poet may insist that his travel companions stop at the traces of the
beloved’s abandoned abode in the desert, and earnest yet transient relationships in ghazal
in lines 3 to 6, where the beloved stops and then moves on due to the crowded pedestrian
traffic of the market. The lower status of the beloved and the poet’s description of him as
his master in line 1 is a convention of ghazal.

And he said (meter: al-khafīf, rhyme letter: ḥa’)

1 Indeed Ḥamdan my master
   Stays in the market and goes to and fro
2 And he had, because of his beauty
   And attractive appearance, stolen the glances [of all who see him]
3 I said, jokingly, one day
   “My love, stop for me!” and he did not stop
4 What would the problem be for him if he were to
   Accept affection and kindness
5 He stood by me for a little while
   Then he departed from me
6 If that one came to me, then my worries
   Would clear and be stripped away
7 Indeed he is a fitna for the worshippers and he is a pearl in its shell
8 And he is a sun when he appears
   And a crescent moon whenever he turns aside
9 Glorious is the king! What
   Is this ailment in my heart?
10 And this haughtiness and waywardness
    And vanity in my beloved?

(ABŪ NUWĀS, DĪWĀN, 4:4:259–260; TRANSLATION BY JOCELYN SHARLET)

The beloved is transgressive in terms of religion because he is a fitna in line 7, a source of social chaos in the context of Islamic culture. The lofty images of a pearl in its shell (pure because it is not yet harvested and pierced), a sun and crescent moon, and a glorious king in lines 7 to 9 are both earnest and comic, because they all correspond to nothing but the young beloved's haughtiness, waywardness (from the poet's desire), and vanity in line 10.

**Reception**

The poetry of Abū Nuwās, particularly his ghazal mudhakkar, is well represented in premodern Arabic sources. In his biography of the poet, Ibn Qutayba (d. 889) includes a selection of love poetry about a boy and another poem addressed to a boy (Ibn Qutayba 2001). Ibn al-Muʿtazz (d. 908) mentions at the beginning of his biography of Abū Nuwās that Wāliba b. al-Ḥubāb fell in love with him, and that this led the elder poet to mentor him in his education (Ibn al-Muʿtazz 1998). The longer biography by Abū Hiffān (d. 871) includes love, wine, and obscene poetry that features homoerotic themes as well as related anecdotes that are historical or realistic. Ibn Manẓūr (d. 1311) covers homoerotic themes in his longer biography and mentions that Abū Nuwās was rejected by three women that he loved, and “it was as if he was not making a serious effort [or: was not fortunate] with them like he was with boys” (Ibn Manẓūr 2002, 132–133; translation by Jocelyn Sharlet). Poetry by and anecdotes about Abū Nuwās are cited many times in numerous premodern Arabic literary works, including encyclopedic compilations, monographic compilations, and biographical dictionaries.

The modern scholarly reception of Abū Nuwās, and his love poetry and ghazal mudhakkar in particular, is also widespread. Muḥammad al-Nuwayhī insists that his readers come to terms with the importance of homosexuality in the life of Abū Nuwās in order to
understand much of his poetry, and also discusses selections of ghazal mudhakkar (al-Nuwayhī 1953). Al-ʿAqqād cites poems about slave women and poems about boys, explaining that the critic will find them to be similar in quality and would not prefer one over the other, just as he would not prefer poetry in one genre over another (al-ʿAqqād 1960). Ewald Wagner, editor of the most authoritative Dīwān of Abū Nuwās, observes that he was the first or one of the first poets to establish the ghazal mudhakkar in Arabic poetry, and explains that the depiction of the beloved and love are about the same in ghazal for males and females (Wagner 1965). Andras Hamori considers how ideas about love and virtue in Arabic love poetry relate to the European tradition (Hamori 1990). Muḥammad Ḥammūd discusses a poem that Abū Nuwās composed for his most famous female beloved in which he speaks of his commitment to a (male) cupbearer and other lovers, and also discusses his ghazal mudhakkar (Ḥammūd 1994). Jaakko Hämeen- Anttila points out that ghazal mudhakkar has more overlap with wine and obscene poetry than ghazal muʿannath does (Hämeen-Anttila 2005; see also Kennedy 1997; Szombathy 2013). Philip Kennedy discusses love poetry for males and females and demonstrates how “moods and themes coil around each other in diverse, sometimes antithetical configurations, managed with either abrupt or discreet transitions” (Kennedy 2005, 38); readers of English can find good translations of poetry by Abū Nuwās from all genres in Kennedy's book.

Homoeroticism in the Plays of Ibn Daniyal

MARVIN CARLSON
Sidney E. Cohn Distinguished Professor of Theatre and Performance, Comparative Literature and Middle Eastern Studies
The Graduate Center, The City University of New York

Three farces by the thirteenth-century Egyptian court poet generally recognized as the first major writer in Arab culture to create works centrally concerned with homoerotic themes.

The first known dramatist of the Arab world is Ibn Daniyal, a thirteenth-century Egyptian court poet and popular entertainer who created plays of remarkable complexity and sophistication, unequaled by any drama produced in Europe for the next several centuries. Ibn Daniyal has sometimes been called the “Arab Aristophanes,” a characterization reflecting both the range of his poetic style and also his surprising reliance on scatological and erotic material. While such material is common in folk farce material around the world, its appearance in Islamic literature—which in the West is often considered opposed to theatrical representation and to any material of an erotic nature—is for most Western readers quite unexpected. Moreover, unlike the plays of the Greek comic playwright Aristophanes (c. 450–c. 388 BCE), as well as much of the folk farce tradition everywhere, these plays of Ibn Daniyal place a strong emphasis on homoerotic material.

Biography and Background

Ibn Daniyal was actually a native of Mosul, in present-day Iraq. Mosul for several centuries had been a major intellectual and commercial center on the trading routes between India, Persia, and the Mediterranean. In the mid-thirteenth century, however, this long-standing prosperity abruptly ended. The expansion of the Mongol Empire, begun earlier in the century by Genghis Khan (c. 1162–1227), led to the capture of Baghdad by the invaders in 1258 and of Mosul in 1262. Sometime between these two events, Ibn Daniyal, then in his teens, fled, with many of his countrymen, to seek refuge in Cairo, which with the fall of Baghdad had become the political and intellectual center of the Arab world. In Cairo he supported himself for a time as an eye doctor, but he soon established a reputation among that city’s bohemian population as a wit, a gifted poet, and the active pursuer of a libertine lifestyle. In the manner of young impecunious poets throughout the ages, Ibn Daniyal sought a degree of financial security by producing poems, often panegyrics, for influential and well-to-do sponsors.
At the top of Egypt's social and political pyramid was the sultan, who, at the time of Ibn Daniyal’s arrival in Cairo, was the powerful warrior Baybars (r. 1260–1277). In 1254 Baybars had defeated King Louis IX of France (1214–1270), ending the Seventh Crusade, and in 1260 he had finally stopped the advance of the Mongols in Syria. The system he founded ruled Egypt for the next several centuries. Baybars was a shrewd and powerful ruler with little sympathy for the bohemian life that existed in Cairo when he came to power. He put strong curbs on drinking and on the sex trade, so when Ibn Daniyal arrived, the general feeling among the artistic community he joined was one of living in a distinctly repressive society.

Baybars’ son Barakah (r. 1277–1279), who succeeded him, shared his father’s stern condemnation of physical pleasures, but he lacked his father’s authority and power. He was deposed after only two years by his father-in-law, Qalawun (r. 1279–1290), who returned an interest in entertainment and the arts to the city and the court. Ibn Daniyal was among the poets, painters, and musicians supported by this more pleasure-loving court, and he became quite celebrated in Cairo and abroad for his literary skill. Eventually, around 1290, he was made the official court poet, in which capacity he wrote a number of poems in celebration of significant battles and court festivals, which still survive and are considered among the outstanding literary works of the era. Although, like Arab literary figures in general, he had little if any interest in theatrical expression, toward the end of the century he was commissioned by a wealthy patron to create three puppet plays for private performance to entertain the patron’s guests.

Puppetry is a very ancient art in Egypt, dating back to pharaonic times. Shadow puppets are more recent, thought to have come to Egypt from China by way of India or Central Asia. They are first recorded in Egypt in the eleventh century, more than 200 years before the work of Ibn Daniyal, but they existed only as a folk or popular entertainment, similar to the more recent and doubtless related form, the Turkish karagoz. No texts survive of this form before those of Ibn Daniyal, and this is hardly surprising, because despite its popularity both in the markets and at court, the shadow theater was not considered a literary form, as were poetry and some narrative genres. Ibn Daniyal's patron, however, was well aware of the poet’s literary skills and requested that in these three plays he follow the general farce tradition of the form but compose the works in a style that would mark them as significant literary contributions. This Ibn Daniyal did, with such success that these three texts alone survive out of a puppet tradition that lasted for several centuries and surely produced many hundreds of works.

All three plays are distinctly farcical in tone, with exaggerated characters and situations often involving crude physical action, and all mix elevated poetic passages with constant use of explicit scatological and erotic (most frequently homoerotic) references. Yet, the actual structure of the three works is quite different. The second play, ‘Ajib wa gharib (The amazing preacher and the stranger), is the shortest and simplest, consisting only of a rather
lengthy introduction by the “Stranger,” a kind of master of ceremonies, and a series of monologues and short acts by a series of twenty-two street entertainers—jugglers, quack doctors, animal trainers, and the like—as might be encountered in Cairo of that time. There are occasional references to homoeroticism on the part of some of the performers, but the most extensive of such references come in the largely autobiographical opening comments of the Stranger himself, whose claimed sexual experience is extensive and highly varied. He cites his considerable experience as pimp, prostitute, and patron of brothels, lamenting the loss of both the "pretty dark women" and the "rosy-cheeked boys" in his past. He laments particularly the loss of “the effeminate Zimqar,” whom he “nearly split with my big penis when he was a kid” (Ibn Daniyal 2013, 94). It should be noted that most of the names in all three plays have distinct, often obscene, meanings in Arabic.

The First Play

While homoerotic references do occur in this second play, they are far more significant in both of the other longer and more complex works. The first, Tayf al-khayal (The shadow spirit), has a plot very close to that of many later folk farces. The basic premise, on which many digressions and elaborations are developed, is that Prince Wisal, an outrageous soldier-adventurer, has decided to give up his profligate life, marry a beautiful and respectable girl, and take up a pious existence. He employs the service of a grotesque marriage broker, Umm Rashid, who describes a luscious young woman who, when her veil is removed at the wedding, is revealed as a grotesque hag. Although the major plot is a heterosexual one, there are extensive homoerotic references in Prince Wisal’s extended descriptions of his sexual adventures in the past he is now trying to move beyond. Like those of the Stranger in the second play, these adventures are varied and imaginative, including encounters not only with men and women but with all manner of beasts from dogs to donkeys. Indeed, the prince claims to have “copulated with almost any easily-caught creature, whether walking or crawling on earth” (Ibn Daniyal 2013, 59).

The Third Play

By far the most extensive presentation of the homoerotic in these plays, however, appears in the third, which is also the most complex in its action. This is Al-Mutayyam wa al-daʾīʾ al-Yutayyim (The love-stricken one and the lost one who inspires passion). At the heart of this play is another story of a failed romantic quest, but this one is a homoerotic one. Al-Mutayyam, the “love-stricken one,” is a clownish pederast who has become obsessed with a beautiful youth, al-Yutayyim, whom he has seen naked in a doctor’s office and later in the public baths. The boy flirts with him but resists al-Mutayyam’s various attempts to consummate his passion.

The play begins with an extended monologue by the frustrated lover, which describes in detail the physical beauties of his new love, the conditions under which he first saw him,
and his lack of success in attracting the youth. Embedded in the monologue are several elegant love songs and poems praising the youth. Two parallel scenes and distinctly contrasting scenes follow this introduction. The first is a dialogue between al-Mutayyam and an ugly young man who was his former sex partner and who scoffs at al-Mutayyam for deserting a devoted lover for a green, indifferent boy. Al-Mutayyam, disgusted, asks, “What is the meat of an old ram compared to the meat of lamb” (Ibn Daniyal 2013, 155), and describes how he nearly expired of longing in the baths after gaining a brief caress of his beloved’s buttocks.

A sharply contrasting scene follows in which al-Mutayyam’s valet reports that he has been extolling his master’s virtues, his beauty, his elegance, and his sexual ability to the young man, and has brought him close to the point of yielding. Indeed, the young man shortly thereafter appears and is showered with praise and expressions of passion from the delighted al-Mutayyam. The boy, however, remains cautious, seemingly fearful of giving too easy a victory and of having his reputation darkened in that way. He proposes a contest on which he is willing to barter his consent to accept the advances of his older suitor. Al-Mutayyam’s fighting cock’s abilities are widely known, and the young man proposes to match him with his own rooster, giving in to al-Mutayyam's suit if his bird is the victor.

A contest is set up, and after elaborate descriptions from their owners of the physical prowess and appearance of the two birds, the battle is joined. Al-Yutayyim’s rooster flees from the ring, but he insists it has not been defeated but has simply retired for prayers as it always does at this hour. He proposes another contest with distinct homoerotic overtones —that his pet ram (a gift from another older male admirer) engage in a butting contest with that of al-Mutayyam. Al-Mutayyam agrees. Once again the young man's contestant is defeated, but again he has an excuse: someone put a curse on his ram so that it could not perform.

Al-Yutayyim, arguing his lack of attraction to al-Mutayyam, proposes one final contest, another butting competition, this time between the two bulls owned by the men. Finally, al-Yutayyim’s animal prevails, and as the young man departs in triumph, al-Mutayyam weeps over his defeated champion and the apparent dashing of his romantic dreams. Still, he has one hope left. He orders the bull to be slaughtered to provide meat for a great feast, hoping that this will at last inspire positive feelings in his young love object: “My beloved al-Yutayyim might hear of the public invitation for the banquet and might attend it.... If he behold me in this state of vitality and physical zeal, he might eventually have a sentimental yearning for me” (Ibn Daniyal 2013, 180).

The banquet takes up the last section of the play and, much in the style of an Aristophanic comedy such as The Birds, portrays a series of grotesque visitors, playing variations on the general theme of the work. Hardly surprisingly, the majority of the guests, and the first to arrive, are all characterized by their homoerotic propensities. The first is a homosexual
A hermaphrodite named Narcissus, who extols his lifestyle and that of his “brethren hermaphrodites” and their “studs,” fifteen of each, most of them with names suggesting their interests, such as Muwiza (Little Banana) and Dalal (Pampered) among the “brethren” and Ayn al-Dakar (Eye of Penis) and Khusa (Testes) among their “studs” (183). The geographical extent of their activities is suggested by their places of origin, including the Sudan, Aleppo, Rome, Tunisia, and Morocco. The major part of Narcissus’s presentation is a sensual and detailed account of the similarity between a bowel movement after copulation in men and the giving of birth in women.

Next appears a young man named Abu al-Sahl (Easy Penetration) who is described in the stage directions as resembling “a long, erect penis” (Ibn Daniyal 2013, 184), and who characterizes himself as among the most submissive of all creatures, and therefore a great delight to his many clients. He is followed by a man named Abu al-Buhaish (The Digger) from the region of Zallaqa (Slippery). This visitor comes to complain of the noise of the event, but remains when he becomes interested in al-Mutayyam’s erect penis. A matchmaker named Baddal appears next, offering either to aid al-Mutayyam in pursuing his suit or to himself substitute for the reluctant young man. Then comes a street thug, Dawoud al-Qabba (David the Grabber), who laments the bygone days when the streets were darker and sexual victims were more easily caught. The next guest, Omayr al-Jallad, discusses the pleasures of his solitary entertainment, which he brags of enjoying everywhere, even in the street under a loose robe, and of sexually harassing women and boys in public places. Not surprisingly, he advises al-Mutayyam to relieve his unreciprocated passion by imaginary copulation and masturbation, his inevitable solution to such matters. Finally, Nabham al-Dabbab (Clever Crawler) brags about how he sneaks into darkened houses and forces sex on those he discovers there.

Each of these guests receives the same treatment from their host. He welcomes them warmly, listens to their stories, and plies them with goblets of wine until they become unconscious and fall to the floor in an ever-increasing pile of inert bodies. Three final guests end this series. The first, a Mamluk slave, announces a change of tone by commenting on the now considerable pile of inebriated and senseless bodies, stretched out amid the garbage like corpses. Despite his repulsion, however, the slave gladly accepts the multiple glasses of wine al-Mutayyam offers and soon adds his own body to the pile. He is followed by a parasite, Salhab (Glutton), who brags of his ability to eat almost anything, almost like a medieval personification of this deadly sin. He has come hoping to find food but settles for drink, and in his turn joins the other debauched sleepers.

The final guest is the most unexpected, a pious and abstemious figure with a decorum “worthy of reverence” (Ibn Daniyal 2013, 195). He both awakens and sobers the guests with a loud shout and announces himself as Azrael, the Angel of Death. The cowed al-Mutayyam asks if repentance is still possible, and, being assured that it is, he renounces his sensual indulgence and appeals for mercy to Allah. He turns toward Mecca and dies, with
his guests departing “in horror at his exemplary punishment” (196). His corpse is then placed in a white coffin and carried off to the cemetery for burial.

This abrupt and unexpected religious turn, whether it reflects the honest feelings of the dramatist or, more likely, a necessary acknowledgment of official morality after a work abounding in questionable subject matter and activities, is clearly a part of the expectations of the genre. This is evident from the fact that all three of the preserved plays, although extremely different in structure, similarly end on a pious, religious note. At the end of Tayf al-khayal, the profligate Prince Wisal, frustrated in his plan to redeem his past through marriage, decides, in the final speech of the play, to depart instead on a pilgrimage to Mecca and its holy shrines, adding, strikingly and quite surprisingly, “I am telling the truth rather than narrating a story in a shadow play” (Ibn Daniyal 2013, 85).

The Second Play

In the second play, ‘Ajib wa gharib, as in the final play, a series of characters is terminated by one who introduces a strikingly different note—again, a religious one. The play, as previously noted, is essentially a series of Cairo street entertainers presenting their offerings. The series, however, ends with a representative of a different profession, a camel driver who has just returned from a pilgrimage to Mecca. His performance is not a display of skill, his camel is not offered as evidence of his ability with animals, and he has no goods, fraudulent or otherwise, to sell. He does present a kind of performance, the singing of a Sufi hymn of praise to the prophet Muhammad, so that the play, for all its cynicism and worldliness, ends on an upbeat note of piety, as do each of the other works.

These pious conclusions notwithstanding, there is no question that for the modern reader (and surely for the original audiences) the most striking feature of all these plays is their open and frank use of scatological and sexual, especially homoerotic, material. Such free expression of these subjects has been seen only a few times in world literature. The bold authors of such works who come most readily to mind are probably Aristophanes and the French Renaissance writer François Rabelais (c. 1483–1553). To them should be added the name of Ibn Daniyal, whose boldness in such matters, in addition to his significant literary and theatrical contributions, surely justify his inclusion in such company.

Homonationalism in Africa

MEHAMMED AMADEUS MACK
Assistant Professor of French Studies
Smith College, Northampton, MA

A particular form of gay advocacy that frames gay rights in nationalistic terms that privilege American and European expressions over those of the Middle East and the Global South, particularly Africa.

Homonationalism, as first elaborated by Jasbir K. Puar (2007), refers to a nationalistic, patriotic gay-friendliness that branches out from American exceptionalism and European imperialism, claiming superiority over and rejecting religious and racial Others that it deems sexually illiberal or intolerant. It can more broadly encompass the commission of an otherwise “progressive” LGBT agenda toward less than progressive, xenophobic, Islamophobic, or racist ends. Momin Rahman (2014) coined a related term, homocolonialism, which describes how gay rights platforms are being used to mark a civilizational divide and denigrate societies that stand on the “wrong” side of it. Gay imperialism is a term created to describe the European context with its important Muslim minority in which, as a result of the activism of certain groups, the terms homophobic and Muslim seem to have become interchangeable, as have, by corollary, white and gay (Haritaworn, Tauqir, and Erdem 2008).

Homonationalism stems from the broader term sexual nationalism, which employs women’s rights discourses as arguments against immigration or as claims for civilizational superiority. Sexual nationalism can also be used to instill feelings of unbelonging in descendants of immigrants who have already become European citizens by condemning them back to cultural roots assumed to be sexually intolerant, even though these new Europeans have otherwise done everything else demanded of them for integration in Europe. Sexually nationalist or homonationalist positions are often adopted by political parties that otherwise would never endorse a pro-gay or pro-women agenda: in Europe and the Anglo-Saxon world, conservative parties have in bad faith sung the praises of women and homosexuals merely because they believe sexual tolerance is the best platform from which to pursue their more important policy goal of curtailing immigration (Mack 2017). Homonationalism coincides with otherwise progressive gestures of inclusion, such as the repeal of the “don’t ask, don’t tell” policy in the United States that used to keep gay and lesbian servicepeople closeted in the military, or the promotion of gay and lesbian membership in the Israel Defense Forces (IDF). As a result of this gesture of inclusion, the IDF is able to “pinkwash” the occupation of Palestinian lands via the formation of a public
relations image palatable to Euro-American audiences (Stern 2017). Critics have pointed out, however, that these measures of inclusion are conditioned on yet another exclusion: the gay or lesbian soldier is accepted only because he or she is conditionally and relatively superior to the current “enemy,” the projected figure of the sexually perverse brown terrorist, alternatively seen as too homosexual, in his sex-segregation practices and effusive emotional displays, and too heterosexual, in his belief in the radical difference between the sexes. Scholars have produced case studies detailing the operation of homonationalism and sexual nationalism as control mechanisms for keeping minorities in check—as seen in Germany’s relationship with its Turkish/Muslim communities (El-Tayeb 2011) and especially in France’s relationship with its residents of North and West African descent (Fassin 2010; Guénif-Souilamas and Macé 2004; Mack 2017; Cervulle and Rees-Roberts 2010; Fernando 2014).

The Concept of the Gay International

*Gay International* is a term that originates in Joseph A. Massad’s 2002 essay “Re-orienting Desire: The Gay International and the Arab World,” later included in his 2007 book *Desiring Arabs*. Massad argues that an organized network of actors and institutions—spanning from nongovernmental organizations to journalists to scholars—has made it its work to identify (and make visible as “gay”) human subjects living in the Global South who do not adhere to the homo-hetero binary, even if they do practice same-sex sexuality. This identification from beyond does not take into account whether the subjects involved want to be made publicly visible or not. Ironically, the Gay International has much in common with the Islamist groups it criticizes: they both want to publicly identify homosexuals—the former to save them and the latter to condemn them.

Most problematic in the Gay International’s value system is the unquestioned primacy of visibility, transparency, and confession (of one’s sexuality). According to the principles put forth by Michel Foucault (1978), these values are particular to a time and place: the emergence of homosexual identity in Europe and the United States in the late nineteenth and early twentieth centuries. Thus, a certain kind of gay universalism—based on gay pride and sexual liberation narratives—takes itself as the referent for all other possible homosexualities, extrapolating outward. Sexual alterity (otherness) in other countries that does not match these narratives is often deemed backward or primitive, no matter its comparative scope or age. This can include sexualities that have a different relationship to the public-private distinction, that dwell in clandestinity, that exist within traditional marriage arrangements, that are temporarily embraced or discarded or vary according to one’s age, and, especially, that do not determine one’s sense of self. While many Euro-American observers have pathologized this behavior using a variety of stigmatizing and medicalizing terminologies (e.g., “schizophrenia,” “internalized self-hatred”), one can also view in these nonhomonormative sexualities a sexual instability that cannot be assimilated
into gay universalism and, moreover, is indifferent to how it is portrayed in the foreign press.

While homosexual identity has not been historically prevalent in the region, Massad argues, neither has heterosexual identity, nor the homo-hetero binary for that matter. While *Desiring Arabs* contains a literary archive of the Arab literature of sexual dissidence in its fourth and fifth chapters, the Gay International essay, which is often read in isolation, has proven the most controversial, even netting accusations of homophobia and promulgating conspiracy theories. However, a number of notable scholars of postcolonial studies and gender studies (including Talal Asad, Gayatri Chakravorty Spivak, and Joan W. Scott [see University of Chicago Press 2007], as well as Jarrod Hayes [2016]) have cited the importance of Massad’s work. His findings have also been applied to diaspora contexts in Europe, where the rhetoric of sexual nationalism has been the most pervasive and the sexual demonization of Muslim immigrants and their descendants has been the most effective (Mack 2017). A French anti-racist activist group named the Movement of the Indigenous of the Republic made waves in 2012 when, citing Massad, one of its spokespersons claimed that the gay marriage campaign, which had succeeded in 2013, was not a priority for the African, North African, and Caribbean populations of the banlieues (multiethnic, working-class suburbs), even for those practicing same-sex sexuality (Bouteldja 2012).

The concept of the Gay International has many critics. It can approach victim blaming, as it seems to fault those in the Global South who adopt gay identity—and are public about it—for their own oppression. This argument has been met with a counterclaim: that it is the imperative of identification imposed by the Gay International that endangers visibly effeminate or nonpassing practitioners of same-sex sexuality, and that prior to the Gay International’s interventions and the globalization of sexual identity categories there was no moral panic triggering homosexual witch hunts (at least nowhere near the same extent). The debate around the Gay International also has a strong class component, with some seeing in Massad’s book the claim that it is only the elite, bourgeois classes—often educated abroad—in Arab and other Global South countries that express a need for public gay visibility (Makarem 2009). Others have pointed out that restricting one’s view of local sexual cultures in the Global South in terms of a “before” and “after” contact with the Gay International is problematic for two reasons: one, because it romanticizes a golden age of purity, authenticity, and isolation from cultural admixture; and two, because it presents the globalization of sexual identity categories as a kind of contagion (Abu-Odeh 2015; Kirchick 2007). One can retort that a critique of the Gay International actually protects sexual diversity: many local customs of same-sex sexuality have disappeared in the era of gay universalism, are currently under pressure of erasure, or have been actively suppressed from the historical record in postcolonial societies.
Euro-American Views on and Stigmatization of Africa and the Middle East

This forced amnesia with regard to homoerotic heritage manifests in the wake of a spreading Euro-American gay liberation movement that derives gay universalism from its own image, a movement that has at times steamrolled local sexual cultures that may not have the cultural capital, funding, or will to survive and promote themselves as feasible alternatives to gay universalism. This universalism threatens to supplant local sexual cultures in the public imagination as the only reference for same-sex sexuality. In the Arab world and Africa south of the Sahara, local sexual cultures have at times been erased by compatriot Africans and Arabs. In a complex historical process, indigenous populations, after encountering Europeans in the colonial arena, measured their own cultures against Europe’s and found their own morally lacking (Massad 2007): many were especially embarrassed about the ample traces of homosexuality that European explorers and travel writers had seized on and emphasized (Boone 1995). Thus, many countries “became” homophobic after contact with Europe, rewriting their own histories so as to erase any trace of same-sex eroticism. This mirrors a time line of reactions Neville Hoad has identified with regard to Africa. After a century of being faulted for their “primitivity,” Africans elaborated homophobic responses that could be taken as “reaction formation[s] in the psychoanalytic sense.” These reaction formations cause Africans to take what was in the past considered Europe’s civilized morality (in which same-sex eroticism must be eradicated) and assert it as organically local: “Anti-Western attacks on ‘homosexuality’ can be seen as responses to these prior attributions of primitiveness, and as reversals of the racist charge of retardation and/or degeneration.” At the same time, “imperial ‘civilized’ sexual norms can remain in place and can paradoxically be defended as authentically African” (Hoad 2007, 56–57).

Europe’s current stigmatization of Africa and the Middle East as the center of the homophobic world is historically ironic given that homophobic Europe historically sourced the malady of homosexuality in the regions from which it currently demands sexual tolerance. Up until the 1980s, North Africa was a shelter for Americans and Europeans fleeing the sexual intolerance of their home countries (Caraës and Fernandez 2003). Adding to the historical irony, laws criminalizing sexuality in the Middle East and North Africa region were often inherited from British and French legal codes (Massad 2007). Similarly, in Africa south of the Sahara, current official homophobic language echoes what was often heard during British control of Uganda (Hoad 2007). The nascent gay or homophile American press in the 1950s and 1960s portrayed Africa as more “liberal” in terms of sexual and gender variance than the United States (Thompson 2017).

At first, discussions of homonationalism focused on the dynamics between Europe/North America and the Middle East and North Africa region, but more recently they have
expanded to include the Global South and Africa south of the Sahara, in particular. In the face of aspersions that homophobia has always plagued the region, many African sexuality scholars and activists have insisted that homophobia, not homosexuality, is an import to the African continent. As with the Middle East and North Africa region, some scholars have stated that homophobic campaigns increased only after the infiltration of “Western” gay universalism, leading indigenous people to persecute their own sexual minorities and accuse them of being “Westernized,” even if they had never set foot abroad. In opposition to being represented as foreign additions, Africans practicing same-sex sexuality have stated their longtime connection to precolonial histories of homosexuality and traditional kinship structures, thus claiming their homosexuality and Africanness at the same time (Nyanzi 2013). Marc Epprecht (2008) has shown that “heterosexual Africa” is itself an invention, constructed over the last two centuries by a host of figures, from anthropologists, colonial administrators, and ethnopsychologists to, more recently, African elites and HIV/AIDS workers.

Uganda as Exemplar of Debates over Homonationalism

A country of central importance to these ongoing debates on the African continent has been Uganda. In 2009 David Bahati, a member of the Ugandan parliament, introduced the Anti-Homosexuality Bill, which sought to further criminalize consensual same-sex relations in the country that were already forbidden by the penal code. This legal push eventually culminated in the Anti-Homosexuality Act of 2014, which was invalidated in the same year it was signed, officially on procedural grounds but allegedly because of international pressure to cut off aid to the country. The tabloidesque Ugandan newspaper Rolling Stone (not to be confused with the American publication of the same title) had published the names of rumored homosexuals in a move that attracted strong outside condemnation. One prominent gay rights activist, David Kato (c. 1964–2011), who had led a victorious campaign against the newspaper, was assassinated, as recounted in the documentary film Call Me Kuchu (Wright and Zouhali-Worrall 2012). Kapya J. Kaoma (2013) has argued that the US Christian Right is responsible for homophobic violence in Africa. American Christian groups, after failing to stop the progress of the gay rights movement stateside, came to Africa south of the Sahara to preach against homosexuality, and some people contend that they are primarily to blame for the murderous campaigns of homophobic attacks that followed. The growing alarm around the “spread” of homosexuality in Africa south of the Sahara was fomented by American missionary and evangelical activity that sought to convince Ugandans that homosexuality was a threat to the traditional African family. The Anti-Homosexuality Bill was introduced only a couple of months after a prominent antihomosexuality conference organized by American evangelists. Scott Lively, an American evangelical pastor, was the target of a lawsuit alleging crimes against humanity as a direct result of his antigay activism in Uganda (Barry 2013).
Political speech invoking human rights also had a role to play in the escalation of homophobia in Uganda. In 2011 Hillary Rodham Clinton (1947–), then serving as US secretary of state, delivered an influential speech to the United Nations asserting that gay rights are human rights: though outwardly laudable, this equation actually imperiled humanitarian aid to certain impoverished countries by conditioning that aid on gay rights records. During Clinton’s tenure as secretary of state under US president Barack Obama (1961–), she called for foreign assistance to be used to “[promote] the protection of LGBT rights” (Clinton 2011; Obama 2011). David Cameron (1966–), the UK prime minister, threatened to stop aid to governments that ban homosexuality, while Sweden, Denmark, and Norway cut off or redirected aid to Uganda in the wake of the Anti-Homosexuality Bill’s passage (Wahab 2016). Indeed, personalities from Obama to Clinton to former Canadian prime minister Stephen Harper (1959–) were perceived as champions of gay rights in Uganda when they spoke out against homophobic legislation there, even though they had yet to express support for same-sex marriage in their own countries (2012 for Obama and 2013 for Clinton), and in Harper’s case, never did (Bowers 2012; Sherman 2015; Wahab 2016). This selective liberalism in which gay rights can be supported abroad while denied at home is a key feature of sexual nationalism (although some may say one cannot compare the denial of gay marriage with homophobic persecution).

While many queer activists have expressed dismay that a gay rights agenda would be used to perpetuate imperialist domination, the Euro-American gay press in its majority supported punitive measures against Uganda, notwithstanding calls from African activists for caution and restraint. According to thinkers such as Puar (2007), this turn is made possible by the notion that, in the era of homonationalism, gays and lesbians in general have been depoliticized by their very inclusion in the national mainstream and are thus more likely to support nationalistic measures and superpower displays of might. Even if successful in stopping homophobic legal measures, social change in Africa that is brought about by outside intervention and pressure does little to substantially alter homophobic beliefs. It is the average citizen who stands to see in such displays of force even more reasons to defend homophobia, not for its alignment with African customs but rather as a wedge of resistance against Western interference.

Some have argued that in Uganda and elsewhere on the continent the move to criminalize homosexuality was not purely motivated by homophobia. One version of events sees in the recourse to homophobia an attempt to salvage agency against neoimperialist forces that sought to impose ideal social constellations from without: thus, homophobia was merely the form a broader cultural anti-imperialism took. As scholars such as Meredith L. Weiss (2013) have argued, Ugandan members of parliament and journalists took part in a process of homophobic “countermobilization” that sought to stop the social change observed in Euro-America from being reproduced in Africa. This process was preemptive in nature because sexual minorities in Uganda had not yet massively campaigned for these rights prior to being persecuted. In this way, because of transnational networks of influence and
globalization—involving pressure from international nongovernmental organizations, politicians, and evangelists—a crisis around homosexuality erupted where none had existed before, making this not so much a Ugandan problem as an international reckoning between antigay and pro-gay forces in the United States. This escalation was fomented not just by politicians but by the European media as well, and in particular the BBC, which aired two stigmatizing programs in 2011: The World's Worst Place to Be Gay? (a profile of Uganda) and a debate titled Is Homosexuality Un-African? (Wahab 2016).

In a comprehensive summary of the Uganda controversy that recaps its major flashpoints, Amar Wahab (2016) identifies the dual prisms through which most commentators have conceptualized the escalation around same-sex desire in Africa, phrased in the form of statements ostensibly contradictory but actually quite alike: “homosexuality is un-African” versus “homophobia is un-African.” Both phrasings adopt viewpoints that themselves could be seen as un-African: the first because it reflects the evangelist-driven homophobia that had not existed prior to missionary intervention, the second because it ignores the way in which homophobia itself has become a favored African tool for signifying anti-imperialism. Using South Africa as an example, Jane Bennett (2015) asserts that viewing whatever happens in Africa as the result of entanglements with the United States causes one to ignore local contexts and happenings on the ground: she claims that US debates around same-sex marriage had less impact on attitudes in South Africa than one might think, and in the end she attributes more influence to controversies about marriage in South Africa itself. Finally, Robert W. Kuloba asks, after all the rhetorical posturing about homosexuality being a foreign import (despite its longtime implantation in African customs), whether the entire process of asking whether homosexuality or homophobia is African has instead fragilized African identities overall. Just “who is an African in the post-colonial cultural sense?” he wonders (Kuloba 2016, 6). In the end, one of the greatest casualties of homonationalism, on both the African continent and in the Arab world, is the innocence of identity formation, unrestricted and free from critical pressure or intervention.

Homosexual Acts in Shari`a

NICOLE FARES
Independent scholar
Alpharetta, GA

Perspectives on same-sex sexual activity in Islamic sacred texts.

Despite some claims that homosexuality is a Western phenomenon (Abu Khalil 1997), same-sex relations of many varieties are an inherent part of Islamic history and culture (Murray and Roscoe 1997). In the 1990s and into the new century there was a rise in literature and academic works on Islam and homosexuality by activists, academics, and self-identified LGBTQ Muslims, which has contributed to the discussion on homosexuality among Muslims in diverse contexts (Habib 2010; Murray and Roscoe 1997; Kugle 2010). Contemporary Muslim scholars have argued that humans are heterosexual by nature; therefore, homosexuality is a sinful and perverse deviation from nature (Abu-Saud 1990). And although they differ in their methods of penalizing and punishing individuals who have taken part in homosexual acts, Islamic schools of thought and jurisprudence all consider homosexuality to be unlawful (Minwalla et al. 2005).

Medieval Arabic erotic writings contain a wealth of homosexual practices, descriptions, and precise sexual terminologies, such as sahq/sahiqat (lesbianism/lesbians), mutazarrifat (elegant courtly ladies-lovers), liwat/luti (active male homosexuality/homosexual), ubnah (passive male homosexuality), and ma`bun (passive male homosexual) (Amer 2009). However, no vocabularies that exist in these texts are attributed to bisexuality, heterosexuality, or sexuality specifically.

Homosexuality in the Qur`an and Hadiths

The story of Lut (Lot in Hebrew scriptures), which is referenced seven times in the Qur`an (Wafer 1997), is often used to justify Islam’s rejection of homosexuality (Minwalla et al. 2005). In this story, God sends two angels to Lut, who offers them shelter in his house, but others in the area surround Lut’s house and demand that the visitors come out so that they “might know them,” suggesting gang rape (de la Huerta 1999). God’s subsequent annihilation of the people of Lut is interpreted as a consequence of their sexual practices and homosexuality (Jamal 2001). Yet, the Qur`an, though it narrates this divine punishment for Sodom and Gomorrah, does not specify any earthly punishment for homosexuality (Akyol 2015). And while many Islamic thinkers deem homosexuality a form of adultery, and therefore punishable on Earth, others argue that homosexuality cannot be considered
adultery because the participants cannot produce offspring as a result, and therefore it must not be punishable (Akyol 2015). In addition, many contemporary scholars and theologians have questioned this traditional interpretation of the story of Lut and have put forth alternative renditions. For instance, scholars have argued that the sins of the people of Lut were numerous and that the Qurʾan does not identify specific sins in reference to their punishment (Jamal 2001). Some suggest that inhospitality to strangers, for instance, was a reason for the punishment (Kahn 1989; Jung and Smith 1993; de la Huerta 1999). Some also argue that what is condemned in the story of Lut is not sexual orientation but sexual aggression (Akyol 2015). It was the hadiths, scholars have argued, that influenced interpretations of the Qurʾan by making a correlation between the story of Lut and homosexuality exclusively (Jamal 2001).

Hadiths, which are collections of sayings attributed to the prophet Muhammad separate from the Qurʾan, declare as punishable any act deemed insulting to Islam, including apostasy, heresy, and homosexuality. But while the hadiths are clear in their condemnation of homosexual acts, many liberal Muslims challenge the authenticity in the chain of transmission (isnad) of the texts themselves (Minwalla et al. 2005). Although traditional orthodox Muslims view the hadiths as the true words of Muhammad, others argue that the texts were written down nearly two centuries after the death of the Prophet; therefore, their authenticity is questionable.

As for the Qurʾan itself, there are divergent understandings and interpretations of the text, and of Islam's position toward homosexuality. Conservative thinkers consider the Qurʾan to be "very explicit in its condemnation of homosexuality, leaving scarcely any loophole for a theological accommodation of homosexuals in Islam" (Duran 1993, 181), while others who have relied on a more semantic analysis of the Qurʾan posit that its objections to homosexuality are comparable to its objections to heterosexual activities and nonsexual indiscretions (Jamal 2001). According to Amreen Mohamed Jamal and Omar Minwalla and colleagues, the Qurʾan does not specify a clear stance on the matter of homosexuality and homosexual behavior and does not mention a specific punishment for homosexual acts or indicate that such behavior must be punished (Jamal 2001; Minwalla et al. 2005).

**Liwat vs. Sihaq in Shariʿa Punishment**

The Arabic terms for lesbianism (sahq, sihaq, and sihaqa) and lesbian (sahiqa, sahhaqa, and musahiqa) describe a behavior and an action primarily, not an identity or emotional attachment: "The root of these words (s-h-q) means ‘to pound’ (as in spices) or ‘to rub,’ so that lesbians (sahiqat), like the Greek tribades, are literally those who engage in a pounding or rubbing behavior or who make love by pounding or rubbing" (Amer 2009, 216). Lut, or liwat, on the other hand, is loosely translated as sodomy, and defined by some as the anal penetration of either a male or a female, and by others as the anal penetration of a male only (Omar 2012). In the Qurʾan, sihaq is not mentioned at all, while in medieval Arabic
literature, lesbians are not considered to be guilty of sin, and the act of lesbianism is not considered a crime and therefore not punishable (Amer 2009). Sahar Amer argues that the surprisingly positive and accepting attitude toward lesbianism in Islamic and medieval Arab literature is a result of the general commendation of heterosexual practice and eroticism in Arab and Islamicate discourses (discourses within which Muslims are culturally dominant but not specifically with the religion of Islam). Sexuality within Islamicate discourses is explicitly celebrated and positioned at the center of religious piety. Sex is not a sin in Islam, and sexual desire is considered “both licit and desirable” (Amer 2009, 222). Paradise is described in sexual terms in the Qur’an, which emphasizes the importance of physical pleasure (Bouhdiba 1985; Khatibi 1983, 2019).

Sihaq, unlike liwat, is barely discussed in Islamic juridical literature, and the Qur’an does not mention it at all. However, some consider the term al-fahisha (sin), present in the Qur’an (4:15–16), to be a reference to sihaq. For most jurists, however, sihaq does not fall under zina (adultery) “because the phallus is one of the necessary tools by which intercourse and zina are accomplished. Two females cannot be punished for an act that they are not physically capable of performing” (Omar 2012, 240). Therefore, because penetration is considered to take place only when the penis of a man penetrates the vagina or the anus of a partner, the act of sihaq is deemed unpunishable, at least with hadd (Qur’anic punishment), as in the case of zina. The couple engaged in sihaq must be disciplined, but not executed, for although the sinful act of sihaq violates God’s divine order to protect one’s private parts, the Qur’an does not indicate any specific punishment for this act, and therefore hadd punishment does not apply (Omar 2012). Instead, couples engaging in lesbian activities are subject to ta’zir and therefore are disciplined and made to repent.

The principal and most condemned sexual sins in theological Islamic discourse are adultery (zina) and homosexuality (liwat). Adultery in Islam is defined as vaginal intercourse between a man and a woman who is neither his wife by law nor his concubine (Amer 2009). Adultery is therefore firmly condemned in the Qur’an and the sunna (the early Islamic legal tradition) and has, to some extent, contributed to the acceptance of female homosexuality in Islamicate societies: “Know that lesbianism insures against social disgrace, while coition is forbidden except through marriage” (Ibn Falītah 1977, 19). Despite there being no specific punishment or condemnation of homosexuality in the Qur’an, Islamic jurisprudents all generally regard homosexuality as one of the major sins, kaba’ir (Adang 2003). There is disagreement, however, among the traditional schools of
Islamic legal thought \textit{(madhahib)} regarding the proper earthly punishment for homosexuality, or liwat \textit{(Adang 2003; Rowson 1991; Kugle 2010; El-Rouayheb 2005)}.

How are punishments determined, then, with regard to male homosexuality (liwat) and lesbianism (sihaq), given that punishment is severe for the former and more lenient for the latter? In hadiths, when it comes to punishing those who engage in sodomy, usually the main concern is public order, whether in regard to insubordination to God \textit{(fisq)} or disorder \textit{(fitna)} (Mezziane 2008). Sara Omar’s examination of the differences in legal treatment and severity of punishment of liwat and sihaq revealed complex factors that ultimately influence jurists’ legal determinations in punishing liwat and sihaq in Muslim countries: the punishment of illicit sex between a man and a woman (adultery and fornication) is used as a paradigm for punishing liwat and sihaq; sexual intercourse is perceived as an exclusively male act of phallic penetration; and the partner’s legal status within the social hierarchy affects the outcomes of jurisprudential discussions of illicit sexual intercourse and the severity of the punishments. Although these three factors Omar lists have contributed to the establishment of legal junctions in relation to liwat and sihaq, the legal treatment of the two issues in Muslim countries is rooted in the Qur’an’s story of Lut and in hadiths, both of which have become associated with the acts of liwat and sihaq: “Juristic disagreements over the semantics and definitions of these three factors extended to the treatment of liwät and sihaq and, ultimately, became normative doctrine” (2012, 225; emphasis added).

Zina is legally defined as strictly the act of sexual intercourse with a person who is not one's spouse or (a man's) lawfully acquired concubine, and it is usually punishable by flogging or lapidation, depending on the person's state of \textit{ihsan} (spiritual purity and good earthly standing). An individual’s ihsan is judged by the jurists; however, the details are contested and debated within various \textit{madhabs}, or different schools of thought within Islamic jurisprudence (Omar 2012). Hadith is as direct in its condemnation of zina, which constitutes illicit sexual intercourse, as of a male’s illicit vaginal intercourse with a woman. Punishment of zina is decided according to hadd, which are punishments of certain acts that have been sanctioned in the Qur’an and therefore forbidden for being crimes against religion. What remains contested, however, is whether zina also encompasses anal penetration, or whether it refers strictly to unlawful vaginal penetration. Among those who define zina as unlawful vaginal penetration and liwat as anal penetration of both the male-male and male-female type, some also conclude that male anal penetration is not zina and therefore does not require hadd punishment; instead, individuals who have engaged in liwat must be punished through \textit{ta’zir} (Shalakany 2008). Morally, however, and despite this distinction, homosexual acts remain reprehensible and prohibited. Some also ground in semantics the justification for the lack of punishment, or the reduction of the severity of the punishment, of female and male homosexuality, claiming that because two words are used to describe two different acts, these two acts must be distinct from each other: “The difference in words is proof of difference in meaning” (Omar 2012, 230). The jurists who
punish couples who have engaged in liwat with the hadd punishment because they view liwat as a type of zina often quote the following sentence from the hadiths: “If a man approaches [e.g., penetrates] another man, then both of them have committed zina” (quoted in Omar 2012, 236).

The Maliki school (followed especially in North Africa), which adopts a rather strict approach to hadith in its punishment of zina and liwat, considered male homosexuality an offense graver than zina and thus meriting the most severe penalty—namely, stoning to death for both partners (Amer 2009). This school, however, permitted homosexual practices between a man and his male slaves (Amer 2009). The Shafi’i school (followed especially in Egypt and Syria), in its punishments of zina, liwat, and sihaq, distinguishes between married and unmarried individuals and between active and passive partners. If married, the partners are stoned to death, and if unmarried, they receive a lashing. The Hanafi school (followed especially in Iraq and the Farsi and Turkish-speaking regions of the Islamic world) is considered one of the more liberal schools of Islamic thought. This school assigns a less severe ta’zir punishment, which is also meant to reform and discourage others. Ta’zir punishments usually take the form of ten lashes and incarceration for a short period until the partners repent (Amer 2009).

Almost all punishments distinguish between liwat and sihaq; the latter is generally deemed a less serious offense than the former, and the least serious form of zina. Like liwat, sihaq elicits various types of punishments: some theologians prescribe 100 lashes, others prescribe the least severe ta’zir punishment, or no punishment at all (Amer 2009). In most legal texts of Islamic jurisprudence (fiqh), sihaq is not consistently addressed. Kissing, caressing, intercrural intercourse (between the thighs), and similar acts are also considered dishonorable and punishable offenses but are not subject to the above-mentioned penalties.

**Homosexuality in Middle Eastern Countries Today**

Official state scholars from the Hanafi school of jurisprudence decriminalized homosexuality during the mid-nineteenth-century Tanzimat reforms of the Ottoman Empire (Kazi 2011), so punishment for homosexuality was abolished during that period. This is an example of how social contexts and the experiences of classical Muslim jurists have contributed to the hermeneutical analysis and understanding of the Qur’an and hadiths. It is as a result of such a cultural context that some jurists interpreted references to al-zaniya (a female adulterer) in the Qur’an metaphorically rather than literally, and interpreted zina in the hadiths as a metaphor for sin as opposed to a more literal reference to adultery or fornication (Omar 2012). Jurists’ differing readings of the legal processes, logic, and social contexts have helped to illuminate the methods of reasoning and the various debates and disagreements between scholars concerning the legal treatment of male and female homosexuality. Such an approach in turn impacts other issues where the
social and semantic shape the legal debate, such as issues of gender, feminism, and sexuality. Varying interpretations of homosexuality in Islamic religious and legal texts are also significant for the cross-cultural history of sexuality, for they also challenge contemporary Western and Eastern assumptions about gender and sexuality (Amer 2009).

There are ongoing debates about interpretation of the Qur’an and hadiths, as well as about the treatment of homosexuals in Middle Eastern countries today. As in other dominant religions, there are varying understandings and analyses of Islam’s position with regard to homosexuality. This demonstrates the extent of the ambiguity of the Qur’an’s stance on the topic of homosexuality, be it in terms of activity or lifestyle (Jamal 2001). Homosexuality as an act is condemned in the Qur’an in association with people of Lut, but its punishments are not specified. Representations and data on the social and legal conditions of lesbians in the Middle East are yet to be as consistently thematized and addressed as Arab male homosexual realities and rights have been. In the Middle East, homosexual acts remain illegal and punishable in many countries and territories, including Morocco, Syria, Tunisia, Algeria, Libya, Egypt, Sudan, Oman, Kuwait, Qatar, the United Arab Emirates, and Gaza. Punishment for homosexuality can range from the death penalty—as in Saudi Arabia, Iran, Yemen, Sudan, and Afghanistan—to imprisonment, as in Bahrain, where the sentence can exceed ten years (Itaborahy and Zhu 2013).

Some jurists and thinkers, such as Abu Hanifa (699–767) and Ibn Hazm (994–1064), did not employ qiyas (a method of deducing laws on matters not explicitly covered by the Qur’an or sunna without relying on unsystematic opinion) in the realm of hudud, and refused to use zina as a model for liwat and sihaq. They concluded, as many others do today, that individuals who engage in male homosexual and lesbian acts must be punished not through hadd but through the less harsh form of punishment, ta’zir. Those who did draw an analogy between zina and liwat, and those who support this stance today, are unable to apply this parallelism to zina and sihaq. Therefore, Muslim male homosexuals continue to suffer severe hadd punishments, including execution by various means (Omar 2012). Young boys and individuals deemed intellectually disabled are not held legally accountable for homosexuality or sodomy, regardless of whether they were passive or active partners in the sexual acts (Omar 2012). As for women, although they receive a less severe punishment than the hadd inflicted on their male counterparts (mostly because they do not possess phalluses), their punishments are in many cases “contingent upon the legal position of her penetrator, rather than her own, based on the semantic argument that a woman is maznỳn bihà rather than zãniya,” meaning a woman is the defiled rather than the defiler (Omar 2012, 255).

Shahid Dossani contends that “the roots of gay intolerance seem to be more sociological and cultural than religious” (1997, 236). While contemporary mainstream Islam officially condemns homosexuality (Minwalla et al. 2005), there is a growing movement of progressive-minded Muslim individuals, scholars, and jurists who view Islam as an
evolving religion and who reinterpret the words of the Qur’an and repeatedly debate its application to modern events and laws affecting Muslims internationally.

BIBLIOGRAPHY

In theory, LGBTQI persons have human rights simply because they are humans; they are born free and equal in dignity and rights (OHCHR 2012). Yet, reports from all regions of the world evidence violence, repression, exclusion, and stigmatization against individuals because of their sexual orientation, commonly grounded in discrimination (Lee and Ostergard 2017). Indeed, in 2013 the United Nations (UN) secretary-general Ban Kimoon stated that discrimination on grounds of sexual orientation and gender identity is “one of the great, neglected human rights challenges of our time” (United Nations Secretary-General 2013). The explanation for this apparent divergence between theory and practice lies in the huge variance among states or regions on the broad question of whether homosexuality should be accepted or rejected by society (Pew Research Center 2013). Strong public opposition is particularly linked to tradition, culture, religiosity, and relative poverty. Claims of LGBTQI rights have confronted long-accepted assertions of freedom of religion and the autonomy of religious organizations (Johnson and Vanderbeck 2014). A large number of states from different regions do not accept that LGBTQI persons have the particular aspects of the human rights they claim. In addition, many states reject any suggestion of a prohibition on sexual orientation/gender identity discrimination. Thus, for LGBTQI persons, their claim to recognition and acceptance of their identity is at issue because of fundamental divisions on whether sexual orientation discrimination is prohibited as a matter of human rights law at all. There have been legal and policy successes for advocates of LGBTQI rights (Gallo et al. 2014; Johnson 2013), but as with any human rights movement, there are setbacks stemming from political and social obstacles (Altman and Symons 2016). Many of these obstacles arise from the fact that different states take diametrically opposite positions on the question of whether the rights LGBTQI persons are claiming are “existing” or “new” rights (Roseman and Miller 2011).

**International Mechanisms**

Although there is a long history of the persecution of LGBTQI+ persons and homophobic/transphobic legislation, the history of engagement by the UN is very short (McGill 2014). Since 2003 the UN General Assembly has repeatedly called attention to the killings of persons because of their sexual orientation or gender identity through its
resolutions on extrajudicial, summary, or arbitrary executions. In June 2011 the Human Rights Council, by a vote of 23 to 19, with three abstentions, adopted Resolution 17/19, the first UN resolution on sexual orientation and gender identity. It expressed “grave concern” at violence and discrimination against individuals based on their sexual orientation and gender identity. Surprisingly, it was not until 2011 that the first official UN report on sexual orientation and gender identity discrimination was prepared by the Office of the High Commissioner for Human Rights (OHCHR)—Discriminatory Laws and Practices and Acts of Violence against Individuals Based on Their Sexual Orientation and Gender Identity (UN Doc A/HRC/19/41, 17 November 2011). The report’s findings formed the basis of a panel discussion at a meeting of the Human Rights Council in March 2012. This was the first time a UN intergovernmental body had held a formal debate on the subject. An updated report was presented in 2015 with a view to sharing good practices and ways to overcome violence and discrimination in application of existing international human rights law and standards (UN Doc A/HRC/29/23, 4 May 2015).

**UN Special Rapporteur**

A major political and institutional development was the creation by the Human Rights Council of an independent UN special expert on protection against violence and discrimination based on sexual orientation and gender identity (Resolution 32/2, 30 June 2016). Member states on the council were deeply split over the appointment, and for the first time ever, there was a series of votes in the General Assembly in an attempt to reverse it on the grounds that sexual orientation and gender identity has no clear basis in international human rights law. The first independent expert, Vitit Muntarbhorn (Thailand), was appointed in September 2016, and he was succeeded by Victor Madrigal-Borloz (Costa Rica) in January 2018. The expert’s mandate includes implementing international instruments, with identification of good practices and gaps; promoting awareness of the violence and discrimination issue, and linking with root causes; engaging, consulting, and cooperating with states and other stakeholders; identifying multiple, intersecting, and aggravated forms of violence and discrimination; and supporting international cooperation and related services to assist national efforts.

**Advocacy**

Advocacy for the human rights of LGBTQI persons has aligned itself with nondiscrimination campaigns and social movements based on more established grounds, such as race, gender, and minority status. Historically, that advocacy proceeded by focusing on the interpretation and application of existing substantive rights obligations binding on state parties to human rights treaties, rather than arguing for the recognition of new human rights and new human rights instruments. The implicit assumption was that identification of sexual orientation and gender identity issues in a human rights discourse within existing
mechanisms and institutions was a necessary, if not sufficient, condition for having a positive impact on the lives of those concerned.

For LGBTQI Human Rights

The central issue of the debate in normative terms has been whether discrimination on grounds of sexual orientation or gender identity should be considered on a par with such established grounds as racial or gender discrimination. Those who support this view submit that human rights apply to everyone, and therefore everyone has the right to a private life and a family life. Provisions in international human rights instruments that prohibit discrimination tend to follow the pattern of an open list and contain a reference to “sex” and to “other status”; sexual orientation has then been interpreted as falling into either or both of these categories. This is seen as an application of the “living instrument” approach to the interpretation of human rights treaties and as consistent with their object and purpose (Toonen v. Australia [1994]). The final step is to argue that discrimination on grounds of sexual orientation can be justified only by particularly serious or weighty reasons. International human rights institutions, particularly the European Court of Human Rights (Dudgeon v. UK [1981]; Johnson 2013), UN human rights treaty bodies (Toonen v. Australia [1994]), and the Inter-American Court of Human Rights (Atala Riffo and Daughters v. Chile [2012]; Advisory Opinion OC-24 [2018]) have largely duplicated each other’s jurisprudence to reach these results. In 2006 a distinguished group of international human rights experts adopted the Yogyakarta Principles on the Application of International Human Rights Law in Relation to Sexual Orientation and Gender Identity (O’Flaherty and Fisher 2008). This is not a UN instrument, but its intended effect was to apply existing international human rights law standards to address the situation of LGBTQI people and issues of intersexuality. The OHCHR, UN Special Procedures, UN human rights treaty bodies, and the Council of Europe Commissioner for Human Rights have all referenced the Yogyakarta Principles.
Against LGBTQI Human Rights

States that oppose the recognition of LGBTQI rights as human rights, such as Pakistan, Saudi Arabia, Nigeria, Uganda, and Botswana, have tended to simply reverse the arguments relating to interpretation and application. They have not been able to deny that human rights apply to everyone, but they stress that very few national, regional, or international provisions prohibiting discrimination expressly refer to “sexual orientation.” They have criminalized same-sex relationships, which they view as not protected by the rights to private or family life. They reject the view that sexual orientation falls under “sex” or “other status,” regarding such an interpretation as going beyond the permissible limits of a purposive living instrument approach to the interpretation of human rights treaties and as inconsistent with their object and purpose. Even if such an interpretation of “other status” was justifiable, these states reject the view that such differential treatment can be justified only by particularly serious or weighty reasons. At best, a lower standard of reasonable and objective reasons is considered applicable. Or, conversely, these states argue that they do have particularly serious or weighty reasons or reasonable and objective reasons that reflect their traditions, cultures, and/or religions. Finally, they argue that the fact that some international human rights institutions have copied each other’s jurisprudence to reach the contrary result does not make that result justifiable.
Culture and Tradition

An LGBTQ Public Awareness Campaign Poster in Lithuania Reads "It's a Human Right." This poster was sponsored jointly by Amnesty International and Lithuania's national LGBT rights organization, demonstrating the sort of international and national partnership between NGOs that is critical in LGBTQ advocacy.

Some African political and religious leaders have argued that gay rights and homosexual identities are against African traditions, as well as against their cultural and religious value systems. They also argue that African states have a sovereign right to reject what is seen as an imperialist or postcolonial imposition of a particular human rights agenda by mainly Western states that have sought to influence national sentiment via aid and trade conditionality (Baisley 2015). They resent the hypocrisy that although the United Kingdom presents itself as a global leader in LGBTQI rights, it was under British colonial rule that homosexual acts were first criminalized in many of its colonial territories around the world (Richards 2013). Many of those colonial laws remain in force, for example in Bangladesh, Brunei, India, Malaysia, Myanmar, Pakistan, Singapore, and Sri Lanka (Lennox and Waites 2013). The argument of some African states and leaders is that acceptance of homosexuality is a cultural import from the West (a claim that has also been used to oppose the equality of women). This argument disregards the fact that culture and tradition are neither static nor monolithic. Nonheteronormative sexual orientations and gender identities have existed in all world regions, including Africa. Some Asian countries, such as Malaysia and Maldives, have made similar claims. They have marginalized LGBTQI
communities by promoting a narrow conception of “Asian values” that emphasizes homogenous societies where the only acceptable norm is heterosexuality. Yet even in regions that are broadly negative on LGBTQI rights, there are strong pockets of resistance, especially in Nepal, South Africa, Japan, and Taiwan. These arguments based on culture and tradition are not confined to Africa and Asia; they are also invoked in central and eastern Europe and parts of the Russian Federation (Trappolin et al. 2012). It is notable that both sides of the culture argument have utilized the same paragraph of the 1993 Vienna Declaration and Programme of Action of the World Conference on Human Rights (UN Doc. A/CONF.157/23, para 5, 25 June 1993) to support their understanding of human rights law. One side emphasizes the “various historical, cultural, and religious backgrounds” that must be borne in mind, while the other points to the “duty of States, regardless of their political, economic and cultural systems, to promote and protect all human rights and fundamental freedoms.”

**NGOs**

Awareness of LGBTQI rights as human rights can promote rights activism at the local and national levels. There are an enormous number of very active LGBTQI nongovernmental organizations (NGOs) nationally, regionally, and internationally. NGOs have played their part in advocating gay rights, although sustained efforts had to be made to persuade national and international human rights NGOs to take on sexual orientation issues as part of their agendas. A contemporary difficulty is that some feminist organizations have concerns that support for trans organizations can undermine the uniqueness of women’s rights. OutRight Action International (formerly known as International Gay and Lesbian Human Rights Commission), based in the United States, is a leading international organization dedicated to human rights advocacy on behalf of people who experience discrimination or abuse on the basis of their actual or perceived sexual orientation, gender identity, or expression (Thoreson 2014). Particularly important in strategic terms was recognition of LGBTQI by Amnesty International and Human Rights Watch as the so-called gatekeepers of the NGO movement, that is, dominant NGOs that police the boundaries of political expression of a given issue forum (Mertus 2007; Linde 2017). Transgender and intersex NGOs have relatively shorter histories. In the United States, the National Center for Transgender Equality was founded only in 2003.

It is critical for campaigners against sexual orientation discrimination that they are supported by vibrant NGOs as well as the civil society actors and the civil space they occupy. Financial and human resources are almost always limited. The use of modern communication methods—particularly videos, films, images on the internet, and contacts via social media—allows NGOs and civil society actors to become established more easily and to communicate more effectively and efficiently. Although cohesive national advocacy is growing in strength, in many states that oppose LGBTQI rights as human rights, NGOs
face restrictions and repression. As of 2017, in about twenty-five states there were barriers to the formation, establishment, or registration of LGBTQI-related NGOs. Most are in Africa and Asia. These laws limit civil society participation, as well as NGOs' abilities to bring their issues into the wider public domain and be included at the policy and political levels.

International NGOs (INGOs) have taken a more significant role in addressing problems regarding acceptance and accreditation in international forums. The International Lesbian, Gay, Bisexual, Trans and Intersex Association is an international organization, with headquarters in Geneva, that brings together more than 1,228 LGBTQI groups from 132 countries. LGBTQI NGOs and INGOs continue to battle to be accredited with international organizations and to subsequently get LGBTQI issues onto their agendas.

**Marches and Propaganda**

Pride marches both celebrate LGBTQI culture and serve as political demonstrations for more extensive legal rights. Marches have been held on all continents and some have attracted millions of participants. State and public support for and opposition to pride marches are another contemporary indicator of attitudes to sexual orientation discrimination. Denial of permission to hold and restrictions on marches or assemblies promoting gay rights have been understood as violating Articles 11 (freedom of assembly) and 14 of the European Convention on Human Rights (Alekseyev v. Russia [2010]) and Article 21 of the International Covenant on Civil and Political Rights (freedom of assembly) (Alekseev v. Russian Federation, UN Doc, CCPR/C/109/D/1873/2009). A recent trend has been for states to consider or pass legislation banning “homosexual propaganda,” particularly in relation to minors. In 2012 the UN Human Rights Committee held that the Russian Federation had not shown that a restriction on the right to freedom of expression in relation to “propaganda of homosexuality”—as opposed to propaganda of heterosexuality or sexuality generally—among minors was based on reasonable and objective criteria (Fedotova v. Russian Federation). In 2017 the European Court of Human Rights held that a ban on promoting nontraditional sexual relationships violated freedom of expression and the prohibition on discrimination (Bayev v. Russian Federation). The legislative provisions in question embodied a predisposed bias on the part of the heterosexual majority against the homosexual minority, and the government had not offered convincing and weighty reasons justifying the difference in treatment.

**Key Indicators of LGBTQI Rights**

**Decriminalization** There is a clear historic trend toward the decriminalization of same-sex sexual activity. As of May 2017, seventy-two states had criminalized consenting same-sex sexual activity between adults in private. In eight of those states the death penalty is “allowed,” or there is evidence that it occurs. In forty-five of the seventy-two states (twenty-four in Africa, thirteen in Asia, six in the Americas, and two in Oceania), the law is
applied to women as well as men. From a practical perspective, achieving moratoriums, not enforcing criminal laws, restricting the scope of applicable offenses, and educating the public are all elements of the process toward decriminalization. In 124 states there are no legal penalties for such same-sex sexual activities.

**Family Life and Personal Status** In considering the question of whether same-sex couples can establish a “family” for the purposes of the right to “family life,” European and inter-American human rights bodies have not ruled out extending the right to marry to two persons of the same sex but have left the question to regulation by the national laws of the contracting states (*Schalk and Kopf v. Austria* [2010]; *Advisory Opinion OC-24* [2018]). Thus, the trend toward legalizing same-sex marriage at the national level is an indicator of incremental support for nondiscrimination on grounds of sexual orientation. The number of countries that have legalized same-sex marriage is relatively small. As of May 2017, twenty-two states recognized or provided for same-sex marriage. Such change has come either on the basis of national court rulings or legislation (sometimes following referendums). Same-sex marriage was approved by a referendum in Ireland in 2015, and by a voluntary nationwide postal survey in Australia in 2017. Conversely, some states have introduced or reinforced restrictions on marriage. In Hungary in January 2013, a new constitution defined marriage as a union between a man and a woman. In 2018 Bermuda was the first jurisdiction in the world to reverse a law allowing same-sex marriage. However, Bermuda’s supreme court subsequently ruled that parts of the law that banned same-sex marriages were unconstitutional. Same-sex marriage is performed and recognized in England, Wales, and Scotland in 2018 but not in Northern Ireland. In *United States v. Windsor* in 2013 the US Supreme Court held by five votes to four that Section 3 of the federal Defense of Marriage Act (1996), which defined marriage as the union of a man and a woman, violated the Fifth Amendment’s due process clause insofar as certain tax laws discriminated against persons of the same sex who were legally married under the laws of their state. In another historic ruling of the Supreme Court, in *Obergefell v Hodges* (2015) a five to four majority held that the Fourteenth Amendment required states to license a marriage between two people of the same sex and to recognize a same-sex marriage licensed and performed out of state. However, the court was bitterly divided, and neither the majority nor the minority made any reference to international human rights standards or jurisprudence.

As for recognition of status, same-sex couples are offered some rights of marriage via civil partnerships, registered partnerships, or civil unions in twenty-eight states. Twenty-six states or parts thereof, mostly in Europe and the Americas, have joint adoption laws. The only African state that recognizes these rights is South Africa; the only state in Asia to do so is Israel. Twenty-seven states allow for same-sex second parent adoption (*Carroll and Mendos* 2017). The trend for all these indicators is toward greater recognition of LGBTQI rights.
**Immigration**

States that recognize full marital rights or civil partnerships for same-sex partners also usually extend to them the same immigration rights conferred on heterosexual spouses. However, an increasing number of states have decoupled the issues; they view the recognition of same-sex couples’ immigration rights as a logical requisite of application of nondiscrimination and equal protection principles, even while they have been unwilling to accept full legal recognition of same-sex unions or civil partnerships (Wilets 2011). Recognition is normally on the same basis as heterosexual spouses and, thus, may afford only limited temporary or provisional residence and on a dependency basis.

In many parts of the world, there has been increased understanding and recognition of individuals changing gender, but even progressive states have been slow to deal with the legal and practical effects (Lease and Gevisser 2017). The relative newness of the issue means that it is very much an evolving area of human rights concern. Trans immigration, as distinct from trans asylum (as in Avendano-Hernandez v. Lynch, 2015), is a good example. Some states, such as Australia, allow passports that acknowledge categories other than male and female, but most do not. Only a small number of states (Argentina and Denmark) allow individuals to change their gender category on their passports relatively easily; others require new birth certificates as evidence of gender surgery. Many states do not allow it at all. A host of practical immigration issues have also been raised, including body scanners that misfire when gender-nonconforming people go through them, pat-downs or strip searches as part of border security policies, immigration to a country that allows same-sex marriage or partnership, and immigration for the purpose of seeking gender-reassignment surgery or other medical interventions. It has also been acknowledged that trans and intersex persons held in immigration detention may be at particular risk of abuse and mistreatment from other detainees (Frankel 2016). In the United States, a significant number of transgender immigrants are unable to obtain legal permission to migrate and, therefore, arrive as undocumented immigrants, which can leave them in the same state of perpetual uncertainty as other undocumented migrants (National Center for Transgender Equality 2018).

**Persecution on Grounds of Sexual Orientation**

LGBTQI asylum seekers and refugees face distinct vulnerabilities (UNHCR 2015). In addition to severe discrimination and violence in their countries of origin, they are frequently subject to continued harm while in forced displacement. In the country of asylum, these harms may include: violence and harassment by members of the asylum seeker and refugee community; insensitive and inappropriate questioning at various stages of the refugee status determination procedure; intolerance, harassment, and violence by state and nonstate agents in countries of first asylum, undermining the possibility of local
integration as a durable solution; discrimination and safety threats in accommodation, health care, and employment by state and nonstate agents; and subjection to sexual and gender-based violence or survival sex in forced displacement. Some protective jurisprudence on persecution on grounds of sexual orientation has been developed in a refugee context. In 2008 (updated in 2012), the UN High Commissioner for Refugees (UNHCR) published its Guidelines on Claims to Refugee Status Based on Sexual Orientation and/or Gender Identity within the context of Article 1A(2) of the 1951 Convention and its 1967 Protocol Relating to the Status of Refugees (HCR/GIP/12/01, 23 October 2012). In 2011 the UNHCR estimated that at least forty-two states had granted asylum to individuals with a well-founded fear of persecution owing to sexual orientation or gender identity. Some national courts have held that individuals could not be deported to a state where they would have to hide their sexual identity, or where there was, in general, a serious risk of persecution on grounds of sexual orientation without that persecution affecting any particular percentage of the population (Frank 2012).

Health Care

Nondiscrimination, in the context of the right to sexual and reproductive health, encompasses the right of all persons to be fully respected for their sexual orientation, gender identity, and intersex status. UN human rights treaty bodies have stressed that human rights law proscribes any discrimination in access to health care and underlying determinants of health, as well as to means and entitlements for their procurement, on the grounds of sexual orientation (Committee on Economic, Social and Cultural Rights, General Comment No. 22 [2016] on the right to sexual and reproductive health). Approaching sexual orientation issues from the standpoint of public health can be a good strategic move because states may appreciate the long-term impact of the health issues on the rest of the population. Although states may be reluctant to reform laws criminalizing homosexuality, they may be willing, for example, to include men who have sex with men in national HIV plans and consultation processes to strengthen the effectiveness of national HIV responses. It is also important to emphasize the historical importance of the HIV/AIDS issue. Its rise as a global health issue gave greater visibility to LGBTQI struggles for recognition. However, sexual orientation issues can also arise within the health agenda, broadly understood. Emerging issues include so-called bathroom bills—legislation that defines access, exclusively or inclusively, to public toilets (restrooms) by transgender individuals—and the regulations by world sporting bodies on athletes’ testosterone limits to comply with the female classification in sporting competitions.

Future of LGBTQI Rights

The struggle to achieve recognition for LGBTQI human rights parallels the efforts to develop other existing rights or to gain recognition for “new rights.” What appears to
distinguish sexual orientation claims from other rights claims has been the widespread political and legal opposition with which they have been met, but a closer analysis reveals that state practice is mixed and in a state of flux, even in the African and Southeast Asian regions. In India in 2009 the high court in *Koushal* held that Section 377 of the Indian penal code (on “carnal intercourse against the order of nature”), insofar as it criminalized consensual sexual acts of adults in private, violated Articles 21, 14, and 15 of the constitution. However, in 2013 this was reversed by the Supreme Court in a judgment that was dismissive of alleged discrimination toward sexual minorities and hostile to the “so-called rights of LGBT persons.” In 2016 the Supreme Court decided to refer the issue to a five-judge Constitution Bench for reconsideration. In 2017, in *Puttaswamy and Another v. Union of India and Another*, the Supreme Court recognized a “right to privacy” in the constitution and held that “discrimination against an individual on the basis of sexual orientation is deeply offensive to the dignity and self-worth of the individual” (quoted in Madani 2017). In September 2018 India’s Supreme Court decriminalized same-sex sexual activity under Section 377. In China, attitudes toward nonnormative sexual orientations and gender identities have moved from taboo to tolerance. There are over 190 LGBTQI groups and organizations with an online presence in China, but none appears to have NGO status. In December 2014 a district court determined that the conversion therapy to which a thirty-year-old man had been subjected was illegal and that compensation should be paid; China had removed homosexuality from its list of mental disorders in 2001. In 2018, in China’s first transgender employment discrimination case, an appeals court ruled that gender identity and expression were protected under antidiscrimination laws, and that, therefore, laborers should not be treated differently in the course of employ because of their gender identity and expression.

Levels of dialogue, public education, training, and information on LGBTQI issues are increasing. Time and visibility, aided by the greater tolerance of younger persons and the ubiquitousness of the internet and social media, may bring greater understanding and acceptance, as they have with other grounds of nondiscrimination and identity, such as race, sex, and, more recently, disability. However, history suggests that progress will be neither quick nor linear (Ayoub 2016; Picq and Thiel 2015). Indeed, it is not even inevitable.

The geopolitical context that defines the relationship between LGBT activism and human rights in Latin America in the twentieth century.

The control of gender and sexuality has been part of the normative structures in Latin America since colonial times. Based on the legal subordination of women in marriage, inheritance, and property, and their exclusion from the public sphere, such control was first inscribed in the canonical principles inherited from Spanish law and then, after independence, in the secularization processes carried out as an attempt to establish secular-liberal states in the nineteenth century and part of the twentieth century (Pecheny and de la Dehesa 2014; Jaramillo Sierra 2008). Mario Pecheny and Rafael de la Dehesa maintain that the processes of exclusion characteristic of the heteronormative model did not transform with the attempts at secularization or the inclusion of the middle classes and low-income sectors in the nineteenth century or the first half of the twentieth century. Their perspective, albeit counterintuitive, correctly highlights that, on the one hand, these processes were invisible to all actors and analysts, making it a successful ideological process, and, on the other, that this ideology was internalized, not so much because of a political-religious effect, but rather as an effect of the secular-liberal principles that never questioned the hierarchical heterosexual matrix, exclusionary of nonbinary bodies and practices (Pecheny and de la Dehesa 2009).

The political processes of “normalization of sexual citizenship” (Figari 2010, 225; here and following, all translations by the authors) date back to three historical moments in the region. The first, in the 1960s and 1970s, was the emergence of the “homosexual movement,” which dealt with the invisibility or persecution and criminalization of bodies by state and nonstate actors. The second, in the 1980s, is framed within the outbreak of HIV/AIDS, which marked—especially for gay men, transsexuals, and transvestites, perceived as “high-risk populations”—a new circuit of prejudice and violence, but also prompted in the countries new regional and international articulations of activists and groups (Serrano-Amaya and Gomes da Costa Santos 2016; Raupp Rios 2010). The third
period of LGBT activism, in the mid-1980s and 1990s, describes the development of transnational bonds in the context of transitions to democracy, the emergence of new political constitutions, the scaling up of armed conflicts, and the instauration of a neoliberal model that still reigns, or has been renewed, over most of the region.

This entry examines the geopolitical context that defines the relationship between LGBT activism and human rights in Latin America in the twentieth century. Although there is plenty to be said about all the countries in the region, this text is limited to providing examples from Ecuador, Colombia, Argentina, Chile, and Uruguay. Brazil and Mexico are crucial in that they are, in themselves, a universe of pioneering inspiration for the whole continent.

**The Early Organizations**

LGBT activism in Latin America first appeared in the 1960s and 1970s. Despite the differences among the countries' movements, the initial wave of activism was marked by the context of turbulent political processes, including the presence of the revolutionary left; new women's, indigenous, and black social movements; dictatorships and repression by authoritarian regimes in many countries; and not one but several events of state persecution. Among the events and movements that inspired the collective action and politicization of youths seeking social and sexual transformation were the Cuban Revolution of 1959 (which inspired the Left), the student riots of 1968 in Paris and the Tlatelolco massacre of students in Mexico City in the same year, the 1969 Stonewall riots in New York City, and the countercultural and feminist movements of the Global North (Simonetto 2017; Figari 2010; de la Dehesa 2010). It was in this political climate that the early homosexual groups in Latin America emerged, driven, for the most part, by emblematic activists such as Nancy Cárdenas (1934–1994) in Mexico, León Zuleta (1952–1993) and Manuel Velandia Mora (1955--) in Colombia, and Néstor Perlongher (1949–1992) in Argentina.

The emerging period of the first organizations was also influenced by an ambivalent relationship to the Left (Serrano-Amaya and Gomes da Costa Santos 2016; Simonetto 2017). Initiatives by Latin American LGBT groups to link their struggles with those initiated by the Left were, on the whole, viewed with caution. For the region's leftist movements, the struggle for sexual liberation was secondary to the class struggle and perceived as an ultimate expression of “bourgeois decadence” (Simonetto 2017, 161). These early groups were “marginalized by the Right and scorned by the Left” (Pecheny and de la Dehesa 2009, 9), but it is indisputable that it was under the wing of leftist formations that the early homosexual collectives first came together (Simonetto 2017).

The pioneers in this process were groups with radical perspectives, which formed in Argentina and Mexico. The Argentine group Nuestro Mundo (Our World), founded in 1967
by Héctor Anabitarte (1940–), a trade unionist, post office worker, and former member of the Communist Party, was the first organized group in South America (Simonetto 2017). In 1971 Grupo Nuestro Mundo (GNM) joined leftist, middle-class university students (operating underground since 1967), anarchists, and religious groups to form the Frente de Liberación Homosexual Argentino (FLHA; Argentine Homosexual Liberation Front), a clearly Marxist group (Comunidad Homosexual Argentina 2018; Rapisardi 2008). Carlos Figari (2010) explains that during the 1970s the FLHA was intensely active: it participated in protests and study groups, was allied to feminist groups, and had contact with gay and lesbian groups in other countries. Despite its achievements, even after the end of the dictatorship and Juan Domingo Perón’s (1895–1974) return to power in 1973, the FLHA remained a mainly underground institution (Brown 2002). However, Perón’s death triggered increased right-wing paramilitary activities targeting homosexuals, leading to the erosion of the FLHA’s and other homosexual collectives’ ranks, a slump in the movement, and its final dissolution in 1976.

In Mexico, the emergence of the first homosexual groups was inspired by the 1969 Stonewall riots and by the political, social, cultural, and ideological transformations of the 1970s. In August 1971 a group of intellectuals led by the activist Nancy Cárdenas founded the Frente de Liberación Homosexual Mexicano (FLHM; Mexican Homosexual Liberation Front) in Mexico City (de la Dehesa 2007). As with the FLHA, the FLHM had a predominantly radical agenda and was distinguished as being a “pioneer gay and lesbian organization, which served as a seedbed of future drivers of the lesbian and gay movement.” Its roots went back to “communist circles” and highlighted “the role of workers in the liberation of the oppressed” (Mogrovejo 2000, 63). The FLHM split in 1973 as a result of internal pressures, primarily because of differences between its male and female members. Other groups were subsequently formed: Grupos de los Martes y los Viernes (Group of Tuesdays and Fridays), the Grupo-Grupo (Group-Group), and Sex-Pol, which had “a strong reflexive nature, raising awareness about the homosexual” (Figari 2010, 230). In 1978, against the backdrop of a political demonstration to commemorate the tenth anniversary of the student movement of 1968 and the Cuban Revolution, the various groups reunited as the Frente Homosexual de Acción Revolucionaria (FHAR; Homosexual Revolutionary Action Front) (Simonetto 2017).

Also in the 1970s, lesbians in women’s groups mobilized. In 1975 Mexico City celebrated the World Conference of the International Women’s Year, a space in which lesbian women took the floor. The Lesbos group was founded in 1977, followed by the Oikabeth group, which included a dissident part of the Lesbos group and former members of the FHAR (Mogrovejo 2000). At the same time, some transgender groups, such as Mariposas Rojas (Red Butterflies) and Mariposas Negras (Black Butterflies), appeared (Argüello Pazmiño 2013).

In the same way as in Argentina and other South American countries, the emergence of gay
and lesbian movements in Brazil was marked by dictatorial oppression (1964–1985). In the 1960s and 1970s, the dictatorship of General Emílio Garrastazú Médici (1905–1985) launched a campaign to “cleanse” society of homosexuality, considering it a manifestation of immorality (Green 2010, 78). The alliance with the Left (especially with Partido Obrero [Workers’ Party]) politicized the gay groups and collectives, and it allowed their organized emergence by the end of the 1970s. The organization Somos (We Are), so called as homage to the FLHA publication of the same name, was the first gay organization in Brazil. As mentioned by Figari (2010), because of the tension with gay men and the need to organize themselves around their own agenda, lesbians from Somos separated off and formed a new group called the Grupo de Acción Lésbica Feminista (Lesbian Feminist Action Group), which fought for ten years, until its end in 1990, for the rights of lesbians in Brazil. In parallel, in 1980, the academic and activist Luiz Roberto Mott (1946–) propelled the first LGBT human rights organization in Brazil, the Grupo Gay da Bahia (Gay Group of Bahia). The group’s activities turned toward the defense of human rights and the exposure of violations against LGBT people.

In Chile, sexual minority groups emerged in the midst of a prevailing climate of political polarization and an intensification of the social conflict marked by the victory of Salvador Allende (1908–1973) in the 1970 presidential election (Robles 2008). The sociopolitical environment led a group of homosexuals, transgender people, and lesbians from low-income origins “to demonstrate for the first time in the center of Santiago. Around fifty people protested police abuse, but they were soon beaten and dispersed by the police forces. In the same way as the socialist project, this pioneering initiative sank vis-à-vis [Augusto] Pinochet’s dictatorship” (Simonetto 2017, 170). Following the 1973 coup d’état and the subsequent establishment of the dictatorship (1973–1990), the repression of sexual minorities intensified; the emerging homosexual community, which had been forming under the Allende government, was restricted by curfew, “leaving them engulfed in the underground and under military surveillance” (Palacio Vargas 2017).

The Integración (Integration) group appeared in 1977. It was the first gay organization that existed under Pinochet’s dictatorship. This group, in contrast with other dispersed collectives of the decade, “did not have a revolutionary goal, rather it sought social acceptance” (Simonetto 2017, 170). The group met in private houses, where its members gave educational talks on homosexuality. These activities created political awareness in the movement and forged networks of new homosexual collectives and leaders, which, in 1982, culminated in the first gay congress in Chile.

While in Argentina, Mexico, Brazil, and Chile, LGBT mobilization emerged in the 1970s, in countries such as Uruguay and Ecuador the sociopolitical and violent context contained any attempt at collective action during the entire decade. The origin of Uruguayan LGBT groups can be situated around 1984, toward the end of the authoritarian military dictatorship (1973–1985). According to the activist and academic Diego Sempol (2015), state violence
during the dictatorship and the early years of democracy inspired the formation of these groups. The year 1984 saw the creation of the first gay organization, Fundación Escorpio del Uruguay (Grupo de Acción y Apoyo Homosexual) (Scorpio Foundation of Uruguay [Homosexual Action and Support Group]). The organization emerged after a meeting of twenty friends who organized as a social movement both to help homosexuals and to “understand themselves” (Sempol 2016, 20). Two years later, in 1986, came the formation of Homosexuales Unidos (United Homosexuals), an LGBT organization of great prominence on the Uruguayan scene that mobilized against state violence. Homosexuales Unidos gave great visibility to the problems that homosexuals had to live with and progressively adopted alternative agendas such as that of the transgender groups.

Finally, in Colombia, the first homosexual groups appeared at the beginning of the 1970s at the same time as the Argentine and Mexican ones. In 1970 the writer León Zuleta and the activist Manuel Velandia Mora created the Movimiento de Liberación Homosexual Colombiano (MLHC; Colombian Homosexual Liberation Movement) in order to transform the oppressive social institutions and the arguments on which they were based (Sánchez Barrera 2017; Serrano-Amaya 2012). Zuleta was a prominent figure on the Colombian LGBT scene of the 1970s and 1980s. His transgressive and unconventional personality turned him into a recognized figure that was very visible within the movement. In 1977 he led a series of meetings with homosexual groups aimed at promoting dialogue between the collectives, the conformation of solidarity networks, and the consolidation of national agendas. The meetings gave rise to the Grupo de Encuentro por la Liberación de los Güeis (Meeting Group for the Liberation of Gays) (Velandia Mora 2016). December of the same year witnessed the emergence of the Marxist newspaper El Otro (The Other) as a flagship publication of the MLHC (Serrano-Amaya 2012). Its slogan was “of sexualities and counterculture,” and it was considered the first medium to advocate for the recognition of gay rights in the country’s public arena (Simonetto 2017, 171). From its beginnings, LGBT mobilization in Colombia was especially the target of violence by both state and nonstate actors. The confluence of the moral rejection of homosexuals and the presence of legal and illegal armed groups that defended traditional gender roles created a dangerous environment for LGBT people (Centro Nacional de Memoria Histórica 2015). In such a context, the creation of gay movements and the struggle for their recognition was, above all, an act of courage.

**The Impact of HIV/AIDS on LGBT Mobilization**

The second wave of mobilization for LGBT rights in Latin America was marked by the appearance of HIV/AIDS at the end of the 1970s, reaching its peak in the 1980s (Pecheny 2003). In the midst of the crisis, the LGBT movement took a turn and emerged with renewed vigor through a new type of collective organization. Awareness groups, social denunciation meetings, and magazines were replaced by advocacy efforts and a search for
the recognition of human rights—in particular, the right to health. As José Fernando Serrano-Amaya mentions, “The struggle for a wide cultural transformation gave way to more specific, identity-based demands. Instead of relying on demands related to sexual liberation and cultural transformation, new activisms that emerged in Latin America were mainly focused on providing care to those affected by AIDS” (Serrano-Amaya and Gomes da Costa Santos 2016, 2).

Gay men and, to a lesser extent, transvestites became visible after the first public cases of HIV/AIDS in Latin America (Pecheny 2003). This visibility, however, had paradoxical consequences. The appearance of HIV/AIDS exposed gays as the cause of a public health problem, increasing discrimination and veering public opinion toward stigmatization. Yet, HIV/AIDS also brought political opportunities for the recognition of gay rights and the strengthening of social mobilization. The HIV/AIDS crisis impelled the movements of the 1980s to establish a dialogue with other actors, such as state and international institutions, to advocate both for the recognition of the right to sexuality as a human right and for access to international cooperation and funding (Serrano-Amaya and Gomes da Costa Santos 2016).

In such countries as Colombia, Brazil, and Ecuador, the emergence of HIV/AIDS in the 1980s and the beginning of the 1990s intensified discrimination against homosexuals, as they were considered the only vector of the disease. According to a 1996 report by the Comité Intereclesial de Derechos Humanos en América Latina (Inter-church Committee on Human Rights in Latin America), many of the sexual minorities or people who worked with HIV/AIDS prevention organizations in Colombia were the object of multiple attacks and death threats. The social climate in Brazil was no different. Shortly after the first publicized HIV/AIDS-related death in Brazil in 1983, the term risk group was popularized in public discourse in reference to the epidemic (Klein 1998). The response to this discrimination by the media and the state was the emergence of organizations dedicated to vindicating the image of homosexuals. The activism of the 1980s in Brazil can be attributed mainly to nongovernmental organizations (NGOs) in charge of developing campaigns and actions aimed at reporting the implications of HIV/AIDS and the need to guarantee access to health for homosexuals. The role of NGOs, in particular of the Grupo Gay da Bahia, was so relevant that by 1994 there were already over 500 organizations in Brazil (Klein 1998).

In Ecuador during this period, HIV/AIDS was proclaimed as a new “plague” and identified as the consequence of practices attributed to homosexuals. In this context, several organizations saw the possibility to claim legal changes and protect the health of homosexuals. The Sociedad Gay (SOGA; Gay Society) group, as well as other gay collectives, emerged in the midst of national turmoil surrounding HIV/AIDS. This situation also led to the creation of the Fundación Ecuatoriana de Ayuda, Educación y Prevención del SIDA (Ecuadorean Foundation for Aid, Education, and AIDS Prevention), which promoted the development of civic action to encourage the viability of human rights, diversity, gender
equality, and social justice, as well as the elimination of all forms of discrimination, and the creation of the first Red Nacional LGBT (National LGBT Network) and the Red de Organizaciones con Trabajo en SIDA (Network of Organizations Working with AIDS) (Mancero Villarreal 2007).

With the arrival of HIV, the activist groups, which in the 1970s had been characterized by their radical discourse, transformed their relationship with the state. In Mexico, for example, “if the epidemic reinforced stigmatization and prompted incidents of state repression, the purportedly politically neutral frame of public health also opened limited opportunities for gay activists to articulate linkages with the state” (de la Dehesa 2010, 154). The gay collectives began to include new types of activities in their agendas; informing about the disease and its possible treatments, conferences, advocacy before public authorities, and the use of legal resources were the new repertoires that progressively monopolized the organizations' actions. Although HIV/AIDS opened up new spaces and opportunities for discussion for gay groups, this privilege was exclusively for gay men. The agendas of lesbian women and transgender people did not enjoy the same visibility in the public debate, leading them to activate new processes of politicization alongside feminist organizations (Argüello Pazmiño 2013).

Argentine groups also modified their means of appealing for recognition. In contrast with the FLHA of the 1970s, the gay movements of the new decades did not expose homosexuality as a form of transgression, “but rather as a lifestyle choice as legitimate as any other” (Pecheny 2003, 257). According to Mario Pecheny, “the language of liberation is replaced by that of rights. The corresponding community and contemporary gay-lesbian movements also attempted to redefine homosexual identity in terms of gay identity” (2003, 257). The Comunidad Homosexual Argentina (Homosexual Community of Argentina, the first postdictatorship organization of sexual minorities, was also founded in the mid-1980s. During the 1980s, most of the activists in this organization focused on securing a space of visibility for gay communities, and in 1988 the group promoted awareness campaigns on HIV/AIDS together with the Pan American Health Organization. Subsequently, in the early 1990s, a number of NGOs, such as Fundación Huésped (Guest Foundation) and Fundar (Found), joined health professionals in the fight against HIV/AIDS, which was the result of the totalizing effect of HIV/AIDS on the collective action of gay groups. Similar to the situation in Mexico, some activists decided to separate from the struggle against HIV/AIDS to establish their own agendas. This led to the formation of a new wave of groups, such as Gays y Lesbianas por los Derechos Civiles (Gays and Lesbians for Civil Rights).

**Democratization and Transnational Groups**

This section focuses on the democratization processes, responsible for the political renewal of activism in Latin America. The end of the dictatorships and the appearance of accentuated social and pluralist constitutions marked the beginning of a new moment in
the genealogy of LGBT mobilization. The fight against HIV/AIDS had placed human rights at
the forefront of the struggle, but the 1990s brought new circumstances that activated the
use of the rights and the search for legal reform as the dominant repertoire. The
revaluation of the rule of law and the new charters of rights coincided with increased
violence against LGBT people. This paradox was inherent to the region’s experience of the
1990s: the emergence of a progressive discourse of human rights and the recognition of
marginalized minorities coexisted alongside growing cultural and systemic violence against
these groups (Lemaitre Ripoll 2009).

LGBT activists in the 1990s used international platforms to seek recognition of sexual
rights. The first explicit reference to sexuality, sexual orientation, and sexual rights in the
international human rights discourse appeared after the 1993 World Conference on Human
Rights in Vienna (Serrano-Amaya 2012). Two years later, the participation of lesbian
groups was important in questioning the topic of sexual diversity in international bodies. At
the Fourth World Conference on Women in Beijing, in 1995, lesbian groups, aligned with
women’s and feminist groups, insisted on the explicit recognition of discrimination on
account of sexual orientation. However, the legitimization of sexual rights for women
 accorded in Beijing “was not accompanied by equivalent advances in terms of the rights of
sexual diversity (homosexual, lesbians, bisexual, transsexuals, transgender, sex workers)”
(Corrêa 2008, 28). Given the systematic opposition of conservative sectors, it was not
possible to include a specific mention of sexual orientation in Paragraph 227 of the Beijing
Platform for Action, a paragraph referring to the multiple forms of discrimination against
women. In any event, the participation of lesbian women in the conference “served to raise
awareness regarding the exclusion of lesbians from existing human rights guarantees and
laid the groundwork for future action at the local, national, and international level”
(Rosenbloom 1995, xi).

In the 1990s human rights discourses, even if uncritically applied (Corrêa 2008), drove
activists to focus on international bodies, forging international networks of LGBT
organizations. The International Lesbian and Gay Association (ILGA) and the human rights
organizations Amnesty International and International Gay and Lesbian Human Rights
Commission (IGLHRC) were key in accompanying the national groups in the
documentation and diffusion of human rights violations against LGBT people and the local
struggles on which these groups embarked.

The ILGA was founded in 1978 as the first effort to promote international gatherings
between LGBT activists, and it included over 1,000 organizations in 117 countries as of
2018 (by which time it was officially known as the International Lesbian, Gay, Bisexual,
Trans and Intersex Association). During early ILGA meetings, the question about the
participation of “Third World” countries emerged as a central topic of debate (de la Dehesa,
2017). Many of the discussions focused on the concern that the ILGA may be a “First World
organism whose main interests were not precisely related to the Third World but rather in
the interlocution with supranational bodies” (Mogrovejo 2000, 273). In time and through the pressure exerted by Latin American groups, the ILGA became stronger in the region. The organization’s thirteenth annual conference was scheduled to take place in Guadalajara, Mexico, in 1991; three years earlier, “the Grupo Orgullo Homosexual de Liberación [Homosexual Pride Liberation Group] of Guadalajara requested to be the venue for the conference, and the request was accepted provided that lesbian women were involved” (Mogrovejo 2000, 275). For the first time in history, a transnational LGBT event would take place in Latin America; however, local authorities, in a joint effort with the Catholic Church, launched a campaign to stop the event. The mayor of Guadalajara, Gabriel Covarrubias Ibarra, declared in an interview with Metrópoli newspaper that “an event of this nature cannot be authorized under any circumstances; neither our customs, nor our history, education, religion, or anything else permits it” (quoted in Comité Intereclesial de Derechos Humanos en América Latina 1996, 20). Given the mayor’s declaration and fear of possible police action, the conference was moved to Acapulco. Despite this rejection by the authorities and religious and far-right groups, the scandal made the topic more visible and led to the intervention of the National Human Rights Commission and of groups of intellectuals and artists who openly pronounced themselves in favor of the event (Mogrovejo 2000). In June 1995 the ILGA held its seventeenth conference in Rio de Janeiro with 300 participants from almost sixty countries, including delegates from eight Latin American countries (Comité Intereclesial de Derechos Humanos en América Latina 1996).

The IGLHRC (today OutRight Action International) worked in San Francisco with volunteers and no resources except for the few things volunteers could provide. But those volunteers had good contacts and connections with individuals and groups in the region (per the authors’ personal communication with founder Julie Dorf in 2018). Between 1995 and 2001, the IGLHRC co-sponsored reports in Colombia and Brazil and published a global report on the situation of lesbians, as well as a 2001 report, The Rights of Transvestites in Argentina, led by Lohana Berkins (Berkins, Sarda, and Long 2001). In 1997 Amnesty International also published Breaking the Silence, a global report on human rights violations based on sexual orientation.

By 1994 there were five gay and lesbian organizations in Colombia that together created the Asociación Colombiana de Lesbianas y Homosexuales (Colombian Association of Lesbians and Homosexuals) (Ordoñez 1995). In 1995 the activist Juan Pablo Ordoñez published No Human Being Is Disposable, a joint report of the Colombian Human Rights Committee, the IGLHRC, and Proyecto Dignidad por los Derechos Humanos en Colombia (Dignity Project for Human Rights in Colombia). The report documented “social cleansing” based on sexual orientation and emphasized the prejudice, violence, and material difficulties suffered by low-income LGBT people. Increased violence occurred in parallel with the issuance of the 1991 constitution, which marked a new era of legal progressivism in Colombia’s political history. The secularization of the state, the transformation of a formal liberal state to a social state, and the creation of the Constitutional Court as the
primary institution of control for fundamental rights are some of the transformations introduced by this new political charter. In fact, LGBT actors—both individuals and groups—successfully resorted to this court and obtained protection for their right to privacy, to equality in access to health and education, and to rectifying sex within official documents without any medical or psychological requirement.

The case of Marta Álvarez provides an example of how organizations saw the regional human rights platforms as an opportunity to remedy what the law could not achieve at the national level. Álvarez was denied the right to conjugal visits in prison given her sexual orientation as a lesbian. She brought the matter to the Comisión Interamericana de los Derechos Humanos (CIDH; Inter-American Commission for Human Rights) with the support of national and international LGBT and women's groups, and in 1999 her case became the first sexual orientation–related case admitted by this body. In 2014 the CIDH sided with Álvarez; the outcome of the case was a state apology to Álvarez and a commitment to concrete action to prevent future discrimination. Whether these advances in rights are a guarantee of substantial sociocultural transformations is a controversial issue, but, in particular, the Álvarez case “not only [led] to a legal change, but also [served as] a contribution to the development of the political agendas of the feminist movements and homosexual and transgender groups and organizations in Colombia” (Serrano-Amaya 2006, 346–347).

Through the 1995 IGLHRC special publication *Unspoken Rules*, a collection of reports covering the situation of lesbians in the world, including some Latin American countries, activists revealed how “women face violence, harassment, and discrimination because they reject socially imposed gender roles and because they have intimate relationships with other women” (Rosenbloom 1995, ix). In Argentina, for example, the process of democratization generated the conditions for groups of lesbians and gay men to emerge in the 1990s, but this was not enough to end prejudice, the state's authoritarianism, and Catholic discourse against LGBT populations. Although same-sex sexual relations were not considered a crime, law enforcement agents could arrest homosexuals through “police decrees” that were regulations through which they determined what constituted a contravention of the social order.

In Uruguay, LGBT people, and especially lesbians, were vulnerable to various forms of harassment and discrimination, even though the Uruguayan Constitution included norms that, in theory, protected them from persecution and rejection. During the 1990s such lesbian organizations as Lesvenus and Las Mismas (The Same [Women]), as well as mixed organizations such as Homosexuales Unidos, faced abuses that continued even after the transition to democracy (Martínez 1995). *Unspoken Rules* also revealed that in countries such as Mexico, where dictatorships were not the rule during the twentieth century, the situation of lesbians and gay men was not radically different: they were subjected to violence from religious groups, which reinforced a normative vision of heterosexuality
In 1996 the well-known Brazilian activist Luiz Roberto Mott (the founder of Grupo Gay da Bahia) published a report, cosponsored by the IGLHRC, called *Epidemic of Hate*, which cataloged human rights violations suffered by gays, lesbians, and transgender people in the country. The report included an important component on the historical origin of homophobia, as well as the effects of an antigay ideology predominant in Brazil in the 1980s and 1990s. The introduction to the report begins with a sentence that explains the situation in Brazil and, to some extent, in the region during the 1990s: “Behind its international reputation for welcoming sexual diversity, Brazil hides a shocking secret: a homosexual is brutally murdered every four days, a victim of the homophobia that pervades Brazilian society. The land of *Carnaval* is full of contradictions” (Mott 1996, 1).

Another important example of how the human rights discourse prevailed in the region was the mobilization around the decriminalization of homosexuality in Ecuador. Triángulo Andino (Andean Triangle) was the country’s first group of collectives whose aim was to gather signatures to appeal to the Tribunal of Constitutional Guarantees to abolish Article 516 of the criminal code. Under heavy national and international pressure, on 25 November 1997 the Tribunal of Constitutional Guarantees decided unanimously to decriminalize homosexuality in Ecuador, opening a pathway to the visibility of LGBT people in the country. This was confirmed the following year by the celebration of the first gay pride march and legal reform that led to the enactment of the first political constitution in Latin America to explicitly prohibit discrimination on account of sexual orientation (Xie and Corrales 2010).

**Conclusion**

Legal achievements have undoubtedly brought benefits to LGBT people in the region. The repeal of oppressive laws, the recognition of local rights, and international commitments ratified by the states have provided social movements with the legitimacy to speak based on the authority of the law. However, legal mobilization has not eliminated the limitations of human rights discourse—its claims of ideological neutrality, invisibility, and universalism. For example, to argue that human rights are claims made before the state and its agents may subject LGBT groups and individuals to greater vulnerability vis-à-vis the violations against them committed by nonstate actors, including their families (Thoreson 2017).

The issue of universality has been an object of constant debate; the human rights debate reflects specific epistemological and cultural visions, one example of which, as pointed out by Roger Raupp Rios (2010), is that LGBT rights in Europe and North America are created and developed based on claims for the right to privacy and nondiscrimination—or negative rights—whereas in Latin America, it is social rights—or positive rights—that mark LGBT
As mentioned by Sonia Corrêa, “the actors of sexual politics” assumed different versions of the universalism of human rights without much consideration of their implications (2008, 34).

Despite accepting these criticisms, social movements, including LGBT movements, among others, have managed to operate around such debates. The distinction drawn by Stephen Hopgood (see Thoreson 2017) between human rights in lowercase and Human Rights in capitals is useful to illustrate what has happened in the region’s activism, and it is the use of the notion of “human rights” as a signifier that invokes numerous and even contradictory claims for social and sexual justice. Human Rights, in contrast, is a very formal ideological circuit among New York, Geneva, and London, focusing on international law, criminal justice, and institutions of global governance—a space for elites that does not correspond to what most in-field human rights activism uses in a flexible, diverse, and adaptable fashion to formulate the need for change (Thoreson 2017). This, despite the substantial theoretical differences in the foundational arguments, can be related to what Corrêa points to when she talks about the tensions derived from the contemporary epistemology of sexualities: the postmodern perspective on sexuality rights and the law as possible remedies for injustice. That is, it highlights “the fluidity, the instability of sexual practices and identities—and [contrasts them with] the Enlightened and Kantian principles that continue to predominantly constrain the contemporary paradigm of human rights” (2008, 32–33).

It can be said that at the end of the twentieth century and beginning of the twenty-first century, LGBT activism in Latin America has worked on the articulation of a programmatic or deconstructive rights discourse on justice, whereby it sheds light on the tensions that coexist in the field without being canceled out. The most important effects of addressing the rights debate have been, as maintained by Julieta Lemaitre Ripoll, of symbolic weight. The decisions and laws that recognize the equality (as normality) of LGBT people have an effect on the self-perception of gays, lesbians, and transgender people that consists of the “the possibility of articulating an identity and understanding of community life within a meaningful social network” (2009, 272).

Human Rights and Queer Arab Refugees

NICOLE FARES
Independent scholar
Alpharetta, GA

At no other time have gay rights been regarded as more successful on the global front, and more deeply contested. Since the beginning of the Arab Spring in late 2010, revolutions have brought down corrupt governments and dictators in the Middle East, transforming the region into a hotbed of political and social change. These transitions carry along with them conflicting issues, including the factor of LGBT refugees. Amid the revolutions and the human events taking place, many Arab LGBT individuals have grown more unsure of their future as a community. Queer refugees continue to rely on social media and blogs to reach the Middle Eastern and international LGBT communities; to come to terms with their identities as queer, Arab, and refugees; and to discuss and understand their experiences outside their native countries.
was threatened with being reported to the authorities as a lesbian. Turkey’s close proximity to the Middle East, coupled with its relatively more liberal society, draws some Middle East queer refugees to seek asylum there, although discrimination, the high cost of living, and the lack of support means that many LGBTQ refugees still struggle to survive.

As of 2017, over 1 million Syrian refugees resided in Lebanon and more than 3 million resided in Turkey (UNHCR 2017) as a result of the Syrian uprising and subsequent civil war (2011–). Many Syrian LGBT refugees view their current situation as temporary as they seek asylum in Western countries. Queer Syrian individuals struggle to survive in Lebanon and Turkey owing to various factors, including discrimination, the high cost of living, and lack of support. The majority of Syrian refugees in the Middle East register with the United Nations High Commissioner for Refugees (UNHCR) to access support, and most of them do not disclose their sexual orientation for fear of experiencing discrimination and violence from their families and conservative Middle East societies (Du Verdie 2014). Although Lebanon’s LGBT community is growing in prominence owing to organizations such as Meem, Helem, and MOSAIC (MENA Organization for Services, Advocacy, Integration and Capacity Building), homosexuality remains taboo in mainstream society. In such an economically troubled, conservative country, many gay Syrian men struggle to provide food and shelter for themselves and their families and are forced into prostitution as a means of survival (Du Verdie 2014). As a result of the financial hardships and difficulties refugees can encounter accessing services, LGBT Syrians are increasingly reliant on the help of others. Turning to Syrian communities in Lebanon and Turkey proves problematic for them, as members of these communities endorse values from their country of origin that are homophobic or conservative. Reduced to dependence on others for survival, many LGBT Syrians are at risk of being abused, and if in need of protection, limited support is provided to them by foreign states. In the case of gay refugee Muhammad Wisam Sankari, for instance, he reported many threats by violent male groups before he was found decapitated in Istanbul in 2016. No protection was provided to Sankari despite his many attempts to seek help from the Turkish state, and little was done following his death, as no arrests were made by the Turkish police (Moore 2016). LGBT Syrians are therefore growing more unsure of their safety in the Middle East, and the majority of them are seeking asylum in Western countries, hoping to gain access to more secure and LGBT-friendly spaces.

As attention and criticism have been directed toward the discriminations LGBT individuals are facing in the Middle East, little has been written about the trials of Syrian LGBT refugees in Western countries. For, after facing persecution and violence in their home countries, and enduring transitions to neighboring states, the refugees given access into Western countries face political, socioeconomic, and psychoemotional stresses. To be granted refugee status on the grounds of sexuality is to enter a highly charged discursive arena that has existed since the adoption of the United Nation’s 1951 Refugee Convention (McGhee 2003). The main controversy surrounding this topic centers on the granting of asylum to individuals for persecution stemming from their belonging to a certain social group, making this provision the most contested in refugee law.
Human Rights and the International Queer Identity

The early twenty-first century has seen the rise of a global gay rights movement and a push for international LGBT rights in many parts of the world. International human rights organizations are calling for the application of international human rights principles to LGBT individuals globally. This movement of globalization has located itself in the realm of gay rights, where the internationalization of human rights has become a prime indicator used to evaluate the “progress” of nations (Stychin 2004). The movement has also led to the globalization of same-sex sexualities as identities. This international model of sexual identity, which is inherently Western in essence and ideology, is problematic. As the legal scholar Sonia Katyal notes, “Some cultures view homosexuality as an activity, not an identity” (2002, 99–100). And while there has been an emergence of openly self-identifying gay and lesbian individuals who define their public sexual identity along the lines of their sexual orientations since the late twentieth century, many Western activists and scholars fail to recognize that arguments for legal protection on the basis of sexual orientation often collide with, rather than incorporate, these preexisting social meanings of same-sex sexual activity. In other words, the assumed equivalence between sexual behavior, sexual orientation, and sexual identity, which is dominant in Western law, fails when applied in a cross-cultural framework (Katyal 2002). The idea of a universal paradigm for sexual identity, which then becomes promoted as a universal global human rights fixture, renders all sexual acts, regardless of their motivations, as having similar significance in global civil rights terms. However, imposing a gay, lesbian, or bisexual identity on individuals who may engage in same-sex sexual behavior but “who do not fit a substitutive paradigm between identity and conduct … can be unduly confining [and] exclusionary” (Katyal 2002, 115). And apart from sexual acts having no inherent meaning per se, they “carry different meanings in different cultural and temporal contexts, [and] it is [thus] largely impossible to universalize clear definitions of identity, and the relationship between act and identity is not nearly as ‘fixed’ as the model of gay personhood presupposes” (115). Therefore, focusing on sexual identity–based protections, which are not always palpable to some cultures, can be very limiting and, in many cases, alienates many who do not subscribe to sexual identities but deserve these protections, creating a system of “gay-identity politics [sweeping] the world, like so much of Western commercial culture, but [that] may also prove as repressive and imperial as the old bigotries already in place” (Browning 1998, 28). In the case of Syrian LGBTs, for instance, many choose not to apply for refugee status based on their sexual orientation, as they do not consider themselves to belong under the Western-specific sexual identity of gay, lesbian, bisexual, queer, or other.

Focusing on identity-based protections has thus proven to be an unsuccessful method of attaining equality for sexual minorities. This method of protection is limited when applied in a cross-cultural context, which reveals the inherent contradictions of the global gay rights discourse. In order for the global gay rights movement to succeed and the protection
of sexual minorities to be effective internationally, they must, therefore, take into account sexualities and sexual behaviors outside the traditional categories of sexual orientation and recognize that "many individuals who fall outside of neatly circumscribed categories of sexual identity are just as deserving of a model of liberation that includes them" (Katyal 2002, 100).

As human rights have become an indicator of the progress of nations, gay rights have become a mark of modernity, and the acceptance of gay rights as a mark of embracing modernity, but this acceptance is framed discursively through casting other countries and religions—and, more specifically, Muslim and Arab immigrants to the West—as traditional and backward (Puar 2007; Butler 2008). Western countries are using their status as sanctuaries for LGBT Arabs as a form of sexual exceptionalism, and the liberal gay politics of visibility employed by the West when discussing Middle Eastern LGBT communities, and more recently Arab queer refugees, is ultimately about the “[development of] a righteous critique of power from the perspective of the injured’ (queer) victim, who demands the protection of the benevolent state from the ‘social injury’ of homophobia” (Brown 1995, 27). The only acceptable visible queer Arab is the victim, which is why Judith Butler (2008), among other academics and queer activists who interrogate the “‘Western male white-dominated organizations’ that advocate on behalf of ‘victimized’ queer Arabs” (Ritchie 2010, 558), insists on the inseparability of the queer struggle and the struggle against racism and occupation in order to disrupt the effects of the globalized queer ideology that has labeled the Arab LGBTs as victims and has rendered queer Arabs as “acceptable, and visible, only insofar as they mute or repudiate their [Arabness]” (Ritchie 2010, 562–563).

Employed in the discourse of Syrian LGBT refugees, and queer Arab refugees in general, liberal gay politics of visibility thus renders the Arab, “even on the metaphorical level of sexuality, the victim of the Western phallus” (Lagrange 2000, 189).

The West—specifically the United States, Canada, and Germany—has become a primary destination for individuals applying for refugee status on the basis of their sexual orientation. LGBT Arab refugees, however, and those who work with them, are involved in a system founded on highly malleable, historically and socio-politically specific sexual terms and identities that benefit distinct gendered, classed, and raced interests and, thus, place LGBT Arab refugees, or any refugees from non-North American societies for that matter, in a particularly vulnerable position.
A Middle Eastern Gay Refugee Seeks Refuge in France. A gay refugee named Ismael fills out paperwork in the Marseille office of Le Refuge, a French nonprofit group that provides temporary shelter and support to young adults who have been victimized by homophobia and transphobia. Queer refugees from the Middle East often encounter prejudice from the mainstream Western LGBTQ population because of their nationality.

Sexual Citizenship and Queer Arab Refugees Today

Many queer Arab refugees fleeing persecution in their home countries experience discrimination and trauma in the West as their national identities continue to be regarded as obstacles preventing them from fully integrating into the Western liberal queer community. Queer Arab refugees, and queer Muslims, are gradually coming to the realization that the intersectionality of their sexual orientations with their Arab identities is problematic for them in the West as they encounter prejudice and lack of acceptance from the mainstream Western LGBT population (Gray, Mendelsohn, and Omoto 2015). In addition to navigating these various social spheres, refugees must grapple with potential conflicting pressures to acculturate and assimilate to a specific Western culture (e.g., the American culture), while still maintaining their cultural or ethnic heritage (Gray, Mendelsohn, and Omoto 2015). LGBT Arab refugees are also encountering difficulties interacting with different social groups and communities, for they are often not welcomed or accepted in many ethnic communities. They may be discouraged, then, from accessing the support that might typically be provided to refugees in Arab communities, such as that of family members, or in the LGBT communities, such as that of organizations and nonprofit services, whether on account of the hostility and violence they might have
encountered or as a result of the perception of being unwelcome.

LGBT Arab refugees also face daunting challenges negotiating a system that questions the authenticity of their sexual identity. These questions of legitimacy are constructed by ongoing evaluations of bodily appearances, conduct, and narratives to determine their suitability in Western homonationalist sexual categories (Puar 2007). These modes of evaluation and investigation of the queer refugee’s body across spaces and times create significant challenges for the refugees placed within the determination process (Murray 2014). Queer Arab refugee claimants, then, become classified by the legislators and Western governments as either unworthy claimants or as poor victims begging to be saved from the tyranny of their own cultures, communities, and nations. Sexual-orientation persecution, like gender persecution, as deployed in refugee discourse, can function as a deeply racialized, culturally essentialist concept in that it requires Arab LGBT people to separate their experiences of sexual violence from their experiences as colonized people (Murray 2014). Their application for asylum often entails generating a racist and colonialist discourse that critiques their native state, “while [they participate] in an adjudication process that often depends on constructs of ‘immutable’ identity refracted through colonialist, reified models of culture shorn of all material relations” (Luibhéid 2008, 179). In addition, as mainstream LGBT groups and human rights organizations seek to support queer refugees, they may inadvertently use the refugees’ statements and claims in ways that sustain homonationalist discourses that preserve “a narrow concept of diversity defined in terms of freedom and choice … that not incidentally chime with a neoliberal free market ideology whose inherent exclusions are harder to name” (Haritaworn 2012, 3). Nevertheless, as refugees encounter homophobia and racism in their daily lives in Western countries, the homonationalist discourse will expose the selective dynamics of asylum procedures and interpretations, as well as the role they play in supporting the privileges of neoliberal states (Goldberg 2009). But what is more important is the exclusion of the histories of imperialism, colonialism, and racism from queer refugees’ narratives of sexual identity formation and migration and that “we are not able to see how these systems of domination produce and maintain violence against racialized sexual minorities both within and beyond national borders” (Murray 2014, 29).

**The Future of Queer Arabs Internationally**

The postcolonial is inhabiting global queer space and time. In the countries that were once colonized and oppressed by the same people who are now working to liberate them from the restraints of their cultures and traditions, people are discerning within the global queer discourse the same Orientalist representations of Arab sexuality and myopic chauvinism about the superiority of Western configurations of sexuality. The globalization of Western notions of gay and lesbian identities has thus been met with resistance in postcolonial nations. Western queer ideology is seen as a means of “successfully subordinating Arabs to
foreign Western ‘sexual categories and identities’” (Ritchie 2010, 567). The international pressure to follow such human rights principles does not seem to work, particularly when many in the Arab world see such principles as a Western imposition. The human rights discourse has also proven to be epistemically injurious to Arabs and has been used politically in Israeli and Western democracies to serve ethnonationalist agendas. However, the very emphasis on the lands that were once colonized imposes the binary of us/others, with history continuing to define the past and future and the bodies that once inhabited that space. The continuity of a normative timeline thus becomes interrupted by the increasing weight of the past and the “diminishing future, [which] creates a new emphasis on ... the present” (Halberstam 2005, 2).

The competing demands of queer representations are gradually leading to the shaping of hybrid queer identities. But queer Arabs remain in limbo as they are “shamed locally (when socio-moral codes are publicly violated) and globally (for being too gay or not gay enough). [They] are proverbially damned if they do and damned if they don’t” (Georgis 2013, 242). There is an urgent need for queer Arab refugees to take part in the altering of the Western pride discourse to accommodate them and the emergence of queer Muslim identities in Western societies amid vitriolic political debates on the presence of Islam in the Western world. Thus, queer Arabs and queer Muslims struggle for due recognition from mainstream Western societies and the overwhelmingly secular queer communities. This reveals the limits of liberal multiculturalism, where, in the case of queer Syrians, religion, sexuality, and culture conflict in multicultural capitalist societies. In order for LGBT Syrian refugees, especially Muslim Syrians, to be fully integrated into Western societies, it is necessary for queer Arabs and queer Muslims to be integrated into the normative lives of Muslim and queer communities. Providing the necessary interaction, no matter how miniscule, between Muslims and other subcultures and communities, will lead to the “redefining” of those communities (Hunt 2015). However, queer Arab refugees, Muslim or otherwise, will continue to face challenges in the West as long as the Arab culture and Islam are not integrated into the societies of mainstream Western countries.

LGBT communities residing in the Middle East, who continue to mistrust Western ideologies as mere agendas, regard lesbian and gay Arab refugees as fallen victims to Westernization and foreign influence. The gay identity becomes even more synonymous with Westernization, and gay rights becomes a symbol of recolonization. Gay refugees are viewed as serving Western liberal ideals and as being supporters of Western capitalist values, as they are shown on international media outlets marching in gay pride parades and getting married to partners of the same sex, thereby living the Western dream of being “out” and “proud.” International actors within this discourse promote the model of the globalized queer identity while failing to address whether sexual orientation is considered internationally to be a central aspect of personhood. This is a particularly important question through which people from varying cultures view the intersections between sexual desire, behavior, and identity differently. From the Western queer discourse that
considers international LGBT rights to be part of international human rights came the assumption that increased visibility is a successful formula for combating homophobia, heterosexism, and misconceptions about LGBT people, but such visibility can prove dangerous. Current queer politics present “coming out” as a requirement for queer belonging and frame the discussion of LGBT human rights in the international context that deems a visible coming-out expression of sexual identity essential for the progress of international LGBT rights. That method has proven to be unsuccessful in many postcolonial cultures, because, as a replacement for the relationship between identity, conduct, and expression, queer pride becomes a political instrument in building a community rather than a personal choice. This model of gay civil rights is problematic not only because it relies on an overly constrictive form of identity but also because it alienates the very people such rights are supposed to protect. Many activists and scholars internationally are working to expose the logic of Western queer ideologies as mechanisms that have enabled the reproduction and perpetuation of oppressive and racist ideologies, as well as oppressive patriarchal and heteronormative practices.

But for the time being, queer immigrants seem bound to a constant struggle for identity in the face of the various postcolonial borderlands (Anzaldúa 2012). The Colombian writer Gabriel García Márquez said it best in his acceptance speech for the 1982 Nobel Prize in Literature:

> It is only natural that they insist on measuring us with the yardstick that they use for themselves, forgetting that the ravages of life are not the same for all, and that the quest of our own identity is just as arduous and bloody for us as it was for them. The interpretation of our reality through patterns not our own, serves only to make us ever more unknown, ever less free, ever more solitary.

Human Rights Campaign

VICKI L. EAKLOR
Professor of History (retired)
Alfred University, Alfred, NY

The largest LGBTQ organization in the United States as of 2017.

The Human Rights Campaign, with a reported 1.5 million members and supporters and 150 staff in 2017, is the largest LGBTQ civil rights and political lobbying organization in the United States. Known as the Human Rights Campaign Fund (HRCF) when founded in 1980, it was the first lesbian and gay political action committee operating on a national level. Its original projects were the financial support of lesbian/gay-friendly candidates for public office and soliciting sponsors in the US Congress for a national lesbian/gay rights civil rights bill. (The terms LGBTQ and queer were not yet in use in the movement.) Over the next four decades, the organization grew and changed in terms of issues addressed, as well as staff, members, and activities, but not without struggle and controversy.

Origins

The HRCF was one of several responses, political and cultural, to the growing backlash against the expansion of civil rights and the increased visibility of racial and sexual minorities in the mid-twentieth century. Nonwhite people, women, and gay men and lesbians had made strides toward equality with straight white men in the postwar era while protests against US involvement in Southeast Asia in the 1960s and 1970s became more widespread. These conditions helped foster the rise of the New Right, defined by social and cultural issues and an alliance with the Christian Right. Desegregation, affirmative action, and second-wave feminism (especially the never-ratified Equal Rights Amendment [under consideration for ratification from 1972 to 1982] and the US Supreme Court decision Roe v. Wade [1973]) all came under attack, as did the lesbian/gay movement. In the words of Moral Majority leader Jerry Falwell, “We must stand against the Equal Rights Amendment, the feminist revolution, and the homosexual revolution” (1980, 19).

The backlash against LGBTQ gains appeared in several forms, from antigay legislation to violence. In Florida in 1977, for example, conservatives successfully overturned Dade County’s ordinance prohibiting discrimination based on sexual orientation with the “Save Our Children” campaign. Similar ordinances were repealed in other cities in the next few years. On the national level, Congress introduced legislation (which eventually failed)
denying federal funds to any individual or group perceived as supporting “homosexuality.” The most famous act of antigay violence occurred in 1978 when openly gay San Francisco supervisor Harvey Milk was murdered, along with George Moscone, the city’s mayor. This and the assassin’s light sentence for the murders further sparked lesbian and gay activists to organize on all levels and address politics more specifically.

Among those activists was Minnesotan Steve Endean, who had served as board cochair of the National Gay Task Force (now the National LGBTQ Task Force) and founded the Gay Rights Legislative Committee in his state. In 1978 he arrived in Washington, DC, to direct the Gay Rights National Lobby (GRNL) and soon joined others, including Larry Bye, Jim Foster, and James Hormel, in forming the HRCF and became its first director (1980–1983).

The original aims of the HRCF, officially formed as a political action committee (PAC) in 1980, were to raise funds for supportive candidates and to sign congressional sponsors for a national gay and lesbian rights bill. To facilitate these goals it cosponsored the study “Does Support for Gay Rights Spell Political Suicide?” while establishing the nation’s first gay/lesbian fund-raising network, and in 1980 it also contributed to a congressional candidate (who won, encouraging candidates that such support might not be “political suicide”). Two years later the HRCF held a formal dinner at New York City’s Waldorf Astoria at which former US vice president Walter Mondale spoke. By 1983, however, conflicts in the organization and in the movement over strategies and images contributed to Endean leaving both the GRNL (which merged with the HRCF in 1985) and the HRCF. To some the dinner and Mondale’s appearance looked like progress, whereas others saw elitism in expensive events organized primarily by wealthy white men, causing some to dub the group the “Champagne Fund.” Added to this was criticism of both the GRNL and the HRCF for a sluggish response to the AIDS crisis, adding to the reasons Endean was ousted from both groups’ leadership.

**Challenges of the 1980s**

Vic Basile, known for his work in the civil rights, labor, and antiwar movements, succeeded Endean as executive director and served until 1989. During his tenure the HRCF added activities and personnel and began outreach to the feminist and African American movements. It absorbed the GRNL, and Endean returned to the HRCF in 1986 to run the Fairness Fund (later renamed Speak Out), a mailgram project that added grassroots activity under the newly created Field Division. Also in the late 1980s the HRC Foundation and the Young Leaders Internship Program were created, and the original PAC was now but part of several divisions. However, the HRCF’s image as a collection of wealthy white men continued, seemingly verified by the Insiders Group (later known as the Federal Club), whose members were male, privileged, and white, and whose main contribution was fund-raising by hosting black-tie dinners.
Among the central issues lesbian/gay organizations faced in the 1980s were passage of a national lesbian/gay rights bill and, most prominently, HIV/AIDS. Hearings were held in San Francisco (1980) and in Washington (1982); at the latter, the lesbian activist Jean O’Leary felt she had to state that the rights bill, H.R. 1454, “will not condone homosexuality” (quoted in Feldblum 2000, 164). There was some progress toward passage: all Democratic presidential candidates of 1984 endorsed it, and both the House and Senate reintroduced measures. In 1991 there were 110 cosponsors (Endean 2006), but the HIV/AIDS crisis came to overshadow these gains, and the bill was set aside.

The GRNL had lobbied the federal government for AIDS research funding and education and prevention programs beginning in 1983. Upon the GRNL’s merger with the HRCF in 1985, the AIDS Campaign Trust was formed, and efforts increased toward securing AIDS-related legislation. The HRCF played a key role in the late 1980s in the passage of such bills as the Civil Rights Restoration Act and the 1988 amendments to the Fair Housing Act, as well as increases in AIDS appropriations. It was also in this decade that national lesbian/gay rights groups devoted even more energy to building coalitions with labor, civil rights, feminist, and other lesbian/gay groups; both the National Gay Task Force and the HRCF joined the Leadership Conference on Civil Rights, legislation prohibiting discrimination against people with disabilities included people with HIV/AIDS, and Coretta Scott King spoke at the HRCF’s fifth-annual dinner event in New York City in 1986, declaring her “solidarity with the gay and lesbian movement” (quoted in Saunders 2016). In the meantime, as the historian Marc Stein has written, the HRCF in the 1980s “contributed millions of dollars to hundreds of candidates who supported gay and lesbian rights. This did not come close to the amounts raised and used by sexually conservative political action committees, but it provided an important counterweight” (2012, 174).

The decade’s main issues were addressed by the movement in the National March on Washington for Lesbian and Gay Rights on 11 October 1987, the second of its kind. In 1979 the first National March on Washington for Lesbian and Gay Rights had occurred in October, also to publicize the movement’s major concerns (antigay legislation and violence toward LGBTQ people) and demand action. Concurrently with the 1987 march, the HRCF held the movement’s largest fund-raiser yet. Controversial were the actual number of marchers (a dispute to be repeated with other rights marches, including later LGBTQ marches) and the lack of media coverage. As one result, activists the following year declared 11 October as National Coming Out Day. The first to organize this was the group called the National Gay Rights Advocates, who also supplied a panel for The Oprah Winfrey Show that day. In 1993 the HRCF absorbed National Coming Out Day and broadened it into the National Coming Out Project, soliciting celebrity spokespersons as one strategy for visibility. As a result of the expansion of its mission and activity, the HRCF continued to elicit polarized reactions among activists, from celebration of progress to fears of domination by one organization and its vision of change; by 1989 the HRCF was the largest LGBTQ rights organization in the United States, claiming a membership of 25,000.
New Visions and Old Concerns in the 1990s

The next two executive directors, Tim McFeeley (1989–1995) and Elizabeth Birch (1995–2004), presided during a time that included high hopes, bitter disappointments, and controversy among LGBTQ activists. Under McFeeley, the HRCF continued to build coalitions and focus on AIDS—for example, participating in National AIDS Lobby Days and helping persuade Congress to pass such legislation as the Americans with Disabilities Act (which included protection for people with HIV/AIDS) and the Ryan White Comprehensive AIDS Resources Emergency Act. The HRCF also officially declared itself pro-choice and worked with others on issues involving women’s health and reproductive rights.

During Bill Clinton’s presidential campaign of 1992 he had included lesbians and gay men, especially in his promise to end the military’s policy against homosexuals serving openly. McFeeley was one of several LGBTQ organizational leaders to meet with Clinton in 1993, and the HRCF instituted Operation Lift the Ban, sending over 70,000 messages to Washington as one of its projects. The HRCF and the National Gay and Lesbian Task Force worked together on changing the military policy and other issues, especially in the wake of the movement’s third national march, the 1993 March on Washington for Lesbian, Gay and Bi Equal Rights and Liberation. Yet, the compromise known as “Don’t Ask, Don’t Tell” that went into effect in early 1994 did not remedy the situation and contributed to accusations that the HRCF was ineffectual, resulting in an internal review that generated a plan of action for 1994.

When Birch took over in 1995, “Fund” was dropped from the name, and the HRC adopted the “equal sign” logo. Goals included modernizing the group (going online, hiring professionals, and instituting better marketing techniques), addressing its elitist image, and adding hate crimes legislation and job discrimination to its agenda along with HIV/AIDS; this last item was part of a change in strategy from a national lesbian/gay rights bill to piecemeal protections. In 1994 the Employment Non-Discrimination Act (ENDA) had been introduced in Congress, aided by the HRC’s Documenting Discrimination project, but the bill was defeated in 1996 and no version had passed as of 2017. There was also some outreach to transgendered people, and the HRC had added trans issues by the end of 1998. To some this seemed delayed and contributed to ongoing criticism of the HRC’s projects and focus. Even the support of President Clinton, who spoke at the HRC’s first national dinner and awards ceremony in 1997, could be viewed as either a victory for the movement or a typical example of the group’s “Washington insider” status.

By 2000 the HRC was embroiled in further controversies, first from its endorsement of Alfonse D’Amato, a Republican senator from New York, for reelection—he had voted for ENDA and was against the military antigay policy but was antichoice—then for proposing a march on Washington without consulting diverse movement activists.
What became the Millennium March on Washington for Equality in 2000 had begun as a grassroots movement called Equality Begins at Home with the aim of marching on all fifty state capitals, but occurred as the project of the HRC and others and was announced by those perceived as the movement’s most “top-down” representatives: Birch, Troy Perry of the Universal Fellowship of Metropolitan Community Churches, and the events promoter Robin Tyler.

**Growth and Going Global in the Twenty-First Century**

After 2000 the HRC was deemed effective in responding to the ad campaigns sponsored by the “ex-gay” movement and in expanding outreach and programs such as the fight against discrimination in the workplace. Upon Birch's retirement from the HRC in 2004, Cheryl Jacques became executive director but served less than a year, naming differences with the HRC board as the reason. Joe Solmonese (2005–2012) and Chad Griffin succeeded Jacques, with Griffin still serving as of 2017. The extension of the HRC’s programs and reach is evident in such initiatives as the Religion and Faith Program, introduced in 2005, and Project One America, with its focus on LGBTQ equality in the Deep South (Mississippi, Alabama, and Arkansas), begun in 2014. Workplace equality, health-care issues, and electing pro-LGBTQ candidates at all political levels remained on the agenda, as did the HRC’s efforts toward legalizing same-sex marriage. In the latter case, the group’s long-
standing activism at the state level contributed to the 2015 US Supreme Court decision in *Obergefell v. Hodges* that declared bans on same-sex marriage unconstitutional. (Plaintiff Jim Obergefell was a long-standing HRC member.) As part of its campaign in support of marriage equality, the HRC changed the colors of its logo from blue and yellow to red and pink, and the image went viral on the internet, particularly in Facebook profile photos.

According to its website, the “HRC works to improve the lives of LGBTQ people worldwide by advocating for equal rights and benefits in the workplace, ensuring families are treated equally under the law, and increasing public support around the globe” (HRC 2017). The HRC has indeed expanded beyond the United States, engaging in research, reporting news internationally, and hosting the Global Innovative Advocacy Summit since 2016.

**BIBLIOGRAPHY**

Asia is the largest and most populous continent on Earth. As a result, it includes a vast diversity of cultures and people with dissimilar religious beliefs, social organizations, and political histories. Furthermore, the very concept of “human rights” is highly contested. Asia is often juxtaposed against the “West” and characterized as a region that is authoritarian, overly disciplined, and suffering from a lack of civil liberties. To suggest that all of Asia treats LGBTQ people and sexuality in this manner, however, would be a gross misrepresentation. The treatment of sexuality issues and LGBTQ persons throughout the region differs from community to community and is tied to deep historical and cultural conceptualizations of gender, interactions with cultures from inside and outside the region (including the “West”), and local attempts to recognize and integrate LGBTQ people in a rapidly changing world. The three subregions of Asia discussed here are South Asia, East Asia, and Southeast Asia. The entry is organized along these subregions to capture similar influences, traditions, and histories; as such, human rights is discussed in local terms based on these regional histories.

**South Asia**

The countries of Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, and Sri Lanka constitute the subregion of South Asia. Hindus, Jains, Sikhs, Muslims, Buddhists, and Christians all make their home in the region, demonstrating the deep and rich history of faith in South Asia, with many of these religions originating in the subregion. At the same time, most nations in the subregion were colonized by the British, Portuguese, Dutch, or French or experienced external political pressure on account of the colonization of their neighbors. Although one of the fastest-growing regions in the world, South Asia is still plagued with gross disparity between urban and rural areas. Simultaneously, the region has an incredible diversity of economies, ranging from advanced information- and knowledge-based services to small-scale production and traditional village farming. These historical, cultural, and economic forces all play a role in shaping the rights of LGBTQ people in South Asia. This section looks at the rights of LGBTQ individuals historically from precolonial to colonial times and in the postcolonial age, while also discussing LGBTQ activism and
prospects for the future.

**Precolonial and Colonial South Asia** Over two-thirds of the region practices the religion of Hinduism. The oldest known set of Hindu scriptures, the Rigveda, dating from around 1500 to 1200 BCE, makes no mention of homosexuality. However, ancient religious texts written between the third and sixth centuries CE do make references to homosexuality. The *Kama Sutra* includes an entire chapter on the practice of fellatio between men. Additionally, close to a third of the region practices Islam, which reached the region in the seventh century CE. Although Islamic law explicitly condemns homosexuality, a tradition of homosexual intimacy can be found in the Mughal era and Islamic mysticism (Sufism). Furthermore, records indicate that *hijras*, or those that may be described today as transgendered, have a long history in South Asia. Throughout the region’s history, as opposed to viewing sexuality strictly as a matter of procreation, the ancient literature also discussed sexuality as a source of pleasure. While it should be noted that South Asian LGBTQ history in its full complexity cannot be fully discussed here especially because this history includes a complicated discourse from period to period and from community to community (see Vanita 2002), it can be argued that how sexuality was conceptualized in the region changed dramatically with the introduction of Western colonial power.

Colonial-era legislation idealized the formation of conjugal heterosexual households on the basis of “love marriage” and biological adulthood. In 1860, in response to a number of local practices that challenged British values of the time, the colonial government inserted Section 377 into the Indian Penal Code, a provision that criminalized sodomy and carnal intercourse against “the order of nature.” Furthermore, in 1871, the Criminal Tribes Act was passed to scrutinize and regulate the practices of groups such as hijras. These types of laws transformed the South Asian sexual landscape. First, many of these laws were used to blackmail homosexual political and business rivals. Second, they subjected nonnormative sexualities and expressions of gender to state surveillance and control.

**Postcolonial South Asia** The nationalist movements and subsequent postcolonial projects tended to retain and mimic the values of the colonizer as evidence of a modern and developed nation with self-governing capacity. As nations in the West began to decriminalize same-sex sexual practices, South Asian nations sometimes chose to retain and even enhance similar laws that were inherited through colonization to distinguish themselves as independent nations no longer forced to follow in the footsteps of their former colonizers. Political Islam, an ideology that encouraged the re-Islamization of society through grassroots social and political activism, and that served to mobilize South Asian Muslims to challenge the authority of the British, emphasized a stricter interpretation of religious texts. Heterosexual marriage in the postcolonial context, although historically important, became the only acceptable form of intimate and sexual relationship.
Although Section 377 is still in place in most of the former British colonies of South Asia, such as Pakistan, Bangladesh, and Maldives, and the law serves as the model for similar laws in Bhutan and Sri Lanka, this does not mean that alternative sexual practices have been eliminated in South Asia under threat of law. Personal accounts of sexual activities in major cities of India in the 1970s reveal that, although forced underground, homosexual encounters could easily be found in public parks and buses (Rangayan 2012). Various sources document the presence of alternative sexualities and practices in countries such as Pakistan, despite the presence of such draconian laws (Azhar 2013; Ladly 2012).

Some societies are especially restrictive. Although it has been argued that Buddhism leads to more open and tolerant ideas of sexuality (Stewart 2010), in Sri Lanka, where nearly 70 percent of the population practices Theravada Buddhism, heteronormative versions of the family are promoted in the constitution and homosexual sex is criminalized. In 1999, when gay organizations protested a newspaper editorial stating that lesbians should be raped, the Sri Lanka Press Council ruled that lesbianism was “illegal, immoral, sadistic, salacious, and against Sri Lankan culture, and therefore deserved to be condemned” (quoted in Tambiah 2004, 84). Furthermore, even when laws are passed to recognize LGBTQ community members, such as laws protecting hijras in Pakistan, India, and Bangladesh, their implementation can be problematic. In 2014, after Bangladesh officially recognized hijras as a third gender and pointedly hired twelve hijras for government jobs, eleven of them were subsequently fired because they had penises (Hossain 2017). Thus, official recognition comes with state control, surveillance, and discrimination.

**LGBTQ Activism in South Asia** In spite of these challenges, LGBTQ activism in South Asia is growing. Since the 1970s, a number of LGBTQ individuals in India began to organize, and by the 1990s a number of prominent LGBTQ organizations had begun to seek official recognition from the government. In 2009 one Indian organization successfully petitioned the Delhi High Court, in *Naz Foundation v. Government of NCT of Delhi*, to strike down Section 377, although the ruling was reversed in 2013; in September 2018, India’s Supreme Court ruled that same-sex sexual activity could not be prosecuted under Section 377. In 2017 LGBTQ organizations in Sri Lanka petitioned the government to strike down Sections 365 and 365A of the criminal code—the laws criminalizing LGBTQ acts. Nepal’s Sunil Babu Pant—the first openly gay national-level legislator in Asia—successfully petitioned the Supreme Court to announce that LGBTQ persons are not mentally ill and deserve equal rights under the constitution. Nepal today has some of the best protections for LGBTQ people in the region and in 2017 was described as a “global LGBT rights beacon” (Knight 2017).

Yet not all nations of South Asia are pushing for the same outward recognition of rights, and in some cases where rights are afforded, LGBTQ communities suffer. In 2011 the US embassy sponsored the first gay “pride” festival in Pakistan. Instead of encouraging more Pakistanis to advocate for their rights, this event placed many queer organizations “in the
line of fire” and marked them as Western conspirators (Charania 2017). In India and Bangladesh, adopting the LGBTQ language of the West to become “respectably queer” or to better “serve” marginalized communities has intensified economic and social class, caste, and gender differences.

**East Asia**

The subregion of East Asia includes the countries and territories of mainland China, Hong Kong, Japan, Macau, Mongolia, North Korea, South Korea, and Taiwan. Much like South Asia, the region encompasses vast cultural diversity; simultaneously, however, East Asia has had a deeper penetration of economic development. East Asia contains three of the four “Asian Tigers,” or economies that experienced massive growth from the 1960s onward. These three—South Korea, Taiwan, and Hong Kong—stand today as advanced, high-income, and industrialized economies. Additionally, as of 2018, Japan was the third-largest economy in the world, and China, though still developing, was the second-largest and one of the fastest-growing economies in the world. While economic wealth may bring social change, such change introduces complex interactions between local practices and globalizing norms. Mahayana Buddhism, Confucianism, Taoism, and Shintoism are but a few of the cultural influences on the region. Furthermore, economic growth occurred under strong authoritarian governments, and in response, waves of democratization have transformed some East Asian nations into robust, liberal democracies. However, even with sweeping political changes and economic growth—and some expanded rights for LGBTQ people—much of the region still adheres to strong heteronormative family values, communitarianism, and filial piety. Such social norms can lead to cosmopolitan and modern lifestyles, with alternative sexualities considered shameful and hidden from public. This section looks at the traditional views on homosexuality, the democratization period, and East Asian LGBTQ activism in the twenty-first century.

**Premodern Views on Homosexuality**

Historical records across much of East Asia document awareness of LGBTQ practices. Although Confucianism has been in existence since the sixth century BCE, and Buddhism arrived in the region in the third century BCE, both are vague in their views on sexuality (Stewart 2010). In China, records reveal homoerotic behaviors in the imperial courts as early as the second century BCE (Leupp 1995). Buddhist monks in Japan from the Heian period (794–1185) were reported to engage in same-sex relations, while gay sex was not uncommon in premodern Korea, from the Silla dynasty (57 BCE–935 CE) to the Chosŏn dynasty (1392–1910) (Leupp 1995; Shin 2013). It should be noted that although many of the records discuss male homoeroticism, gender inequality led to lesbianism being ignored (Chou 2000; see also Sang 2003). In Mongolia, however, homosexuality was historically recognized, accepted as normal, and even praised because of the significance of LGBTQ shamans in Mongolia prior to the 1700s (Stewart 2010). In China, attitudes appear to change during the late imperial era. The Manchu
dynasty criminalized sodomy in 1740 CE (Sommer 2000). Furthermore, it has been argued that by the early twentieth century, strong gender binaries and condemnation of “sexual perversions” had been introduced to the region by Western colonial powers (Stewart 2010; Hinsch 1990).

**Modern Era** Throughout much of the subregion, reactions against foreign influence were profound. Japan rapidly modernized following the Meiji Restoration (1868), triggering a militaristic growth that prepared the nation for World Wars I and II. In the first half of the twentieth century, the Chinese Communist Party took control after much political infighting emerged in part as a result of the presence of and competition from foreign influence. The Korean Peninsula, too, experienced conflict between the Soviet-backed north and US-backed south. By the early 1950s, the region was ravaged by war, economically in shambles, and politically weak. Strong authoritarian leaders emerged in South Korea and Taiwan to prioritize order and growth over freedom. China entered the Cultural Revolution period, purging itself of Western “decadence and promiscuity” such as homosexuality. Japan initiated an ambitious phase of industrialization and export-led growth. After three decades, Japan had grown into the third-largest economy in the world.

By the beginning of the twenty-first century, much of East Asia had grown economically robust, with laws playing down tradition and promoting economic growth and mobility. China removed communist-era laws criminalizing homosexuality. In Hong Kong and Macau, the British and Portuguese penal codes were amended (in 1991 and 1996, respectively) to remove clauses criminalizing gay male sex. In South Korea, since the 2001 passage of the National Human Rights Commission Act, discriminatory acts on the grounds of sexual orientation have been considered as violating one’s right to equality. Democratization movements in the late 1980s transformed Taiwan into a liberal and progressive state, leading many to believe it may be the first in East Asia to allow for gay marriage. Yet these changes have yet to transform the social status of LGBTQ persons in East Asia. Although gay marriage was discussed in Taiwan as early as 2003, this triggered a political backlash with politicians engaging in hate speech against the LGBTQ community (Yu-Rong and Wang 2010). In Hong Kong, because of homo-prejudice, many gay and lesbian individuals conceal their sexuality from friends, employers, and family. Although homosexuality is not illegal in China, South Korea, or Japan, and LGBTQ rights are constantly expanding, heteronormative expectations of marriage and children, along with strong filial piety expectations, force LGBTQ people to hide their feelings and prioritize social obligations over individual desires.

**LGBTQ Activism in the Twenty-First Century** Notwithstanding East Asia’s heteronormative rigidity from the early twentieth century onward, LGBTQ rights have been advancing thanks to a large number of dedicated individuals willing to contravene strict societal norms. In Japan, lesbians were the first to organize social groups starting in the 1970s. By the mid-1980s, as a result of the influence of Western LGBTQ movements, the LGBTQ community in Japan became more visible, issuing publications, organizing gay film
festivals, and putting on the first lesbian and gay pride parade, in 1994. In China, Li Yinhe, a scholar and LGBTQ rights activist, proposed the Chinese Same-Sex Marriage Bill in 2003 and, after it failed, reintroduced it again in 2005, 2006, and 2008. Activists in Mongolia and Macau are pushing for greater recognition of the LGBTQ community by petitioning the government for official registration of LGBTQ nongovernmental organizations. Finally, although Mongolia and Taiwan have laws allowing for transgender people to change their sex on official documents after sexual reassignment surgery, South Korea allows transgender people to change their sex on such documents without undergoing surgery. In Hong Kong, the landmark 2013 case *W v. Registrar of Marriages* declared that transgender people have the right to marry as their identified gender rather than their biological sex at birth.

**Southeast Asia**

This subregion is arguably the most dynamic in Asia, sharing both the dramatic economic growth of East Asia and the overt colonial past of South Asia. The subregion includes Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, the Philippines, Singapore, Thailand, and Vietnam. Culturally, the subregion embodies great diversity, having traded and shared cultures with the major powers of Asia and Europe. Its inhabitants speak over 800 languages and practice almost all of the major world religions. The subregion’s legal systems are equally varied, with many nations crafting different laws to apply to their diverse communities. In this subregion, LGBTQ rights have been slow to materialize but also have great potential given the subregion’s vibrant diversity and hybridization of cultures from past to present. This final section reviews the subregion’s precolonial and colonial histories, “Asian values” and globalization, and, finally, LGBTQ activism in the twenty-first century.

**Sexuality in Precolonial and Colonial Southeast Asia** Deeply entrenched and broadly institutionalized traditions of pluralism with respect to gender and sexuality have existed in Southeast Asia since the early modern era. When the Portuguese, Dutch, Spanish, British, and French arrived between the seventeenth and nineteenth centuries, they found such gender norms confusing and unruly. The British subsequently passed Section 377, prohibiting sex against the “order of nature” in Brunei, Malaysia, Myanmar, and Singapore—with Singapore eventually also implementing Section 377A, a code specifically targeting gay males. In colonial Philippines, there is evidence that the Spanish decreed that sodomites be sentenced to death by fire. Additionally, the Spanish replaced the *babaylans*, or transgendered religious figures, with *datus* (heads of clan) as village leaders. While the French and the Dutch had less interventionist policies to deal with sexual plurality, they nevertheless saw it as a threat to European racial purity and public health.

Upon the departure of Western colonial powers from the region after World War II, borders were in flux, internal conflicts along racial and political lines erupted, and global
ideological battles (i.e., capitalism versus socialism) swept the region. National movements in Indonesia prioritized family and traditional values as the galvanizing, postcolonial force behind nation building. Vietnam, Cambodia, and Laos turned to “high modernity” through socialism, expunging themselves of traditional and French colonial laws. The British colonies of Brunei, Burma, Malaysia, and Singapore all maintained their British laws and, in some cases, emboldened them with stronger penalties, particularly in the area of sexuality.

“Asian Values” and Globalization Experiencing dramatic economic growth, and in reaction to Western colonization, Southeast Asian nations began to push back against the human rights discourse. Political leaders, such as Singapore’s Lee Kuan Yew (1923–2015) and Malaysia’s Mahathir Mohamad (1925–), asserted that the Western obsession with individual rights and “moral decadence” were inappropriate for Asia. Many Southeast Asian countries therefore emphasized their “traditional cultures” and fought off Western individualism, of which LGBTQ rights were seen as a manifestation. In Indonesia, the family in particular was used by the New Order government as the fundamental building block of society, and by the 1980s and 1990s this heteronormative structure became increasingly exploited to marginalize LGBTQ identities. Even in Thailand, a state that has relatively liberal views on sexuality, when a Thai teacher’s college upheld its decision to ban gay teachers, the Thai minister of education refused to intervene, stating that “under no circumstances … would the ‘rights’ of individuals be permitted to undermine the security of the collective body” (quoted in Morris 1997, 54).

Yet the tension between globalizing norms, the changing economy, and political rhetoric led to changes in the way the state treated LGBTQ rights at the beginning of the twenty-first century. Some Southeast Asian nations began recruiting the “pink dollar” (purchasing power of the LGBTQ community), aggressively luring foreign talent from “liberal” Western nations, and playing down the “Asian values” discourse. Singapore in 2003 allowed LGBTQ people to openly serve in civil service positions and in 2009 had its first “Pink Dot” event to celebrate LGBTQ people. Vietnam in 2012 began debates on same-sex marriage and in 2015 began to allow ceremonial, though legally invalid, same-sex weddings. In 2010 Myanmar began its transition to a civilian government, with concomitant legal reforms and liberalization, as well as a budding LGBTQ rights movement. Not all countries are progressing smoothly or in the same direction. Brunei enhanced its colonial-era laws criminalizing sodomy by changing the penalty from ten years’ imprisonment to death by stoning. In Malaysia, the political opposition leader Anwar Ibrahim (1947–) was prosecuted, convicted, and imprisoned several times for sodomy in what appeared to be politically motivated gestures. Finally, in Thailand, reports still surface of parents killing homosexual children and of gay conversion therapy tactics, such as raping lesbians or sending gay males to the monastery to become more “manly.”

LGBTQ Activism in the Twenty-First Century In spite of the difficulties, LGBTQ activism remains strong in the region. In 2013 Section 377A was challenged in Singapore’s High
Court. Although it was ultimately upheld, the ruling opened the door for future constitutional challenges. In Myanmar, LGBTQ activists work hard to translate the meaning of “rights” into the vernacular language after so many years of military rule. Finally, activists in the Philippines formed Ladlad, the first LGBTQ political party in the Philippines, and the only existing LGBTQ political party in the world, to challenge deep-rooted institutional bias in Philippine politics. Concomitantly, Indonesia and Malaysia have seen an increase in the policing and public shaming of “effeminate” men. In 2017 Indonesia issued “socialization orders,” forcibly arresting, detaining, and expelling gays and lesbians from major cities. While Southeast Asia grapples with finding its own path in the modern world and eschewing the consequences of its colonial past, political activism is still a balancing act between pushing for individual rights and avoiding tactics that might antagonize the state or populations that still embrace the “Asian values” discourse.

As an incredibly diverse region, Asia resists generalizations, particularly when it comes to the contentious issue of “human rights.” It is clear, however, that LGBTQ people have made significant strides throughout the region in making their voices heard and in pushing for greater recognition. Such strides are not without challenges, however. From political hurdles of authoritarian or military governments and cultural influences of religion or "Asian values" to fast-paced yet unequal economic development, LGBTQ activists have had to overcome a plethora of obstacles in making Asia a safe place for the members of their communities to live on an equal footing with non-LGBTQ people. For better or worse, such progress will have to be made over time and—learning from the past—on homegrown terms and in response to local circumstances to be successful.

BIBLIOGRAPHY

**FILMOGRAPHY**

“Europe” is best understood in terms of political and legal organization as an inner and a larger outer circle of countries. All member countries of the inner circle are also members of the outer circle. The inner circle (twenty-eight countries as of 2017) is the European Union (EU). These countries are bound by the provisions of the successive treaties that make up the constitution of the EU. Although primarily concerned with economic issues, the EU has increasingly become concerned with human rights, such as the right to equality and privacy. The EU “legislates” through the creation of Regulations, which are directly enforceable in member states, and Directives, which member states must legislate to implement. The supreme court of the European Union is the Court of Justice, which is part of the entity known as the Court of Justice of the European Union. The Court of Justice, which sits in Luxembourg, is often referred to as the European Court of Justice.

The outer circle is the Council of Europe, which includes forty-seven countries as member states. The Council of Europe “legislates” by drafting treaties that member states may decide to become bound by. The most important of these treaties is the European Convention on Human Rights, which is legally binding on all member states of the Council of Europe. This Convention is primarily concerned with human rights, such as freedom of speech, privacy, and nondiscrimination. The supreme court of the Council of Europe is the European Court of Human Rights. It sits in Strasbourg, France.

**THE EUROPEAN PARLIAMENT**

The European Parliament is the legislative body of the European Union. It should not be confused with the Parliamentary Assembly (formerly known as the Consultative Assembly) of the Council of Europe, although both bodies meet in Strasbourg, France. The European Parliament’s role regarding human rights is limited by the fact that it does not initiate legislation (which is done by the Commission of the European Union), and the legislation that it does participate in is limited to matters within the competence of the European Union, which do not include criminal law. The Parliament
adopted a Holocaust resolution in 2005 that condemned the murder of homosexuals in Auschwitz-Birkenau and warned of the danger of victimizing people for their sexual orientation. Within the Parliament the Intergroup on LGBTI Rights is an informal forum for over 150 members of the European Parliament. It has five priorities for its work: freedom of movement for LGBT people, monitoring the European Commission, combating discrimination in the European Union, securing transgender and intersex rights, and monitoring human rights in the work of the European Union.

The Parliamentary Assembly of the Council of Europe (PACE) has no legislative function, although it is very active in all areas of human rights and elects the judges of the European Court of Human Rights. On 16 May 2017, on the eve of the International Day against Homophobia, Transphobia, and Biphobia, Jonas Gunnarsson, PACE’s general rapporteur on the rights of LGBTI people, issued a statement in support of the LGBTI community: “Recent allegations of wide-scale abductions and torture as well as extrajudicial killings of LGBTI people in Chechnya highlight more than ever the urgent need to protect victims of homophobic and transphobic violence and end the impunity of perpetrators.”

Formation of the European Union and the Council of Europe

The reason for the existence of these two supreme courts in Europe is as much history as logic. After World War II (1939–1945) there was a growing consensus among nations that something should be done to prevent another war in Europe and to prevent abuses of human rights such as those under the Nazis. Initially, this took the form of a movement for European unity, formally discussed at the Congress of Europe in The Hague in the Netherlands in 1948. The movement soon divided.
One group of states was primarily concerned with preventing another European war by establishing international control of the primary means of industrial production through the creation of the European Coal and Steel Community in 1951. This was followed by the establishment, both in 1958, of the European Atomic Energy Community and the European Economic Community, the latter of which evolved into the European Union. The primary aim of the European Union is the facilitation of the free movement of goods, capital, services, and labor between member states.

The major human rights component of EU law for many years was the prohibition of sexual discrimination in employment. This did not initially include discrimination on the grounds of sexual orientation. That was added, along with an expansive catalog of rights, in the Charter of Fundamental Rights of the European Union, which came into force in 2009 through the Treaty of Lisbon. Most EU legislation and case law regarding LGBTQ rights have been concerned with employment and related subjects, such as pensions.

The other group of states, including all those in the first group, was concerned with protecting human rights and democratic values. It began by creating the Council of Europe, the title given to the group of states that agreed in 1949 to abide by the Statute of the Council of Europe. This committed signatory states to guarantee democracy and fundamental human rights. The Council of Europe then began to draft treaties, the first of which was the European Convention on Human Rights (ECHR; officially called the Convention for the Protection of Human Rights and Fundamental Freedoms). This treaty established machinery for the implementation of rights, including the European Court of Human Rights. At present, individuals who feel that a state has violated their rights under the Convention can complain to the European Court of Human Rights, and states are bound to follow the rulings of the court.

The two provisions of the European Convention on Human Rights most relevant to LGBTQ rights are the right to privacy (in Article 8) and the right not to be discriminated against (in Article 14). The right to privacy has been significant in striking down laws penalizing same-sex acts and recognizing transsexual identity. The nondiscrimination right in Article 14 does not expressly include sexual orientation as a prohibited ground, but it has been adopted by interpretation. The right to marry and found a family (in Article 12) is relevant to LGBTQ rights, but the European Court of Human Rights has not yet ruled that this includes a right to same-sex marriage.

**LGBTQ Rights in Europe before the ECHR and EU**

Prior to the nineteenth century, homosexual acts were crimes subject to the death penalty in most European states. France was the first western European country to decriminalize homosexual acts between consenting adults when, in 1791, the revolutionary government adopted a new penal code that no longer criminalized sodomy.
During the nineteenth century, the persecution of LGBTQ individuals changed from a moralistic and punitive model to a medical model. Deviation from the sexual norm was perceived as an illness rather than evil. There was a great deal of speculation about whether this “illness” was the result of nature or nurture. The debate was far from theoretical, because the etiological theory chosen indicated the societal response. If it was a condition from birth, then the response would be medical treatment, which could be through drugs or surgery. If it was the result of environmental conditioning, then it could be “cured” by various changes in environment.

In Germany in 1897 the sexologist Magnus Hirschfeld (1868–1935) cofounded the Wissenschaftlich-humanitäres Komitee (Scientific-Humanitarian Committee) to campaign against Paragraph 175 of the penal code, which made sex between men illegal. This was the first public gay rights organization in Germany. In 1919 he also cofounded the Institut für Sexualwissenschaft (Institute for Sexual Science), a private sexology research institute. The first gay demonstration, with about 400 people, took place in Nollendorfplatz in 1922 in Berlin.

In post–World War II Europe, national laws regarding homosexuality were often changed as a result of internal campaigning and reform. But many laws regarding LGBTQ rights resulted from rulings by the European Court of Human Rights under the European Convention on Human Rights. Dating from 1950, it is the best-known treaty from the Council of Europe, the larger and older of European institutions, not to be confused with the smaller and younger European Union. Both the Council of Europe and the EU have been active in formulating LGBTQ rights.

Although the two courts are often confused, sometimes even by lawyers, the European Court of Human Rights in Strasbourg and the European Court of Justice in Luxembourg are very different. The European Court of Human Rights was created by the European Convention on Human Rights, which was promulgated by the Council of Europe, the older, larger, and legally less directly controlling European institution in comparison with the EU. The European Court of Human Rights considers complaints from those who believe that their Convention rights have been violated, after exhausting all national legal appeals. The European Court of Justice is the supreme court of the EU. Its usual procedure is to consider requests for advice on EU law from national courts at all levels and to advise the national court on how to apply EU law. This advice, on subjects such as the inclusion of transsexuals under EU sex discrimination law, must be followed by the court that requested the advice and is highly persuasive on courts in other EU countries. It is the equivalent of rulings by the US Supreme Court.

**European Court of Human Rights LGBTQ Cases**

**Cases Involving Criminal Law and Humane Treatment** The LGBTQ case law under the
European Convention on Human Rights is mostly about the Article 8 right to private and family life, the Article 12 right to marry, and the Article 14 right not to be discriminated against, while some cases involve the Article 3 right not to be subject to inhuman or degrading treatment and the rights to freedom of speech and assembly in Articles 10 and 11. In 1981 in the landmark case of *Dudgeon v. United Kingdom* the European Court of Human Rights held that Article 8 was violated by a Northern Ireland law making male homosexual acts crimes. The applicant had not been convicted, but as a homosexual he was a victim by the very existence of the law. In 1988 in *Norris v. Ireland* the court also held that there had been a violation of Article 8 of the Convention by the law in the Republic of Ireland. In the 1993 case of *Modinos v. Cyprus* the court also held that the law in Turkish-occupied Northern Cyprus violated Article 8. The court began by ruling that laws penalizing homosexuals violated the right to privacy and then began to find that they also violated the right not to be discriminated against, even though sexual orientation is not one of the specifically prohibited grounds for discrimination in Article 14.

**THE HOLOCAUST AND LGBT VICTIMS**

While gays and lesbians had been socially marginalized well before Adolf Hitler came to power as leader of the Nazis in Germany in 1933, persecution of them intensified in the following years. Under the Nazis, organizations such as Magnus Hirschfeld's Institut für Sexualwissenschaft were banned, and in 1933 all the books in the institute's library were publicly burned. The Reichszentrale zur Bekämpfung der Homosexualität und Abtreibung (Reich Central Office for Combating Homosexuality and Abortion) was created in 1936, and large numbers of homosexuals began to be arrested. In July 1940 the Nazi leader Heinrich Himmler declared that all men convicted for homosexual acts and known to have had more than one partner should be sent directly to a concentration camp, although the Gestapo had been rounding up men since the late 1930s. In November 1942 an SS (Schutzstaffel [Protection squadron]) decree gave concentration camp commandants the power to order the castration of homosexual prisoners, although castrations had been carried out against sexual offenders, including homosexuals, as early as 1935 on the basis of the Law against Dangerous Habitual Criminals and Sex Offenders.

In concentration camps homosexual men were identified by a pink triangle, while some wore a green triangle as ordinary criminals. Lesbians were not persecuted formally, although some wore a black triangle as asocials for failure to conform to gender norms. Some were subjected to medical experiments. Between 1933 and 1945 about 100,000 men were arrested, with as many as 50,000 serving time in jails and prisons, and 5,000 to 15,000 were sent to concentration camps. In the camps only about 4,000 survived. At the 1945 Nuremberg war crimes trials no mention was made of crimes against homosexuals. The Federal Law for the Compensation of the Victims
of National Socialist Persecution of 1956 declared that men held in concentration
camps as homosexuals were not qualified to receive compensation. There was little
recognition of LGBT victims of the Holocaust until the 1970s, and it was only in 2002
that the government of Germany issued a formal apology for the Nazi persecution of
homosexuals.

In the United Kingdom the Sexual Offences Act in 1967 removed criminal penalties for
homosexual acts in private by males over the age of twenty-one. In 1994 the age of consent
for male homosexual acts was lowered to eighteen, while the age of consent for
heterosexual acts was sixteen. The case Sutherland v. United Kingdom was filed in 1994,
arguing that the difference in the age of consent was discrimination in violation of Article
14. The British government agreed to lower the age of consent for male homosexual acts to
sixteen. This was done in 2001, and a friendly settlement between plaintiff and the United
Kingdom was approved by the court.

The European Court of Human Rights has decided several cases involving the treatment of
LGBTQ people that amounted to violations of the right to life and the prohibition of
inhuman or degrading treatment (Articles 2 and 3). Identoba v. Georgia (2015) centered on
a demonstration held in May 2012 on the International Day against Homophobia,
Transphobia, and Biphobia that was violently disrupted by counterdemonstrators. The
court ruled that the Georgian government’s failure to protect against violent attacks and
effectively investigate them violated Articles 3 (torture) and 14 (discrimination). In 2012
the court found in X. v. Turkey that the solitary confinement for over eight months of a
homosexual prisoner had not been for his protection but because of his sexual orientation,
violating Articles 3 (torture) and 14 (discrimination). In the 2016 case of O.M. v. Hungary
the court ruled that detaining a gay Iranian man who applied for asylum for two months
violated his Article 5 right to liberty. The court has come close to deciding that the
Convention would be violated if ill-treatment was likely to result from the return of
homosexuals to their country of origin. The court was still deliberating *M.E. v. Sweden* in 2015 when the Swedish Migration Agency found that if a homosexual was deported to Libya he would be at risk of persecution.

**Cases Involving LGBTQ Gender Identity Rights** At first the European Court of Human Rights rejected claims by transsexuals, but it gradually has come around to the view that a refusal to recognize gender identity violates the European Convention on Human Rights. The court has modified its interpretation regarding gender identity in a series of cases from the *Rees* case to the *Christine Goodwin* case. In *Rees v. United Kingdom* (1986), the court found no breach of Article 8 (privacy) when a female-to-male transsexual was refused legal recognition of his condition. The court also found no breach of Article 12 (right to marry) because traditional marriage was defined as being between persons of different biological sexes. In *Cossey v. United Kingdom* (1990) the court repeated its ruling in *Rees*.

But in *B. v. France* (1992) the court found a breach of Article 8 (privacy) in the refusal of French authorities to amend the civil-status register to recognize a male-to-female transsexual, distinguishing from *Rees* and *Cossey* by differences between the British and the French civil status systems. In the United Kingdom there was less expectation that records such as birth certificates would be updated, but the French system allowed for records to be updated throughout a person’s life, establishing an expectation that the civil-status register would be updated for everyone, including transsexuals.

In *Sheffield and Horsham v. United Kingdom* (1998) the court was not persuaded that it should depart from its *Rees* and *Cossey* judgments. It said that “transsexualism raises complex scientific, legal, moral, and social issues, in respect of which there is no generally shared approach among the Contracting States.” The court held that there had been no violations of Articles 8 (privacy), 12 (right to marry), or 14 (discrimination) but reaffirmed that the area needs to be kept under permanent review by the Contracting States in the context of increased social acceptance of the phenomenon and increased recognition of the problems that postoperative transsexuals encounter.

But in *Christine Goodwin v. United Kingdom* (2002) the stance of the European Court of Human Rights changed from previous rulings. The court held that there was a violation of Article 8 (privacy) by the lack of legal recognition of Goodwin’s changed gender in terms of employment and social security, owing to a clear and continuing international trend toward increased social acceptance of transsexuals and toward legal recognition of the new sexual identity of postoperative transsexuals. The court also found a violation of Article 12 (right to marry), saying that it was for the state to determine the conditions and formalities of transsexual marriages but that it “finds no justification for barring the transsexual from enjoying the right to marry under any circumstances.” While the state could regulate the formalities of marriage, it could not impose a complete ban on marriage by transsexuals.
Following *Christine Goodwin*, the United Kingdom introduced a system whereby transsexuals could apply for a gender recognition certificate. Two later cases concerned transsexuals who were married before the sex reassignment surgery and who wanted to make use of this gender recognition procedure. In *Parry v. United Kingdom* (2006) and *R. and F. v. United Kingdom* (2006) the applicants were married and had children, respectively. In each case, one of them underwent gender reassignment surgery and remained with his or her spouse as a married couple. Following the enactment of the Gender Recognition Act of 2004, which was passed to comply with the 2002 ruling in *Goodwin*, the applicants, who had undergone gender reassignment surgery, made an application for the issue of a gender recognition certificate, which could not be obtained unless they terminated their marriage. The applicants complained in particular under Articles 8 (privacy) and 12 (right to marry) that they had been unable to obtain legal recognition of their acquired gender without terminating their marriage.

The court declared the applications inadmissible. The applicants were requested to annul their marriage because same-sex marriages were not permitted under English law. The United Kingdom had given legal recognition to gender reassignment, and the applicants could continue their relationship through a civil partnership, which carried almost all the same legal rights and obligations. The court observed that when the new system was introduced following the *Christine Goodwin* judgment, the legislature was aware that there were a small number of transsexuals in existing marriages but deliberately made no provision for those marriages to continue in the event that one partner made use of the gender recognition procedure. The court found that it could not be required to make allowances for that small number of marriages. This is an example of the European Court of Human Rights' reluctance to interfere with what it regards as the details of national laws on marriage.

In *Grant v. United Kingdom* (2006) the applicant, a sixty-eight-year-old postoperative male-to-female transsexual, successfully complained about the lack of legal recognition of her change of gender and the refusal to pay her a retirement pension at the age applicable to other women (sixty). The court held that there had been a violation of Article 8 (privacy). She had been a victim of the lack of legal recognition from the moment after the *Christine Goodwin* judgment when the authorities had refused to give effect to her claim, namely from 5 September 2002, until the Gender Recognition Act of 2004 entered into force. This lack of recognition had breached her right to respect for her private life. The refusal of health insurers to pay for the sex-change operation for a sixty-seven-year-old person because she had not complied with a two-year waiting period violated Article 8 (privacy) in *Schlumpf v. Switzerland* (2009).

In *Hämäläinen v. Finland* (2014) the court held that it did not violate Article 8 (privacy) to require the conversion of a marriage into a registered partnership as a precondition to legal recognition of an acquired gender because it would provide legal protection for same-
sex couples that was almost identical to that of marriage. The applicant was born a male, married a woman and had a child with her, and then underwent male-to-female gender reassignment surgery. She could have her identity changed to female in her official documents only if her wife consented to turn the marriage into a civil partnership or if they divorced. The court also found that there had been no violation of Article 14 (discrimination).

Cases Involving Same-Sex Marriage and Civil Union Rights Although the European Court of Human Rights had yet to recognize a right to same-sex marriage as of 2017, many European countries had already done so. The first country was the Netherlands (2001). By the end of 2017, same-sex marriages were legal nationally in fifteen European countries: the Netherlands, Belgium (2003), Spain (2005), Norway (2009), Sweden (2009), Iceland (2010), Portugal (2010), Denmark (2012), France (2013), the United Kingdom (2014), Luxembourg (2015), Ireland (2015), Finland (2017), Germany (2017), and Malta (2017). In addition, same-sex marriages were set to become legal in Austria at the beginning of 2019. The European Court of Human Rights sometimes seems to wait for an emerging consensus among Council of Europe states before changing its rulings.
In the 2010 case of Schalk and Kopf v. Austria the court ruled that the European Convention on Human Rights did not require a state to grant a same-sex couple access to marriage. The applicants were a same-sex couple living in a stable partnership, and the refusal of the Austrian authorities to grant them permission to marry was upheld by the courts. The European Court of Human Rights found no violations of Articles 12 (right to marry) or 14 (discrimination) and said that national authorities were best placed to assess and respond to the needs of society in this field, given that marriage had deep-rooted social and cultural connotations differing greatly from one society to another. In 2016 the court repeated that ruling in Chapin and Charpentier v. France but noted that France had granted same-sex couples access to marriage in 2013, and the applicants were therefore free to marry.

Although the court had yet to decide that there is an LGBTQ right to marry as of 2017, it had decided several cases involving LGBTQ people and civil unions. In Vallianatos v. Greece (2013) the court held that it was a violation of Articles 14 (discrimination) and 8 (privacy) for the Greek law of 2008 to provide for civil unions only for different-sex couples, automatically excluding same-sex couples. The court noted that of the nineteen state parties to the Convention that authorized some form of registered partnership other than marriage, Lithuania and Greece were the only ones to reserve it exclusively to different-sex couples. In Oliari v. Italy (2015) the court held it was a violation of Article 8 (privacy) that under Italian law same-sex couples had no option to get married or enter into any other type of civil union. The court noted that twenty-four of the forty-seven Council of Europe member states gave some legal recognition of same-sex couples, that the Italian Constitutional Court had repeatedly called for recognition, and that, according to surveys, a majority of the Italian population supported legal recognition of homosexual couples. In Salgueiro da Silva Mouta v. Portugal (1999) the European Court of Human Rights held that it was a violation of Article 14 (discrimination) and Article 8 (privacy) for the Portuguese courts to prevent a homosexual man living with another man from visiting his daughter, in breach of an agreement reached at the time of his divorce. The Portuguese courts’ decision—on a finding that “the child should live in a traditional Portuguese family,” which forced him to hide his homosexuality when seeing his daughter—was based on considerations relating to sexual orientation not acceptable under the Convention.

The court has been consistent in its rulings on residence rights and has decided two cases upholding the right of same-sex alien partners to residence permits. The 2016 case Pajić v. Croatia involved a national of Bosnia and Herzegovina who was in a stable same-sex relationship with a woman living in Croatia and was refused a residence permit in Croatia. The Croatian Aliens Act reserved the possibility of applying for a residence permit for family reunification to different-sex couples. The court held that there had been a violation of Article 14 (discrimination) taken together with Article 8 (privacy). It found that the applicant had been affected by a difference in treatment between different-sex couples and
same-sex couples. In Taddeucci and McCall v. Italy (2016) the court held that Italy’s immigration law violated Articles 14 (discrimination) and 8 (privacy) by refusing a family member’s residence permit to unmarried partners. The gay couple, one Italian and the other from New Zealand, could not live together in Italy because the Italian authorities refused to issue the second applicant with a residence permit on family grounds. The court found that the gay couple could not be understood as comparable to an unmarried heterosexual couple because they could not marry or, at that time, obtain any other form of legal recognition. The court ruled that treating homosexual couples in the same way as unmarried heterosexual couples breached the right not to be subject to discrimination based on sexual orientation.

**Cases Involving LGBTQ Social Rights** The European Court of Human Rights thus has evolved in its case law to recognize transsexual identity but has not yet recognized a right to same-sex marriage. In same-sex relationships the court has given recognition to residence rights and is beginning to give some recognition to social rights, such as pensions. Beyond gender identity, marriage, and residency, there have been several cases involving LGBTQ people and various social rights. In Mata Estevez v. Spain (2001) the court effectively upheld discrimination. The applicant complained about the difference in treatment for a survivor’s pension between de facto homosexual partners and married couples. The court rejected the application as manifestly ill-founded, finding that Spanish legislation relating to eligibility for survivors’ allowances pursued a legitimate aim (the protection of the family based on the bonds of marriage) and that the difference in treatment could be considered to fall within the state’s margin of appreciation. But in P. B. and J. S. v. Austria (2010), the court found a violation in the refusal to extend sickness insurance coverage to the homosexual partner of an insured person. Before a legislative amendment in July 2007, Austrian law provided that only a close relative of the insured person or a cohabitee of the opposite sex qualified as dependents. The court held that there had been a violation of Article 14 (discrimination) in conjunction with Article 8 (privacy). An amendment making the law neutral regarding the sexual orientation of the cohabitee put an end to the violation.

In Manenc v. France (2010) the court approved the refusal of a reversionary pension to the survivor of a civil partnership between two people of the same sex on the ground that the requirement of a lawful marriage had not been met. The court found that the French legislation on survivors’ benefits pursued a legitimate aim (the protection of the family based on the bonds of marriage) and that limiting the legislation to married couples, to the exclusion of partners in a civil partnership regardless of their sexual orientation, fell within the broad margin of appreciation accorded to the states by the European Convention on Human Rights. The court ruled the application inadmissible.

In Aldeguer Tomás v. Spain (2016) the applicant was denied a survivor’s pension following the death of his partner, with whom he had lived in a de facto marital relationship. The
applicant had been unable to marry his partner under the law in force during the latter's lifetime. Three years after his partner's death, the law legalizing same-sex marriage in Spain entered into force. The court held that there had been no violation of Article 14 (discrimination) in conjunction with Article 8 (privacy) and Article 1 (property) of Protocol No. 1 to the Convention, finding that there had been no discrimination in the applicant's case. In particular, his situation following the entry into force of the law legalizing same-sex marriage in Spain in 2005 was not the same as that of a surviving partner of a heterosexual cohabiting couple, who had been unable to marry before the law legalizing divorce entered into force in 1981 and who qualified for a survivor's pension by virtue of a provision of that law. Moreover, states had, at the relevant time, a margin of appreciation regarding the timing of the introduction of legislative changes in the field of legal recognition of same-sex couples and the exact status conferred on them, an area that was regarded as one of evolving rights with no established consensus.

The court held that there had been a violation of Articles 14 (discrimination) and 8 (privacy) in Karner v. Austria (2003) by the Austrian Supreme Court's decision not to recognize the right of the applicant to succeed to a tenancy after the death of his companion, which was discrimination on the ground of his sexual orientation. In Kozak v. Poland (2010), following the death of his homosexual partner, the applicant claimed to be entitled to succeed to the tenancy of a council flat that was in his partner's name. In dismissing his claim, the Polish courts found that the applicant had moved out of the flat and stopped paying rent before his partner's death and that, in any event, a de facto marital relationship, which was a prerequisite for succession to the tenancy of a council flat, could exist only between persons of the opposite sex. The European Court of Human Rights held that there had been a violation of Article 14 (discrimination) in conjunction with Article 8 (privacy). Given the state's narrow margin of appreciation in cases of difference in treatment on the basis of sexual orientation, a blanket exclusion of persons living in a homosexual relationship from succession to a tenancy could not be considered acceptable. These cases show that combining property rights with rights to privacy and nondiscrimination appeared to be persuasive to the court.

Cases Involving Adoption Although as of 2017 the court had not yet recognized a right to same-sex marriage, it did come close to recognizing a right to adopt in several cases involving LGBTQ people wanting to adopt. In Fretté v. France (2002), a homosexual man complained that the decision dismissing his request for authorization to adopt a child amounted to arbitrary interference with his private and family life because it was based exclusively on unfavorable prejudice about his sexual orientation. The court held that there had been no violation of Article 14 (discrimination) in conjunction with Article 8 (privacy). It found that the national authorities had been legitimately and reasonably entitled to consider that the right to be able to adopt, on which the applicant had relied, was limited by the interests of children eligible for adoption, notwithstanding the applicant's legitimate aspirations and without calling his personal choices into question. But in E. B. v. France
(2008), the court found a violation of Articles 14 (discrimination) and 8 (privacy) in the refusal to approve for adoption on the ground of the applicant’s lifestyle as a lesbian living with another woman. The court observed that the applicant's homosexuality had been a determining factor in refusing her request, whereas French law allowed single persons to adopt a child, thereby opening up the possibility of adoption by a single homosexual.

In Gas and Dubois v. France (2012) the applicants were two cohabiting women. The court found no violations of Articles 14 (discrimination) or 8 (privacy) in the refusal of the first applicant’s application for a simple adoption order with respect to the second applicant’s child. It saw no evidence of a difference in treatment based on the applicants’ sexual orientation, as different-sex couples who had entered into a civil partnership were likewise prohibited from obtaining a simple adoption order. In reply to the argument that different-sex couples in a civil partnership could circumvent the prohibition by marrying, the court reiterated its ruling in Schalk and Kopf v. Austria (2010) that there is no right to marriage for same-sex couples.

But in X v. Austria (2013), the court held that there had been a violation of Articles 14 (discrimination) and 8 (privacy) when the Austrian courts refused to grant one of the partners (two women in a stable homosexual relationship) the right to adopt the son of the other partner without severing the mother’s legal ties with the child (second-parent adoption). The case was distinguished from Gas and Dubois v. France, in which the court had found that there was no difference in treatment based on sexual orientation between an unmarried different-sex couple and a same-sex couple, because, under French law, second-parent adoption was not open to any unmarried couple, be they homosexual or heterosexual.

In J. M. v. United Kingdom (2010), the court found a violation of Article 14 (discrimination) and Article 1 (protection of property) of Protocol No. 1 in the rules on child maintenance including in the UK Civil Partnership Act, which discriminated against those in same-sex relationships. The applicant was a divorced mother who lived with another woman in a long-term relationship. Because her two children lived mainly with their father, the mother was required to pay 47 pounds per week, whereas if she had formed a new relationship with a man the amount would have been 14 pounds.

**Cases Involving Military Service and Free Speech Rights** The European Court of Human Rights' case law is clear that sexual orientation cannot be a bar to military service, as decided in Lustig-Prean and Beckett v. United Kingdom (1999), Smith and Grady v. United Kingdom (1999), Perkins and R. v. United Kingdom (2003), and Beck, Copp and Bazeley v. United Kingdom (2003). The applicants were all British armed forces personnel, discharged from the forces on the basis of their homosexuality. In all these cases, the court held that there had been a violation of Article 8 (privacy). It found that the measures taken against the applicants had constituted especially grave interferences with their private lives and
had not been justified by “convincing and weighty reasons” (Smith and Grady 1999).

In Kaos GL v. Turkey (2016), the court found a breach of Article 10 (speech) in the seizure of all copies of a magazine published by an LGBTQ association, and in Bayev v. Russia (2017) that Articles 10 (speech) and 14 (discrimination) were violated by legislation banning the promotion of homosexuality. The court, in Bączkowski v. Poland (2007), found violations of Articles 11 (assembly) and 14 (discrimination) in the local refusal of permission to organize a march in Warsaw in 2005 about discrimination against minorities, women, and people with disabilities. In Alekseyev v. Russia (2010), the court found a violation of Articles 11 (assembly) and 14 (discrimination) in the banning of several LGBTQ marches, and in Lashmankin v. Russia (2017) Article 11 (assembly) was violated when authorities placed severe limitations on plans for gay pride public events. In Genderdoc-M v. Moldova (2012), the court held that there had been a violation of Articles 11 (assembly) and 14 (discrimination) in the banning of a planned LGBTQ demonstration in May 2005.

**European Union LGBTQ Law**

Although the institutions of the European Union have often said that the protection of human rights is an important part of EU law, before 2009 the main aspect of human rights that was the subject of enforcement was equality of treatment of the sexes in employment. Only when the Charter of Fundamental Rights went into effect in 2009 through Treaty of Lisbon were many other rights made enforceable. These rights included socioeconomic rights and the right not to be discriminated against on the grounds of sexual orientation. But the rights were directly binding only on the institutions of the EU. They were to be binding on national governments only when they were acting to implement EU law. The United Kingdom and Poland required a protocol to the EU Charter of Fundamental Rights that attempted to limit the application of those rights. This was inspired partly by fears that the ratification of the Charter could force Poland to allow civil marriage to same-sex couples. The two countries refused to accept the Charter as part of the Treaty of Lisbon without the protocol.

The earlier Treaty of Amsterdam, which came into effect in 1999 after being signed in 1997, required the EU to respect fundamental rights, and for the first time there was an explicit reference to sexual orientation. According to that treaty, action could be taken to “combat discrimination based on sex, racial or ethnic origin, religion or belief, disability, age or sexual orientation” (Treaty of Amsterdam 1997, 26). This was done through the Employment Equality Directive (2000), which requires member states to combat direct and indirect discrimination in employment on all the prohibited grounds. A Directive requires EU member states to adopt implementing legislation, unlike an EU Regulation, which has direct effect in national laws.

**European Court of Justice Transgender Cases**
Despite the absence of any reference to transgender rights in EU treaties and legislation, in three cases decided by the European Court of Justice (ECJ) the court enhanced the rights of transsexual citizens. In the 1996 case of *P. v. S. and Cornwall County Council*, a transsexual had been dismissed. The ECJ ruled that discriminatory treatment of a person who has undergone a sex-change operation was discrimination on the ground of belonging to a particular sex under the Directive on equal treatment for men and women.

In the 2004 case of *K. B. v. National Health Service Pensions Agency*, K. B. claimed that her transsexual female-to-male partner would not be entitled to a survivor’s payment because they were not married. They could not marry because her husband was registered as a woman, and it was not then possible to change a person’s sex in the British registry of birth after a person had undergone gender reassignment surgery. The ECJ ruled that EU law on equal pay for women and men also covered discrimination against transsexuals.

In the *Richards v. Secretary of State for Work and Pensions* case (2006), a British pension fund had refused to grant a male-to-female transsexual an old-age pension before her sixty-fifth birthday because she was legally still a man. The ECJ ruled that it was impermissible discrimination against a male-to-female transsexual who would have been entitled to a pension if she could have registered as a woman in the national civil registry. All three of these landmark rulings concerned the United Kingdom, but they applied to all EU member states.

**ECJ Cases Involving Lesbian and Gay Rights**

Curiously, the ECJ has been less assertive in protecting lesbian and gay rights than the rights of transsexuals. In the 1998 case of *Grant v. South-West Trains Ltd.*, Lisa Grant argued that her male predecessor had received a yearly travel allowance for his female partner (an unmarried cohabitee), whereas her female partner had been refused a travel allowance. She argued that if her partner had been a man, she would have received the allowance. The ECJ refused to interpret sex discrimination to include discrimination based on sexual orientation. Instead of comparing the unmarried cohabiting Grant with her unmarried cohabiting predecessor, the ECJ compared her situation to that of a male-male couple and applied an “equal misery argument”: both couples would have been treated equally badly.

One explanation for this ruling was its potential financial repercussions. Transsexuals are a small minority compared to the EU gay and lesbian population of some 35 million that could have benefited from a favorable ruling in *Grant*. The ECJ said that there was no consensus among member states as to whether same-sex relationships were equivalent to relationships between persons of different sexes. It also observed that the European Convention on Human Rights did not then protect same-sex relationships. There was speculation that *Grant* might have been decided differently under the Treaty of Amsterdam, which came into effect in 1999 with a specific reference to sexual orientation. But in the
2001 case of *D. and Kingdom of Sweden v. Council*, the ECJ confirmed its ruling in *Grant* and refused to treat the registered partnership of a Swedish EU official with his male partner as equivalent to a marriage.

The status of same-sex relationships was finally recognized by the ECJ in 2008, in the case of *Maruko v. Versorgungsanstalt der deutschen Bühnen*. Tadao Maruko’s claim to a widower’s pension was refused by the pension fund of German theaters because he and his partner had not been married. German law did not allow gay and lesbian couples to marry, but Maruko and his partner had entered into a registered partnership in 2000, as soon as German law made it possible. The question was whether it would be unlawful discrimination for same-sex couples to be denied rights reserved for married couples when the law did not allow them to marry, and the ECJ ruled that it was for the national court to decide whether a surviving partner was truly comparable to a surviving spouse. The Munich court that had referred Maruko to the ECJ ruled in favor of Maruko, saying that under evolving German legislation surviving spouses and registered partners were comparable with regard to survivors’ pensions.

**Comparison and Prospects**

Paradoxically, the European Court of Justice, which is primarily concerned with economic law, recognized transsexual rights in the UK *Cornwall* case in 1996, whereas the European Court of Human Rights, the premier European human rights court, refused to recognize transsexual rights in the United Kingdom until the 2002 case of *Christine Goodwin*. The specific inclusion of sexual orientation as a prohibited ground of discrimination along with many other rights in the EU Charter of Fundamental Rights means that the ECJ may become even more important for LGBTQ rights in Europe in the future.

The future is likely to bring increasing recognition of LGBTQ rights in both the Council of Europe and the European Union. Although the European Court of Human Rights may recognize a right to same-sex marriage, other cases may be affected by the relatively recent membership in the Council of Europe of eastern European countries with less tolerance of LGBTQ rights, combined with the tendency of the European Court of Human Rights to rely on a consensus of member states. In the European Union the “statutory” recognition of LGBTQ rights in the EU Charter of Fundamental Rights, combined with the smaller membership of largely western European states that recognize LGBTQ rights in national law, may influence rulings by the Court of Justice of the European Union and lead to increased recognition of LGBTQ rights.

The fifteen-year-long Lebanese Civil War (1975–1990) displaced an estimated 900,000 people (Murphy 2006). Today, it is estimated that 6 million Lebanese people live in diaspora, most of whom maintain an active relationship with their native country (Labaki 2006). The filmmaker Fadia Abboud shows the strong ties between diasporic communities and their Lebanese identities, as the dialogue in her web series *I Luv U But* (2012–2014) alternates between English and the Lebanese dialect. The series focuses on the experiences of Lebanese Australian LGBT individuals as they attempt to meet the demands and expectations of both their families and their proud, liberal community.

Abboud is one of the founders of Club Arak, a queer Arab dance party featured in episode 9 of season 1, and also the codirector of the Arab Film Festival Australia. She has written and directed a number of films, including *I Remember 1948*, a documentary screened on SBS (a public TV network in Australia) in 2008, and two short dramas: *In the Ladies Lounge* (2007), which won awards at the Queer Screen film festival, and *Big Trouble, Little Fish* (2010), screened at Flickerfest. *I Luv U But* provides a comic portrayal of the many gay and lesbian Arabs living in the closet in both the West and the Middle East, as proof that the Western pride discourse is not applicable to everyone, even those living in the West. Whereas other writers and directors, such as Abboud’s counterpart Alissar Gazal, who produced and directed the documentary *Lesbanese* (2008), focus on the Western “coming-out” narrative as adopted and altered in Lebanese and Arab LGBT communities, Abboud relocates the discussion within the failures of the pride narrative in Western countries to incorporate Arab culture in its discourse and ideology. Through her web series on Lebanese Australian gay and lesbian lifestyles, she challenges the notion of coming out as a necessary and desirable rite of passage for gay men and lesbians, arguing that not all people would choose to “just give up family for the individual pursuit of happiness” (Abboud, quoted in Taylor 2014).

Set in the heart of the vibrant and multicultural community of Sydney, Australia, *I Luv U But* depicts the lives of queer Lebanese Australian husband and wife Mouna and Sam, who married for convenience. The series consists of two seasons and a total of nineteen short
episodes that average about ten minutes each. Both characters are gay and not “out” to their parents and extended conservative families. The series aims to expose this lifestyle in a nonjudgmental way—to say that it is okay and that there is no right or wrong choice of LGBT lifestyle. Abboud was successful in casting a friendly and likable cast, with Alissar Gazal as Mouna’s mother, who is unaware of her daughter’s secret; Abbey Aziz as the lesbian wife, Mouna; George El Hindi as the gay husband, Sam; and Rose Souaid as Sam’s mother. The first episode begins with Mouna in a wedding dress and Sam in a tuxedo, addressing the viewer in an effort to explain their having to resort to deceiving their families. The series progresses and unfolds, as Sam is seen in episode 3 scrambling to get his date out of his house when his mother-in-law pays him an unexpected visit. The series does a great job portraying the old conservative and patriarchal traditions these Lebanese Australian families uphold when, for instance, in that same episode, Mouna’s mother tells her to “give [her] husband a taste [of the food] before [she] take[s] a bite of it,” or when, in episode 6 of season 1, Sam’s mother asks him: “Why did you marry such an old wife? She’s 35!”

I Lui U But Director Fadia Abboud. Abboud, shown here at the Sydney Film Festival in 2007, used her miniseries to challenge the Western notion that “coming out” is a necessary rite of passage for gay men and lesbians in her portrayal of Arab characters who stay in the closet to avoid alienating their conservative families.

For the Arab communities residing in the West, preserving traditional cultural values is
crucial because they form a minority within a dominant culture with differing values that are constantly changing and influencing their Eastern culture, which seems on the verge of submersion within its dominant host culture. The children of Arab parents feel the pressure to assimilate and find it easier to set aside their Arabic language and Middle Eastern traditions. It becomes more crucial for Arab parents to minimize the Western influence on their families, and they therefore ultimately grow more conservative and religious as a result. Immigrant parents will uphold a romanticized version of traditional values and customs, despite these values and traditions having gone through substantial change since they left their home country (Foner and Dreby 2011). They expect a level of obedience and respect from their children that second-generation immigrants would naturally consider authoritarian and domineering. Parents’ concerns about the corrupting influence of their mainstream Western culture are also related to sexual relations as a second source of conflict. Parents worry about their children’s sexuality and dating choices, but that concern is particularly more acute with daughters than with sons (Foner and Dreby 2011). This leads minority Middle Eastern communities, such as the Lebanese community in Australia, to isolation, which can be devastating for queer Lebanese Australians. In the series, we experience how the couple handles these challenges in their daily lives while being married yet maintaining separate personal lives—Mouna with her partner, Sash, and Sam with his many sexual exploits.

**Portrayal of Marriage**

In *I Luv U But*, queer identity is transformed within the terms of Arab, religious, social, and cultural contexts. The couple finds themselves forced to reconcile many aspects of their identities: the cultural, the religious, and the sexual. For them, as it is for many Arab queer individuals in Western countries, the loss of group belonging is not a sacrifice they want to make for the right to be “out.” This is articulated in episode 4 of season 1, when Mouna tells her partner, who pressures her to come out, “There’s no way I can do what you did to your parents.” Arab families in diaspora, especially mothers, create strong emotional ties that bond members together. Children in immigrant families therefore have a sense of pride in their country of origin and appreciate their parents’ sacrifices and struggles to make a better life for themselves and their children (D’Alisera 2009). And despite the young members of the community resenting their parents’ constraints and obligations, they also feel a strong sense of loyalty, affection, and duty to their parents (Suárez-Orozco, Suárez-Orozco, and Todorova 2008). They recognize the importance of family and the need to provide, financially or otherwise, for their family members (D’Alisera 2009). Gay marriages of convenience have, thus, become the reality for many in the LGBT community as they hail from traditional ethnic and religious environments.

Capitulating to the expectations of their Lebanese heritage, children of immigrant Arab parents enter a heterosexual marriage, at least as far as their families are concerned. It is
not that same-sex acts cannot occur, it is that everyone must keep up appearances that conform to the important principles and values of Arab society: “So long as everyone can pretend that [homosexuality] doesn’t happen, there is no need to do anything [to] stop it” (Whitaker 2006, 10). This manner of keeping up appearances increasingly leads to a widening gap between the demands of society and the daily life the individual leads, as well as between upholding tradition and appearances for the sake of culture and history and the things individuals do in private away from the scrutiny of society (Whitaker 2006). This “double life” almost always involves marriage, because, as already noted, family and progeny are of the utmost importance in Arab society.

Mouna's Lebanese Australian partner goes on to talk about how coming out was not an easy experience for her, how it led to her parents ostracizing her, but how she continues to believe that that was a price she had to pay to be free. To which Mouna then responds, “You’re out but you’re not free.” I Luv U But evinces a pronounced hope for a future in which the price of gay rights and social freedom is not family ties or religion.

Performing Sexual Identity

This web series also serves as a commentary on the intersection of patriarchy, traditional conservative gender dynamics, and homosexuality, as well as on gendered behavior commonly associated with femininity and masculinity. An important factor in the definition of masculinity is the question of activity and passivity, as it has been established by many scholars of literature and cinema (al-Samman 2008; Dialmy 2009a, 2009b; Georgis 2013).

The Lebanese French author Amin Maalouf argues in his 2001 book In the Name of Identity that people identify with certain aspects of their identity when they are under threat of erasure. For many in Middle Eastern communities, homosexuality is a Western threat to their traditional values and national and religious identities. Children in the Arab world do not generally leave their parents’ home until marriage; and once married, they are expected to care for their elderly parents, who eventually reside with one of their children. In order to maintain this structure, familial bonds that rely on heteronormativity must remain intact. Any violation of conventional values, such as divorce, sex scandals, bearing a child out of wedlock, or any violations that are public in nature, are considered threats to the social fabric of these communities. And these threats are articulated in terms of the once-colonizer (current colonizer?) Western Other.

The topic of homosexuality in modern literature and cinema seems to be dominantly framed within the context of the colonial Other, which in turn re-creates the traditional power dichotomy of the active colonizer and the passive Arab partner (al-Samman 2008). The male, by default, is assigned the active role in Arab society in contrast to the female, who is reduced to passivity. Male activity is often accompanied by the insatiable desire to dominate, which carries a patriarchal operation that emphasizes the male as active (Ncube
And to be an active agent in a postmodern Arab society, or in keeping with the patriarchal Arab mentality, is to simply mechanically reproduce heteropatriarchal norms that define masculinity as domination. In *I Luv U But*, Sam inadvertently reproduces these norms, as he differentiates between passive and active masculinities in his personal relationship, shown in this exchange with his lover: “Are you a bottom?” / “Yeah” / “Good, because I’m a top” (season 1, episode 5). His behavior changes, however, when addressing the female characters in the miniseries, as the women take on more dominant roles.

As homosexuality in the Middle East is viewed as the failure of the Arab man to resist colonial influences, gay Arabs in the West seem to compensate for that view by attempting to show that indeed it is possible to be a homosexual and a real Arab man. *I Luv U But* questions the dominant belief that hindered behaviors are innate, depicting the ways in which an individual’s performance of an acquired gendered and sexualized behavior is imposed on them by normative heterosexuality. Judith Butler (1993) questions this distinction by establishing that “gender acts” influence individuals in physical and corporeal ways and that their recognition of corporeal sexual difference is affected and altered by social conventions. Sex, then, stops being “a bodily given on which the construct of gender is artificially imposed” and is instead “a cultural norm which governs the materialization of bodies” (Butler 1993, 2–3). Butler adopts the postmodern technique of viewing reality as determined by language, which ultimately renders it impossible to envision or articulate sex without imposing linguistic norms: “there is no reference to a pure body which is not at the same time a further formation of that body” (10). Thus, many Arabs who engage in same-sex practices do not identify as “lesbian,” or “bisexual”; they have formulated their “gay, sense of self through various culturally specific encounters and remain unconnected to the word *gay*. Even among those who may feel at home in their gay identity, the notion of publicly coming out rings hollow in a culture where who you share your bed with is a private matter.

**The Lebanese Mother**

In most works of literature written by Arab women that tackle the period of postcolonial wars, mothers and motherhoods have acquired centrality (Cooke 1994–1995). The nurturing persona, who in the literature of the colonial period seems bent on molding her daughter into her own resistant shape, has multiplied so as to be able to play numerous roles. These mothers are both aggressive and pacific, patriotic and nationalist, desiring and destructive, martyr and prisoner. They may be all of these at once or at different times. Motherhood, or the act of mothering, becomes a multifaceted tactic of resistance, and the literature to which it belongs becomes an act of resistance in and of itself (Cooke 1994–1995). As such, Arab motherhood is constantly reconstructed to suit its challenges. In *I Luv U But*, mothers embody the motherland. Sam’s mother represents a more modern Lebanon with her talk of seeking independence and living life to the fullest (season 2, episode 3) and...
of reconnecting to her womanhood and embracing her sexuality (season 1, episode 6). Mouna’s mother is constantly cooking Lebanese dishes for her daughter and son-in-law, as if to preserve her and her homeland’s memory in an inward culinary landscape, providing the framework of reference needed by her daughter. The maternal culinary heritage represents “the cultural agency of resistance and endurance ... [as] the mother teaches her daughter the importance of certain ‘memory foods’ that inscribe an entire ethos of harmonious living as her best defence against cultural erasure” (Mehta 2009, 213).

Immigrant families, therefore, are crucial to the development of children’s personal identities and ideologies, as they provide them with ideas of nation—making father and mother figures central in most Arab immigrant works of literature (Mehta 2009). The absence of fathers from I Luv UBut, however, is an indicator not of the lack of importance of fathers in the Lebanese familial structures but of the more masculine roles Lebanese mothers took on in the family following the Lebanese Civil War, when mothers had to replace the physical and emotional absence of the fathers and sons who left to fight or died in the war (Cooke 1994–1995). Mouna’s mother represents that Lebanese mother who had to raise her child alone. Middle Eastern and Arab queer cinema is growing in relevance and importance under current economic and political conditions, such as those that followed the Lebanese Civil War, as it redefines the link between the public field of radical politics and the private realm of sexuality and desire. These works demonstrate how both female and queer sexualities often serve as figures of sacrifice and marginalization and repression within the nationalist struggle and the subsequent formation of national states (Aaron 2004). The place of queer sexuality, in light of the predicament of postcolonial nationalism, is thus a social and political position.

**International Gay Arab Representations**

The first season of I Luv U But found a following not just in Australia but in Arab countries such as Saudi Arabia and Lebanon; it was nominated for Most Engaging YouTube Channel in Lebanon's Social Media Awards in 2013. “There hasn’t been a queer Arab story that isn’t about poor us,” Abboud says. “This is almost a celebration and a comedy that says it’s OK not to come out. And it was really well-received for that reason” (quoted in Taylor 2014). I Luv U But filled an important gap in gay Arab representation. It was a breakthrough in terms of positioning racial minorities within the global/Western queer life and discourse. It also touched on the difficulties queer Arabs face integrating into mainstream Western society. It made these insinuations frequently, but in passing, just as these incidents take place in real life; examples include when Sam tells his cousin to shave because Western men do not find body hair attractive (season 1, episode 7), or when Sam employs the Orientalist image of Arabs as terrorists to scare his bedmates into leaving: “My mother just got back from a military camp with Hezbollah and she’s outside right now. Get out!” (season 2, episode 1). Such topics are essential to address considering not only how
undeniably close the mainstream LGBTQ movement in the West has aligned itself with capitalism and the military, but also the growing anti-Arab and Islamophobic sentiments of the second decade of the twenty-first century. In today’s dominant global queer ideology, the only acceptable visible queer Arab is the victim who exchanges his Arabness and native culture for the more tolerant Western nation.

*I Luv U But* ended with an episode titled “I Luv U,” in which Mouna and Sam attend a pool party given by Ali Baba, where Mouna reminisces on the good times she had with her ex-girlfriend Sash, who has continuously expressed difficulty in being in a relationship with a closeted lesbian, especially considering that she herself is a Lebanese Australian and has chosen to come out to her family. Ali Baba reconciles Sash with Mouna by enlightening the latter about the complexities of the queer Arab identity. What she says encapsulates the message of the web series: “Being gay is complicated. Being Arab and gay is even worse. Coming out isn’t the be all end all kind of thing. It’s actually OK not to be out. What really matters is what’s here [pointing at her heart]. Everything else is pure decoration.”

**BIBLIOGRAPHY**

Georgis, Dina. “Thinking Past Pride: Queer Arab Shame in *Bareed Mista3jil.*” *International

Alaa al-Aswany's 2002 novel *Imarat Yaʿkubian* (*The Yacoubian Building* [2004]) appeared at a transformative time in Egyptian history. Published just months before the announcement of the American-led invasion of Iraq, the book began circulating as internal pressure began to rise in response to the government's apparent complicity or, at best, silence on the pending war. It was the second time in the then twenty-year tenure of President Hosni Mubarak that Egyptians had been asked to cooperate in a US-led attack on a fellow Arab nation. The first Gulf War (1990–1991) brought scores of protests and a subsequent crackdown that would reignite a fierce opposition campaign led in large part by the country's largest outlawed organization, the Muslim Brotherhood.

At the core of the government's ostensible complicity with the Americans was an overwhelming sense of hypocrisy. As Saad Ibrahim, a well-known academic and former chairman of the Ibn Khaldun Center for Development Studies in Cairo, wrote in a review of al-Aswany's novel:

> Egyptians bemoan their lack of freedom, yearn for an open society, fear Islamic militancy, and resent US hegemony. Yet official Egypt proclaims itself to be the guardian of the true Islam, a strategic ally of the United States, and a beacon of democracy. Few, if any Egyptians, believe these official proclamations, and worse, the hypocrisy is a crushing weight on their hope for progress.

*(COMBAHEE [1977] 2009, 3)*

Ibrahim described reading al-Aswany's novel (along with his prison guards) while incarcerated in Egypt's notorious Tora Farm prison. He wonders how the novelist, who captured so elegantly the same hypocrisies he observed, could remain unprosecuted while he stewed in jail. The situation reflected yet another of the many complex inconsistencies that characterized the regime's brutal, if brittle, grip on power.
Characters, Setting, and Plot

The novel is set around the time of the first Gulf War. Told in the bygone style of mid-twentieth-century realism, the novel depicts the interconnected lives of a dozen characters in a real-life decaying apartment building, called the Ya'kubian, built at the dawn of the twentieth century in Cairo’s historic downtown. The characters include: Zaki Bey el Dessouki, the now elderly Paris-educated son of a pasha (Turkish officer of high rank); Hagg Azzam, a ruthless and corrupt businessman with political ambitions; Busayna el Said, a young woman who must endure her employer’s sexual harassment in order to help provide for her younger siblings; her fiancé, Taha el Shazli, the son of the building’s doorman who hopes to advance in society by becoming a policeman; and Hatim Rasheed, the wealthy half-French, half-Egyptian editor of a French newspaper, who is gay. Al-Aswany’s inclusion of a gay character is notable for breaking the taboo on homosexuality in Egyptian literature.

Al-Aswany’s characters endure a methodical string of coincidences, common enemies, and shared miseries. More importantly still, the characters of *Imarat Ya’kubian* continually trade places. They drift from positions of power to positions of powerlessness, from love to hate, from virtuousness to depravity. They lose and rediscover a sense of autonomy, of citizenship in the face of oppression, and of alienation in the face of fraternity. Each in his or her own way is victimized by the corruption in Egyptian society and government that traps them in their circumstances with no hope for advancement.

The novel opens with Zaki Bey el Dessouki, who owns office space in the Ya'kubian, finally achieving his goal of seducing a local barmaid, only to discover after the encounter that she has drugged and robbed him. Zaki is a former engineer whose life now revolves around doing little besides seducing women; he represents the former ruling class in Egypt, which was cultured, secular, and cosmopolitan. His upper-class counterpart, Azzam, on the other hand, clawed his way from poverty to riches, and now uses his business dealings to hide his hashish empire. He uses the pretense of Islam to cover his immoral behavior. Busayna, who lives in the makeshift apartments on the building’s crowded rooftop, is frustrated with Taha el Shazli’s inability to financially provide for her; this ends up causing her to fall in love with Zaki “Pasha” instead. This turn of events is a blow to Taha, who is both honest and intelligent but is unable to advance in society because of his poverty and lack of social connections.
When Taha arrives to sit for his entrance exam to the police academy, the presiding officer asks about his father’s profession. Taha explains that his father is a “civil servant.” The officer corrects him, saying that his father is really a “property guard.” Both humiliated and outraged by the demand that he pay a bribe to enter the academy, Taha gives up his dream of becoming a police officer and enrolls as a student at Cairo University. There, he is drawn to the comradery of a group of devout Muslim students, and his disillusionment causes him to become radicalized. He then falls in with the clandestine cell of an organization based loosely on the outlawed al-Jama’a al-Islamiyya (the Islamic Group).

The course of Taha’s trajectory is a familiar motif in Egyptian literature. (The Egyptian Nobel laureate Naguib Mahfouz depicts a similar character’s evolution in the third installment of his famous Cairo Trilogy [1956–1957].) It also serves as the novel’s clearest iteration of social critique. Both Busayna and Taha are funneled to their respective paths—Busayna into moral compromise and Taha into increased religiosity—by the economic inequality of Egyptian society.

This economic inequality is also evident in the relationship between the gay character, Hatim Rasheed, and his impoverished, married lover Abduh. As the editor of a newspaper, Hatim is wealthy and cultured. Abduh, on the other hand, is a migrant from the South, a low-level security officer posted to an unfamiliar neighborhood in Cairo, as was
commonplace at the time. Their relationship is asymmetrical, violent, and doomed. Hatim initially seduces Abdulh by getting him drunk on wine and showing him pornographic movies. Over time Abdulh becomes financially dependent on Hatim. He relocates his family from the South but spends his evenings drinking and fornicating with Hatim. Abdulh becomes so impaired by his pseudo-enslavement to Hatim that he is no longer able to have sex with his wife without sodomizing her. The collapse of this holistic peasant marriage is maximized by an episode of unspeakable tragedy. Home alone, Abdulh’s wife is forced to call on Hatim to pay for their infant son’s hospitalization when the baby falls severely ill. Hatim responds, but the effort is too late, and the child dies. Abdulh interprets the event as God’s judgment on him for his relationship with Hatim and breaks off his affair with him.

**An Allegory of Social and Spiritual Decay**

To frame the parameters of this demonization narrative, al-Aswany situates the gay affair within a neatly coded allegory of social and spiritual decay. In textual terms, the most blatant technique for doing this is the author’s calibrated use of narrative sequencing. A lengthy passage detailing Abdulh’s full transformation from national serviceman to gay lover is preceded by the graphic climax of Taha’s interrogation and torture by secret state-security officers that includes his rape: “two thick hands reached down, grabbed his buttocks, and pulled them apart. He felt a solid object being stuck into his rear…. He screamed at the top of his voice” (al-Aswany 2004, 153).

Al-Aswany’s fame has derived in large part from his willingness to depict taboo subjects; his genius, however, can be found in the easy symmetry of his prose and his fluid capacity for defusing controversy through the rhetorical reinforcement of the status quo. The gay couple in *Imarat Ya’kubian* accomplishes this masterfully. Cast against the frieze of the novel’s aesthetic infrastructure— the fin de siècle settings, the glasses of whisky, and the music of Edith Piaf—Hatim is at once a creature and a by-product of Cairo’s bygone elegance. The editor of a French newspaper, he is a renowned public intellectual by day and a closeted homosexual “hobbyist” by night. This arrangement is less a matter of pragmatism, as one might intuit (everyone “knows” that he is a homosexual because “homosexuality is impossible to hide” [al-Aswany 2004, 177]), and more an expression of his psychology.

Al-Aswany psychologizes Hatim more than any of his other characters. The diagnosis—crass, racist, and uncreative—is that Hatim is gay because he was abused by his Nubian doorman as a child. His father, Francophile and worldly, never loved him but rather, he thinks, “treated me as though I were a rare art object or painting” (al-Aswany 2004, 181). His mother (whom he despises) was equally neglectful. Notably, however, she was French: “a barmaid at a small bar in the Latin Quarter” who, after moving to Egypt with her husband (“a bigger social leap than [she’d] ever dreamed of”), adopted the airs of indignant superiority over her Egyptian peers (181). So while Hatim, like Zaki, speaks French, he is
not a Francophile. He did not acquire his Mediterranean sophistication like Zaki. Rather, Hatim, a creature of miscegenation, is a sort of traitorous impostor, a poisoned pill who poisons all those whom he touches. His violent murder at the hands of Abdugh logically elicits little empathy from the narrator. Indeed, his penultimate words, “you’d strike your master you dog of a servant” (235), welcome the opposite interpretation. We are to cheer the gay man’s murder.

The Cultural and Political Context

Al-Aswany’s depiction of a gay love affair in Imarat Ya’kubian was not without context. As Samia Mehrez (2008) observed in her iconic study on Egypt’s culture wars from the 1990s and early in the next decade, sexuality and homosexuality, in particular, had become a firebrand point of contention in the simmering political warfare between Egypt’s oppressive secular regime and an insurgent wave of religious conservativism. Mutually reinforcing and vying for influence amid a deeply religious civil society, the regime empowered yet more radical calls for shari’aa just as the influence of the Muslim Brotherhood obligated the regime to harden its own posture of religious identity.

Mehrez, who had come under fire for teaching Mohammed Choukri’s 1973 masterpiece For Bread Alone (finally published in Arabic in 1982 as al-Khubz al-Hafi), begins her study with 2005, when the Muslim Brotherhood gained a shockingly high number of seats in Parliament for the first time and liberal groups across the nation were beginning to organize for greater protections. Al-Aswany’s novel capped a period of tumultuous jockeying for attention among the country’s literati. Since al-Aswany was a veritable “novice,” as Mehrez (2008) points out, there was little by way of intrinsic value in his novel and certainly nothing in the way of the kind of experimentalism one finds in a work like For Bread Alone. However, what Imarat Ya’kubian did share in common with Choukri’s novel was its depiction of sex, and homosexual sex in particular. It was this critical aspect, arguably, that elevated the attention behind the novel and that helped catapult al-Aswany into global stardom. Imarat Ya’kubian was made into a film in 2006 and became one of Egypt’s highest grossing films of all time, as well as an immensely popular television series a year after that.

Among the sensitive issues at the center of the cultural wars from which Imarat Ya’kubian emerged was Cairo’s booming and infamous gay night scene. As Sarah Kershaw wrote for the New York Times in 2003, “this hectic and vibrant city on the Nile was the place to be…. There were bars and discos and plenty of public meeting places in the city center where it was relatively easy to socialize, exchange cellphone numbers, hold hands and perhaps—for the more daring—sneak a kiss.” The infamous Queen Boat police raid of May 2001, when authorities stormed a casino houseboat on the Nile and arrested fifty-two men on charges of “debauchery,” signaled an end to the underground scene, as well as a new direction in the culture wars. The crackdown on “debauchery” was not merely a socially conservative
response to an ostensible “rise” in gay activity but a pretext for broader surveillance, particularly online, where much of the gay social scene was thought to be occurring (Kershaw 2003). Al-Aswany engages this topic directly in one of the novel’s many anecdotal scenes, when a disgruntled journalist for Hatim’s French newspaper *Le Caire* proposes to do a piece on the “phenomenon of homosexuality in Egypt.” Intended as a passive insult to his boss (“there’s been a major increase in the number of homosexuals and some of them now occupy leadership positions in the country” [al-Aswany 2004, 178]), the journalist’s commentary serves to reinforce the unsaid fact that “everyone knows he’s gay” and that Hatim has learned how to endure and vanquish his detractors.

As an antagonist, Hatim’s character crystalizes the novel’s underlying ideological bent: the country is swerving toward ruin, not simply the result of a corrupt and despotic political system (which is neatly captured by the subnarrative of Hagg Azzam, who attempts to purchase a parliamentary seat just as he does his second wife), but of an underlying social rot of which homosexuality is a central if clandestine piece. In dialectical fashion, al-Aswany’s figurative symptoms—extremism and homosexuality being the most outstanding, as both conditions lead to death—help bring into focus predominant tenets of Egyptian nationalism: namely, security and Islam. *Imarat Yaʿkubian* offers a nuanced critique of those elements that fall outside this nationalist paradigm, including false positives like Hagg Azzam who, despite a drug habit, zealously upholds his religious identity for the purpose of material gain, or Hatim, who champions nationalist causes (including creating an Arabic version of his newspaper) despite being gay. The danger of such impostures is made even more explicit by the inherent goodness of the earnest if flawed protagonists of the novel—Zaki, Busayna, and Taha.

Beyond this novel, al-Aswany has been an outspoken proponent of the pro-democracy movement in Egypt, including, notably, the 25 January uprising (part of the greater Arab Spring movement of 2011), where he rose to prominence as a kind of informal spokesman for the protesters of Tahrir Square in Cairo. But his political advocacy has seldom strayed beyond the parameters of the country’s official narrative, which upholds the military as protectors of liberty and the Egyptian people as custom bound by the mores of Islam. This became evident in his early support for the military coup of 2013 that led to the ouster of Mohamed Morsi, Egypt’s first democratically elected leader. “Morsi became president through the votes of 13 million Egyptians,” he wrote, “while the Tamarod campaign was able to collect 22 million signatures to withdraw confidence from him. Then, more than 30 million Egyptians took to the streets to demand he step down…. Thus, the ouster of Morsi in this manner was a completely democratic procedure” (al-Aswany 2013). Al-Aswany’s primary defense of the Tamarod campaign, however, was based on cultural grounds. “In just one year, Egyptians were able to realize the difference between Islam and political Islam,” he wrote. “The people discovered that the Brotherhood were using religion for political goals, and not abiding by its principles” (al-Aswany 2013). Much like the antagonists of his novel, the Brotherhood, for al-Aswany, were impostors. And, as such, the
military was right to evict them from power.

The Wholesome Relationship between Zaki and Busayna

In contrast to the double lives of Hatim or Hagg Azzam (who never tells his first wife about his second wife), the heroes of *Imarat Ya’kubian*, Zaki and Busayna, are wholesome in the sense that they are exactly who they say they are. Busayna is amazed to meet a “true Pasha” (the title now a commonplace term of endearment), and Zaki is delighted to discover a woman of pure innocence. That he is three times her age, that she works for him, and that they have sex out of wedlock are all details extraneous to the otherwise impervious value of their respective characters. Their marriage offers something of a happy ending in al-Aswany’s ethical universe. Unlike the relationship between Hatim and Abduh that ends in a pool of blood, or between Hagg Azzam and his second wife, which ends with her being abducted and forced to abort a pregnancy, the relationship between Zaki and Busayna is successful in part because neither has anything to hide. This is a somewhat cruel criterion, of course, particularly for Hatim, who has little choice but to separate his public and private lives.

The 2006 Film Adaptation of *Imarat Ya’kubian*

Marwan Hamed’s 2006 film adaptation, *The Yacoubian Building*, of al-Aswany’s novel drives home the precariousness of Hatim’s dual existence. His murder in the cinematic version comes at the hands of an anonymous young man, presumably a male prostitute he has solicited after his breakup with Abduh. Such dramatic licensure on the part of the director appeared calibrated to preserve the innocence of the rural police officer, while driving home the criminal dimensions of Hatim’s enterprise. His assassin strips him of his watch and snatches his wallet before fleeing the scene of the crime. But just as the adaptation effaces Abduh’s crime of passion, it denies Hatim the privilege of tragedy. His death as portrayed in the film is arbitrary, meaningless, and yet, in this way, inevitable. Designed for a broad and conservative audience in the Egyptian public, the filmic interlocutor of this important modern narrative chose the path of complacency, which, in the end—and in light of the movie’s massive success—may be the greater tragedy.

BIBLIOGRAPHY

**FILMOGRAPHY**

Starting around 1500, as new maritime knowledge enabled the expansion of global trade and the establishment of overseas empires by the Spanish, Portuguese, Dutch, British, and French states and their subjects, European contacts with other cultures multiplied. This had important consequences for the global history of sexuality, especially after 1700 when a binary sexual system in which desire was organized around a sharp sense of male-female difference emerged in northwestern Europe, arguably displacing a more fluid traditional system in which differences in age might in some cases be as important as biological sex (Trumbach 2013). Explorers and other travelers encountered various kinds of same-sex erotic behavior, including roles that blurred gender boundaries, such as the people Europeans called “berdache” in North America (a term borrowed from the Middle East). These were biological males who assumed a female gender role and who had sexual relationships with men. Writing about these observations and stories contributed integrally to the processes that shaped the formation of modern sexual identities in the West and beyond from the eighteenth to the twentieth centuries, including male and female homosexual identities and their stigmatization (J. Burton 2013). While reported homo-erotic acts in places as diverse as Brazil, China, and North Africa were widely condemned as signs of moral degeneracy among the uncivilized “other,” in the late nineteenth century, ethnographic data suggested to some progressive thinkers that sexual attraction between members of the same sex was universal and therefore natural. In particular, this paradigm was invoked by the English social thinker Edward Carpenter (1844–1929), who promulgated a notion of “intermediate types” at the start of the twentieth century, and by leading European sexologist Magnus Hirschfeld (1868–1935) to support his influential argument that these people constituted a “third,” intermediate sex (Bleys 1995).

The observations and generalizations of European travelers and theorists were shaped by their own cultural and political assumptions and interests and should not be read as adequate representations of the beliefs and practices of the societies they purported to describe. This may be glossed by considering briefly the common claim that “pederasty” was both ubiquitous and generally acceptable in Arab societies. One well-known source of this belief was the British imperial adventurer Richard Francis Burton (1821–1890), who
published an unexpurgated English version of *One Thousand and One Nights* in 1885–1886. Burton attached an essay arguing in part that same-sex behaviors (which he called the "Vice") were to be found in a geographic and climatic belt that he dubbed the Sotadic Zone, a broad swathe of territory that included much of southern Europe, the Middle East, Asia, the Pacific Islands, and the Americas. The sweeping essentialist claims of Burton, exemplified by the somewhat incongruous assertion that the Turks were "a race of born pederasts," have been repeated by many commentators, including historians, who failed to appreciate the variety and subtlety of sexuality across North Africa, the Middle East, and Central Asia (Bleys 1995; El-Rouayheb 2005). Historians have analyzed several strands of male same-sex eroticism in urban Islamic culture in the premodern Arab Ottoman Empire, including the cultural meanings attached to the insertive and receptive roles in age-structured acts of anal intercourse, which were closely aligned with normative gender roles. An adult man who acted as the receptive partner often attracted scathing criticism for performing the "female" role, but this was muted or absent in the case of a man performing the insertive role with an adolescent male (El-Rouayheb 2005).

A key point to emerge in this entry is that European imperialism and colonialism brought political and ideological forces of change to bear on the cultural meanings of same-sex acts and relationships among peoples around the globe. These were often exerted through systematic acts of legal and cultural suppression, the resonances of which are still present in the twenty-first century. Some contemporary historical scholarship is focused on attempting to recover these precolonial understandings and tracking the processes of change, an endeavor often directed toward the political purpose of emancipating LGBTQ+ people in postcolonial societies around the world.

**Regulating Male Homosexuality**

In his account of the demolition of the Portuguese-built fort in the Southeast Asian entrepôt of Malacca (Melaka) by the British in 1806–1807, the Malay writer Abdullah bin Abdul Kadir (1796–1854) referred to torture instruments once used by the Dutch, who had captured the city from the Portuguese in 1641. These included a barrel with nails protruding into it. The unfortunate victims “were rolled about inside it until their bodies were torn to shreds” (1955, 61). This was the terrible punishment inflicted on people convicted of “unnatural offences.”

**Criminalization** As European states extended their political reach and established colonial governments, their remit included the regulation of sexual relationships, a task made more complex and acute as increasing numbers of European men and some women lived in the colonies for long periods or were born and raised there. Christian missionaries, too, were implicated in attempts to eradicate homoerotic practices, an endeavor that was sometimes resisted by indigenous peoples (Mitchell 2007). The attempts of colonial regimes to police sex between men were underpinned by several shifting and overlapping ideologies. The
early Dutch Republic drew on the language of Reformed Protestantism, and Christian traditions were widely influential through to the twentieth century. Although Enlightenment rationalism contributed to the decriminalization of sodomy in France in 1791, and the new legal code was applied both throughout the Napoleonic continental empire and France’s colonial possessions, most European imperial states continued to prohibit and punish sexual acts between males. Indeed, with the growth of the bourgeois state and the development of the secular theories of evolution and degeneration, the range and intensity of these prohibitions increased (while punitive sanctions softened). This process can be observed in the German colonial empire.

Germany became a political entity upon the unification of the disparate German states in 1871, and its nascent overseas empire expanded rapidly under Wilhelm II (1859–1941) during the most intense phase of European colonization, known as the New Imperialism. Paragraph 175 of the German criminal code of 1871, which forbade penetrative sexual acts between men, was predicated on new legal and medical understandings of sexual desire, which were elaborated by the academic discipline of sexology. The homosexual, as he came to be called, was considered by most political leaders to be a threat to the authority of the emergent bourgeois order (Walther 2008). Although sex between white men and native women arguably raised critical issues such as the possibility of miscegenation, which became increasingly proscribed in the nineteenth century, all European colonial regimes tolerated some forms of heterosexual coupling. Any kind of sex between European and indigenous men, however, was deemed to conspicuously transgress the ideological boundary between colonizer and colonized. An allegation of homosexual behavior could be an incendiary weapon in personal and political conflicts, sometimes igniting major scandals, such as the Rechenberg scandal in German East Africa in 1910, named after the colony’s governor, Georg Albrecht Freiherr von Rechenberg (1861–1935). Rechenberg was accused of sodomizing his personal servant and consorting with a prostitute from the male brothel in the colonial capital of Dar es Salaam (Schmidt 2008). In German New Guinea, governors summarily expelled European men deemed guilty of homosexual acts. From the perspective of German nationalists, same-sex activity was inconsistent with being white and German, and it threatened to undermine the claim of racial superiority that buttressed the assumed right to rule colored and black people (Walther 2008).
The criminalization of male homosexuality had significant consequences not only for European men but also for indigenous peoples, especially throughout the British Empire. From the 1860s on, a common set of legal codes, based on the provisions enacted in India and the Australian colony of Queensland, were applied across the territories under British jurisdiction. Enacted a few years after the Revolt of 1857, Section 377 of the Indian Penal Code may be viewed as part of the transition from East India Company rule to a British Crown-controlled, fully bureaucratic imperial state in which the line between colonizers and colonized was drawn more sharply. The statute explicitly prohibited and punished with long prison terms and fines “carnal intercourse against the order of nature with any man, woman or animal,” and was usually applied to acts of anal and oral intercourse between men (Bhaskaran 2002).

During the twentieth century, and particularly after World War II (1939–1945), when the process of decolonization occurred throughout Asia and Africa, more than thirty independent countries inherited this punitive model from British colonial regimes. A careful statistical analysis shows that former British colonies were twenty-two times more
likely than a very large sample of 155 former French, Spanish, Portuguese, and Dutch colonies to enact statutes prohibiting sexual relations between men (Han and O’Mahoney 2014). Section 377 was repealed as recently as 2009 by the Delhi High Court, only to be reinstated in 2013. In 2017 the Supreme Court of India argued that discrimination on the grounds of sexual orientation violated a person’s right to privacy, and ruled that same-sex sexual activity could not be prosecuted under Section 377 in September 2018.

One of the ironic consequences of this history of suppression is the claim made in the present day by some African and Asian community and political leaders that homosexuality itself is an anathematic Western concept. In some African states, “violent public attacks on homosexuality are frequently couched as defenses of what is traditionally African from a contaminating Western influence” (Lewis 2011, 210). It appears that the legal and religious interdiction of same-sex eroticism by colonial rulers and Christian missionaries caused people to forget or deny their own traditional homoerotic practices. In the case of Africa south of the Sahara, denial began with the European imperialists, some of whom originated the stereotype of African male sexuality as exclusively heterosexual. They believed that Africans were “natural” beings who lacked the sophistication to perform sexual acts for any purpose other than biological reproduction, although it is now known that a variety of male and female homoerotic practices existed among Africans prior to European colonization (Lewis 2011).

The denialism of postcolonial political leaders may also be read, as Neville Hoad has proposed, “as displaced resistance to perceived and real encroachments on neocolonial national sovereignty by economic and cultural globalization” (2007, xii–xiii). This interpretation pays attention to the international context of the 1990s, when homophobic sentiments were articulated in several African countries, including Zimbabwe, Kenya, Uganda, and Namibia. To add a further layer of irony, in the case of the South African gold mines in the twentieth century, indigenous homoerotic acts were inflected and perpetuated within a colonial institution. There, black migrant workers, particularly from what is now Mozambique, participated in a social system in which power was structured by a kind of “marriage” relationship between an older and a younger miner. The younger miner assumed the role of a “wife” who was the receptive partner in intercrural (between the thighs) intercourse, a practice characteristic of premarital sexual relationships between men and women in southern Africa. The mine marriage system remained in place through the various stages of colonial rule and continued after independence (Moodie 1988).

**Literary Censorship** In addition to legal repression, the memory of indigenous homoeroticism was erased by removing its representation from literary texts. In post-1857 India, for example, colonial administrators condemned what they considered the homoerotic “vulgarity” of Urdu and Persian poetry, which was sanitized by a new generation of scholars and teachers dependent on stipends paid by the colonial government (Kugle 2002). Something similar occurred in the Ottoman Empire starting in
the mid-nineteenth century. Under the influence of a new, Western-oriented elite, all forms of homoeroticism came under attack. Bowdlerized versions of *One Thousand and One Nights* and other works were published, and by the second half of the twentieth century Ottoman Arab historians routinely denied the existence of “pederastic” themes in the literary tradition. In the 1940s a new Arabic term to express the European concept of “sexual inversion” became common (El-Rouayheb 2005). This points to the emergence of something like a global cultural hegemony of modern Western concepts, which often supplanted, suppressed, or at least supplemented indigenous and earlier paradigms. Therefore, in order to recover and understand indigenous concepts and practices, as well as to challenge continuing homophobic cultural representations and legal oppression, some contemporary scholars of African sexualities question the legitimacy and integrity of binary representations of gender and sexuality (Lewis 2011).

**Flexibility**

As significant as these findings and developments are, they should not be allowed to entirely obscure some variations in the ways in which same-sex desire was inflected in British and non-British colonies across more than four centuries of European rule and influence over a wide range of geographically and culturally diverse societies. It should not be assumed that written statutes and rewritten texts effectively inhibited all same-sex eroticism or necessarily governed behavior. A case in point is that of mid-eighteenth-century Philadelphia, a very important commercial center in British North America, with residents from various British and European backgrounds, as well as from Africa and the Caribbean. It has been found that while the colony of Pennsylvania enacted several statutes criminalizing sodomy, punishments were milder than under comparable British laws, and there is no evidence of active policing of male same-sex relations. As prosecutions at that time depended on private citizens bringing charges against alleged offenders, the dearth of cases appearing before the courts suggests that general tolerance or indifference prevailed. This stands in contrast to several contemporary western European cities where a new male homosexual subculture, typified by the London molly houses, attracted vigilant policing and publicity. Philadelphians were aware of these developments, but they did not identify this new category of sexual deviance among themselves. This probably reflects the Quaker roots of the colony, the social diversity and fluidity of the resident population, and the desideratum, at least among white males, to build a common identity (Lyons 2007).

**Cross-Cultural Homoerotic Relationships**

Many historians of colonialism, following the influential work of Ann Laura Stoler (2002) on Indonesia, analyze the role of sexuality, even in ostensibly private spaces, as an integral component of the exercise of power by imperial regimes. This raises issues concerning homosexuality. In addition to there being risks in expressing same-sex desire in territories
under European rule, it has been argued by some historians, notably Ronald Hyam (1990), that there were also plentiful opportunities, although it is uncertain whether they were everywhere greater than in Europe. Cross-cultural homoerotic relationships were often facilitated and structured by social institutions such as domestic service, and race and class were important elements of desire. These interactions were, therefore, inherently unequal, and some were indisputably exploitative. However, they were not uniformly so across all time and space, as Edward W. Said’s influential “Orientalism” model might imply. Said (1978) held that European intellectuals created a hegemonic discourse that unfavorably stereotyped non-European cultures by comparison with European norms. Instead, as more recent cultural studies of empire insist, historical events and situations were varied and nuanced (Darwin 2012). Many of the Western romantic partners of colonized people known to history showed genuine respect and appreciation for the cultures of their friends and lovers, albeit circumscribed by their own values and interests; and some publicly criticized European imperialism. It should also be acknowledged that the indigenous partners exercised agency in many of these relationships, and so it might be ventured that European imperialism expanded the sexual opportunities available to some colonized peoples.

China and India are especially interesting for examining the ways in which sexual desire was interwoven with cultural appreciation for select groups of elite Western men, some of whom had rejected Christianity and sought alternative sources of intellectual and spiritual inspiration. China was never a colony of any particular European state, but for around a century starting with the first Opium War (1839–1842), all the great powers of Europe, the United States, and Japan won and held significant trade concessions at a large number of locations along China’s eastern seaboard, and autonomous foreign enclaves emerged in these treaty ports. Imperial China had a long male homoerotic tradition that can be tracked in its literature (Hinsch 1990). In the nineteenth and twentieth centuries, Chinese culture made a powerful appeal to the imagination of Western men attracted to the aesthetic qualities of its art, theater, and music, as well as to the bodies of Chinese men. A number of them visited China and some lived there for extended periods, finding abundant sexual opportunities in the relatively tolerant urban milieu of the late Qing and Republican states. A good example is the English writer and aesthete Harold Acton (1904–1994), who lived in Beijing for most of the 1930s. Acton translated Chinese poetry and was passionately interested in classical theater, where homoerotic and aesthetic sensibilities intertwined. He admired the delicate bodies of some young Chinese men and enjoyed many sexual relationships and intellectual friendships during his residence there (Mungello 2012).

Around the same time, Indian culture, philosophy, and religion fascinated some well-known European homosexual men, including the British social radical and pioneering advocate of homosexual rights Edward Carpenter (1844–1929), the English American novelist Christopher Isherwood (1904–1986), the eminent French Indianist Alain Daniélou (1907–1994), and the English novelist E. M. Forster (1879–1970) (Aldrich 2003; Copley
Forster is a particularly good example of the interweaving of romantic and cross-cultural engagement. One of the main purposes of his first trip to India in 1912–1913 was to visit the Oxford University–trained educationist Syed Ross Masood (1889–1937), whom he had met in England in 1906. The two men shared a close and long-lasting friendship that was suffused with erotic feelings on Forster’s side. Forster later claimed, in hyperbolic fashion, that Masood “woke me up out of my suburban and academic life, showed me new horizons and a new civilization and helped me towards the understanding of a continent” (quoted in Moffat 2010, 91). In 1921 Forster visited India a second time, working for several months as the private secretary to the Maharaja of Dewas. Although critical of inefficient administrative practices and much coyer about sexuality than J. R. Ackerley’s travel memoir *Hindoo Holiday* (1932; revised 1952), Forster’s *The Hill of Devi* (1953) attempts a genuine engagement with Indian cultures and people. A more significant literary legacy is his greatest novel, *A Passage to India* (1924), which derides colonial rule and features an interracial friendship between the main characters, Dr. Aziz and Cyril Fielding, that is susceptible to a homoerotic reading. Although Forster’s work is colored to a degree by an Orientalist perspective, it demonstrates how cultural and sexual appreciation of the “other” might be closely related.

During World War I (1914–1918), Forster worked as a Red Cross volunteer in the Egyptian city of Alexandria. Egypt had inherited the Napoleonic penal code, and so homosexual acts were technically legal, but the city came under martial law after Britain imposed a protectorate over the country in 1914, and the authorities sought to curb the sexual license prevalent in some quarters. Early in 1917 Forster met Mohammed el Adl (1900–1922), a tram conductor, and the two soon became lovers. Forster kept a notebook on el Adl, which included transcripts of some of their correspondence. His biographer Wendy Moffat’s account of the development of their romance emphasizes mutual agency, but as the one in possession of greater local linguistic and cultural knowledge, el Adl arguably exerted more control, and he resisted Forster’s sexual advances until he was assured that Forster respected him. El Adl claimed to enjoy penetrative sex as the insertive partner with both men and women; from el Adl’s perspective with respect to regional sexual paradigms, Moffat suggests, Forster’s desire to be penetrated conceded to el Adl considerable social power. The case is an interesting example of how a relationship was negotiated at the intersection of different conceptual models (Moffat 2010).

**The Japanese Empire**

Under pressure from US naval squadrons in the 1850s and 1860s, Japan opened to Western trade and culture in what is known as the Meiji Restoration, and then the country went on to found its own empire. The fissures between ideology and practice there are indicative of the complex nature of the impact of Western imperialism on homosexuality outside Europe. By the time European missionaries traveled to Japan in the mid-sixteenth century,
a relatively open urban male homoerotic subculture existed. One of its iterations, the samurai model, was characterized by anal intercourse between an older man (the insertive partner) and a younger man (the receptive partner) (Leupp 1995). In this, it somewhat resembled systems of sexuality developed in both Europe and the Arab world prior to the eighteenth century in that it was based more on roles rather than identities. In contrast with the situation in Europe, homoerotic relationships in Tokugawa Japan enjoyed moral legitimacy through their links to Buddhist monastic traditions (Leupp 1995). Influenced by Western legal codes and values after the Meiji Restoration of 1868, however, the practice of sodomy was made a criminal offense. But indictments under the law enacted in 1873 were very few; and if the institution of the statute can be attributed, at least in part, to European attitudes and law, so can its 1881 repeal, which followed French precedent (Furukawa 1994).

The samurai model flourished in Meiji schools and military academies, particularly in Tokyo during Japan's wars against China (1894–1895) and Russia (1904–1905), which marked the beginning of a half century of imperial conquest and rule. At the same time, the German academic discourse of sexology led to a flurry of discussion in academic and popular journals of a new understanding of homosexuality as a perversion affecting both men and women. Japanese thinkers and commentators actively contributed to international dialogues on the new science, and with its claim to universal truth it quickly became influential within Japan (Furukawa 1994; Pflugfelder 1999). During the period of expansion into China and Southeast Asia in the 1930s and 1940s, the prevailing official ideology was "relentlessly heterosexual and pronatal," but despite this and the pathologizing of homosexuality in the academy and the popular press, sex between men was generally tolerated by the military (McLelland 2005, 42). In this, Japan differed markedly from its European ally Nazi Germany, which actively persecuted homosexuals. After World War II, evidence emerged in a number of the published accounts of the wartime experiences of Japanese soldiers of the existence of homosexual liaisons, not only between senior and junior soldiers but also between soldiers and native men in Japan's colonies.

Some of these relationships involved coercion. One example is known through the testimony of the Philippine cross-dressing dancer Walter Dempster Jr. (1924–2005), whose experience of repeated brutal rape by Japanese soldiers during the occupation of Manila has been compared to that of the comfort women who were systematically conscripted and assaulted during the war. In 2000 his story was told in the film Markova: Comfort Gay (Dempster 2006). But consensual interracial relationships also existed. A particularly evocative example is the romantic relationship between a young wounded Japanese soldier and his Indonesian male servant related in the story "Coconut Oil," published in 1954 (McLelland 2005). While the details of accounts such as these are virtually impossible to verify, the imaginative rendering of wartime same-sex relationships is suggestive of historical reality. And given that female prostitutes were accessible through the system of
military brothels, these various inflexions of homosexual passion cannot be attributed entirely to the homosocial organization of the Japanese army. Under the influence of European ideas, Japan had imported the new identity-based model of sexology, but this existed alongside the role-based samurai tradition, which was perhaps also inflected (or perverted) in the instances of rape associated more commonly with the sexual exploitation of Asian women in the Japanese empire.

**Women, Romantic Friendship, and Gender Crossing**

The history of sexual desire and relationships between women arguably follows a different trajectory to that of men, and its study has some different emphases (Donoghue 1994); therefore, it is discussed here in a separate section. European travelers reported on homoerotic practices among women in the Ottoman Empire and elsewhere, particularly in gendered spaces such as baths and harems, but, in contrast to male homosexuality, sexual acts between women were not targeted by colonial legal prohibitions (Rupp 2009). Section 377 of the Indian Penal Code, to recall an influential example, required evidence of penetration to secure a conviction. This burden of proof has been understood to mean penile penetration. No woman has ever been convicted under the statute, although in the late twentieth century there were some newspaper reports describing cases in which mostly lower-class women applying for licenses to marry or seeking to cohabit with other women were threatened with Section 377 by their fathers or government officials (Bhaskaran 2002). The possibility of sex between women during colonial times was not believed to jeopardize the perpetuation of the imperial patriarchy. There are also few known cases of colonial regimes removing references to female homoeroticism from classical literature. One of the uncommon instances is the suppression of rekhti, a form of Urdu poetry written in the female voice that included passages that might be construed as speaking of “lesbian” desire (Petievich 2002). What, arguably, was more distinctive of women’s experiences in colonial contexts were romantic friendships and the intertwining of same-sex erotic relationships with gender crossing.

Although European women were generally less economically and socially privileged than men, the opening up of the New World after 1500 did nevertheless offer select women a greater degree of geographic mobility, and the phenomenon of romantic friendship, which empowered some women to avoid marriage and form domestic arrangements with other women, was a feature of the settler colonies of North America, as well as of European societies, especially in the eighteenth and early nineteenth centuries. The extent to which these friendships may have had erotic components is debated; at the time, little, if any, suspicion was usually attached to them. This may be represented by the response of the judges of a case brought against two schoolmistresses, Jane Pirie and Marianne Woods, in Scotland in 1811, on the evidence of one of their students, Jane Cumming. Although the pair evidently shared a bed, a majority of judges refused to believe that sexual misconduct
between respectable Christian women in Britain was possible, attributing Cumming’s allegation of female eroticism to knowledge they assumed she gained during her early years in India (Rupp 2009). It was outside Europe and North America that practices sometimes called sapphism or tribadism were thought to be endemic. In some instances, however, European writers argued that imperialism itself had instigated these practices, as in the sexological, almost pornographic work *L’amour aux colonies: Singularités physiologiques et passionnelles observées durant trente années de séjour dans les colonies françaises*, published in English in 1896 as *Untrodden Fields of Anthropology: Observations on the Esoteric Manners and Customs of Semi-civilised Peoples*. Author “Jacobus X” claimed that contact between white men and Tahitian women had introduced sapphism and masturbation, “two vices unknown to the old Tahitian women,” to the Pacific Islands by acting on local women’s “ardent” nature (1898, 2:451).

A particularly interesting category of women who ventured abroad in the modern age of empire comprised those who, in seeking to work in male occupations such as the military,

Transvestite Mary Hamilton Being Flogged in Ireland in 1746. This illustration depicts part of the punishment meted out to Hamilton, a British woman accused of pretending to be a man. Hamilton wore men’s clothing, practiced medicine, and married a woman named Mary Price before being discovered to be a woman.
attempted to pass as men, adopting what might be conceptualized as a de facto third
gender or a male social role. At least some of them desired sexual or domestic relationships
with other women. By leaving Europe they hoped not only to avoid notoriety in their local
communities but also to escape the law. From the sixteenth century on, there are examples
in European states of women being prosecuted and sometimes even executed for assuming
the role of a husband (Rupp 2009).

One of the best-known cases is that of the British woman Mary Hamilton, whose life was
sensationalized in Henry Fielding’s essay The Female Husband (1746). According to
Fielding, Hamilton was first seduced by a woman called Anne Johnson, who converted her
to the Methodist faith; then, after Johnson abandoned her, she assumed the guise of a male
Methodist teacher and embarked for Ireland. In September 1746 Hamilton was arrested at
Glastonbury where she was practicing as a physician, and where, just two months earlier,
she had married a woman called Mary Price, who claimed to have believed that Hamilton
was a man. She was charged under the Vagrancy Act, flogged, and sent to prison for six
months. In 1752 she surfaced in Philadelphia, where, again practicing medicine under the
name of Charles Hamilton, she was found to be a woman dressed as a man. However, the
Chester County authorities detained her for only a short period to allow time for a
complainant to come forward (that is, a man alleging to be the victim of deception and
fraud). It seems that no one did, and she was released, again to disappear from the
historical record. Hamilton’s case suggests that a colonial milieu, at least a relatively liberal
one such as that of eighteenth-century Pennsylvania, sometimes offered women with same-
sex desire a more secure place to live unorthodox lives (Lyons 2007).

Stories such as Hamilton’s raise the question of whether some of these cross-dressing
women might have been what are now understood as trans men. One interesting case is
that of the Swiss doctor Enrique Favez (c. 1791–1856), who was at the center of a huge
scandal in the Spanish colony of Cuba in the 1820s. Favez was born in Lausanne,
Switzerland, around 1791. His sex at birth was identified as female, but he adopted a
masculine identity when he went to Paris to study medicine; he then joined Napoleon’s
army and was captured by the Spanish. Around 1818 he migrated to Cuba, where he set up
a medical practice and married Juana de Léon. Several years later he was accused of being a
woman, and in 1823 a court in Santiago de Cuba imprisoned him for dressing as a man and
marrying a person of the same sex. Through his persistent challenges to the unfavorable
verdict of the court, however, Favez succeeded in having his sentence reduced by two-
thirds. A textual analysis of the extant primary accounts supports Favez’s insistence that he
was not an imposter and underscores that complicated debates about the mutability of
gender identity are by no means restricted to the present (Martínez 2017). Such examples
rarely appear in historical sources so it is not known how prevalent such a phenomenon
was. This brief discussion of the cases of Favez and Mary/Charles Hamilton is suggestive of
the ways in which the cultural history of women’s same-sex desire and relationships in
colonial contexts might need to be approached in different ways from that of men’s. What
their study has in common is the potential to illuminate some of the significant contours of the global history of how same-sex behaviors and identities have been conceptualized, and, in particular, to enrich the scholarly understanding of this history’s uneven development.

In summary, the four centuries following the exploration of intercontinental sea routes and the founding of the first settlements by Europeans in the Americas and Asia coincided with shifts in sexual practices, concepts, and legal regulations in Europe that were diffused around the world through imperial and colonial institutions. Significantly, this was not a unidirectional process, for these changes in conceptual understanding were shaped by the “knowledge” of American, Asian, and African societies encoded by Europeans implicated in the establishment and operation of early modern and modern empires and imperialist spheres of influence. Furthermore, non-European peoples played significant roles in these processes, not only as passive objects of representation but also as active participants in sexual acts, romantic relationships, legal proceedings, semantic negotiations, and deeds of literary censorship. In addition, it should be noted that concepts and practices predating the age of European imperialism were not simply supplanted; instead, around the world, they interacted in complex ways with the emerging sense of the modern. This variegated narrative comprises a significant strand of global cultural history. It is not, however, an exhaustive account of the ways in which the history of sexuality is related to the history of imperialism and colonialism. There are many other continental and maritime empires that might be studied. As China, to take one example, was a major imperial power for much of its history, its relative tolerance of diverse sexual practices is surely significant for the regions of East and Southeast Asia that were subject to its influence for more than a thousand years. The relationship between same-sex eroticism and these empires and others is worthy of investigation in order to better understand the history of sexuality over the last few millennia. Women’s experiences also demand further study.

The role the Spanish and Portuguese Inquisitions played in defining and policing sexuality in the New World, particularly with regard to same-sex acts and desires.

The institution known as the Holy Office of the Inquisition was first established by the medieval Roman Catholic Church to uphold orthodoxy and fight heresies such as Catharism. Extended to Latin America centuries later, the Holy Office became a significant actor in the sexual lives of those under its jurisdiction—and its records have become a key source for the history of sexuality. This entry examines the development of the Latin American tribunals and discusses their influence on the sexual lives of colonial Latin Americans, with particular attention to men’s and women’s same-sex acts and desires.

**History and Jurisdiction of the Latin American Inquisitions**

A state-linked Inquisition under royal patronage was established in Spain in 1478, largely to police the religious lives of conversos (Christians of Jewish ancestry). Portugal’s Inquisition was established somewhat later, in 1536, but with a similar intent. By the early sixteenth century, the Holy Office’s mandate included policing converts from Islam (moriscos). From 1540 on, however, the Spanish and Portuguese tribunals increasingly dedicated themselves to reforming Christian morality, especially after the Council of Trent (1545–1563). The post-Trent sixteenth-century emphasis on Christian morality produced a sustained religious focus on sexuality that would endure for centuries.

As the Spanish and Portuguese extended their dominion over America in the first half of the sixteenth century, they carried with them the authority of the Inquisition. In Spanish America, friars and bishops exercised inquisitional jurisdiction until the early 1570s, when two official tribunals were established in Lima (1570) and Mexico City (1571). In 1610 another tribunal was added at Cartagena, with jurisdiction over the Caribbean and the northern coast of South America. In 1551 the Lisbon tribunal (one of three in Portugal) was granted jurisdiction over Brazil; Brazil would never have a resident tribunal, so those accused of crimes were either sent to Portugal or tried during one of the Portuguese Inquisition’s visits to the colony (1591–1595, 1618–1620, and 1763–1769). Thus, by the
final third of the sixteenth century, formal tribunals exercised jurisdiction over much of Latin America.

Created precisely as the new emphasis on Christian morality was spreading throughout the Catholic world, the Latin American Inquisitions to some degree took jurisdiction over crimes previously governed by legal codes such as Spain's thirteenth-century Siete Partidas, which had prohibited sexual crimes such as bigamy, rape, sodomy, and abortion. The Inquisition's authority over particular crimes was complex, however, as evidenced by the example of the “sins against nature,” which comprised both sodomy and bestiality. While the Spanish Inquisition originally exercised jurisdiction over the “crime” of sodomy, for example, the Holy Office was thereafter ordered not to take action against sodomites unless heresy was involved. Only the Inquisition in the Spanish kingdom of Aragon was granted the right to prosecute sodomy; it conducted almost 500 sodomy trials between the late sixteenth century and 1700 and generally punished sodomites with severity.

Jurisdiction over sodomy in the American tribunals has been the subject of confusion and controversy. Mexico’s Inquisition prosecuted a case of sodomy among sailors in 1542, but the Mexican tribunal generally followed the Spanish practice of prosecuting sodomy only in cases where blasphemy or heresy was implicated or where clerics were accused. In practice, however, this meant that both the Inquisition and civil courts sometimes prosecuted sodomy, while the Casa de Contratación (House of Trade) in Seville claimed authority over American sodomy cases that arose at sea and in harbors. This jurisdictional ambiguity was characteristic of all of the Spanish American tribunals. In contrast, the Portuguese Inquisition exercised clear jurisdiction over sodomy—making Inquisition documents from Brazil a rich source for the study of sodomy and sexuality in Portuguese America.

The Inquisition's jurisdiction over other sexual crimes was similarly ambiguous, because most were presumed to be matters for local religious officials at the church or diocesan levels. However, whenever questions of unorthodox belief or blasphemous statements were involved (as was frequent), a sexual matter fell under the jurisdiction of the Holy Office. Fornication (sex between unmarried people), for example, was generally ignored or dealt with by episcopal authorities. In contrast, stating that a man did not sin if he paid a woman for sex was a matter for the Inquisition. The Inquisition was therefore more interested in beliefs than acts, but the two are difficult to distinguish. As a result, sex-related cases are relatively common in the archives of the Inquisition even though other authorities had the primary responsibility for managing sexual crimes.

One final jurisdictional issue is worthy of mention; by the time of the creation of the American tribunals, the Holy Office had lost jurisdiction over indigenous people, who were judged to be “too new in the faith” to be subjected to Inquisitorial discipline. Indigenous morality and sexuality were thus governed instead by bodies under diocesan (episcopal)
authority and by criminal courts, although indigenous people are a frequent presence in Inquisition documents as witnesses and, often, as participants in other illicit activities.

Originally created to police converted Jews, *moriscos*, and later heretics, the Spanish and Portuguese Inquisitions became key institutions governing the moral and sexual life of Iberians and Ibero-Americans and in the creation of a colonial sexual regime in Latin America. But the Inquisition's jurisdiction was never absolute, despite the church's ambitious vision for Christian sexual morality in colonial Latin America.

**The Inquisition and Christian Morality in Colonial Latin America**

Scholars have long disputed whether colonial Latin America was a repressive sexual regime or lax with regard to sexual morality. Not surprisingly, the Inquisition has played a key role in discussions of this question. Certainly, the Inquisition acted as a principal bulwark of the Christian sexual regime, which permitted only one model of Christian sexual morality. In America, the one licit model of Christian sexuality was implemented on a vast and diverse population comprising indigenous people, free and enslaved Africans and their descendants, and European colonists—a process described as “the colonialism of vaginal intercourse” (Sigal 2009, 1341). While Inquisitors lacked the nineteenth-century terms *sexuality*, *heterosexual*, or *homosexual*, they nonetheless possessed a clear concept of “licit” sex and a number of terms and categories (sometimes imprecise) into which illicit sex acts could be grouped for condemnation and punishment.

As suggested above, the colonial ideal of Christian sexuality was “heterosexual”; but proper sexual conduct took place not merely between a man and a woman but also within holy matrimony. Even within marriage, heterosexual coitus in the “improper vessel” or the “vessel against nature” (anal intercourse) was strictly forbidden and policed in the confessional. Sexual sins were thus multiple, and there was a rough consensus on their severity. Sacrilege (sex with a nun or priest) was the gravest sin, followed by incest, adultery, rape of a virgin, concubinage (living together without marriage), prostitution, and fornication. As discussed above, the Inquisition lacked jurisdiction over most of these matters. More clearly a matter for the Holy Office was the use of sexual magic to attract, keep, and “tame” lovers—or even, in the cases of prostitutes, to bewitch clients—because these practices often involved blasphemy or even implied demonic pacts. In addition, the Inquisition was interested in the sexual promiscuity and beliefs often involved in heresies such as illuminism (*alumbradismo*), the belief in indirect enlightenment from God rather than through the intercession of the church. The potentially heretical erotic visions of female mystics also received attention. Finally, the Inquisition dealt with priests who used the confessional as a place to make sexual advances toward male or female penitents.

In this comprehensive field of sexual sin, however, the gravest offense was sodomy,
generally referred to as the *pecado nefando* (nefarious sin). Described by the jurist Gregorio López (1496–1560) as worse than heresy, sodomy was in the Portuguese world often treated as if it were heresy, despite the clear distinction between the crimes. Sodomy, masturbation, and bestiality were together considered the “sins against nature” because they were nonprocreative and supposedly violated both the “natural order” and God’s commandment to be fruitful and multiply. Sodomy and bestiality, indeed, were often lumped together in confessional manuals and legal codes. Sins against nature were an expansive category, however; the Spanish theologian Bartolomé de Medina (c. 1528–1580), for example, wrote that even sexual intercourse with the woman on top of a man constituted sodomy because such a position was unnatural.

Sexual sins, while ubiquitous in colonial Latin America, had their own geography, with bestiality clearly associated with rural areas and sodomy and prostitution more associated with urban areas. Some scholars argue that rural people were probably persuaded to avoid sodomy because of the lack of private places, whereas others have found sodomy established even in rural settings. Regardless, sexual sins appear to have thrived in private and controlled spaces—one possible reason that elite groups with access to such spaces, such as priests, may have been particularly likely to sin. Still, even plebeians had access to some private spaces, such as New Spain’s *pulquerías* (taverns) and *temascales* (steam baths), which offered ample opportunity to “sin” away from the prying eyes of the public.

Assessing the repressiveness of the Inquisition and the colonial sexual regime in general is a complex matter. As a powerful institution of social control, the Inquisition fought to varying degrees against all the practices and beliefs enumerated above. Yet the Inquisition was just one part of a complex social fabric of belief and sin. The Holy Office worked with other systems of social control such as confession (required once a year since the Fourth Lateran Council of 1215). Indeed, in its procedures, the Inquisition was not merely a mode of “violent repression” (Zbíral 2010, 218) but precisely followed the norms and practices of sacramental confession, in which sexuality was often a “privileged theme” (Harrison 2014, 118). Thus, it has been argued that the sixteenth century brought a new sexual regime as a result of regular confession and a clearer notion of sin. This regime in turn complemented the work of the Holy Office. Self-policing (either before or after illicit acts) was a potent tool for the Inquisition, and it is not possible to understand the role of the Inquisition in policing sexuality without understanding the “general attitude of guilt and fear of punishment” characteristic of the time (De Los Reyes 2010, 60). To some degree, then, the Inquisition can be seen as an enforcer of community standards. Within the confines of these standards, individuals navigated between their own desires and impulses and the teachings of their religion.

In an apparent paradox, given the repressiveness of the Inquisition’s intent, its archives are replete with evidence of heterodox behaviors. This suggests that whatever its intent, the Inquisition failed to produce ideal Christian sexual morality. One reason for this failure is
the vastness of the American territories and the extreme diversity and mobility of the colonial populations. In addition, the American Inquisitions themselves were uneven in their approach to sexual sins. Despite its clearer jurisdiction over sexual matters, for example, the Portuguese Inquisition was less interested than the Spanish in policing sexual crimes, particularly in Brazil. Even in Spanish America, periods of relative toleration could alternate with periods of harsher repression; the period before 1621 seems to have been generally less repressive than that between 1621 and 1720, when the church was most functional as an instrument of social control. Overall, then, the colonial Latin American sexual regime was neither lax nor repressive but offered a mixture of prohibition, disapproval, and tolerance.

Sodomy: The *Pecado Nefando* and Latin American Criminal Courts

In Mexico City in 1658, a laundress reported that she had been washing clothes near a ditch when two boys ran to her to report two men “playing like dogs” nearby. When she investigated, she witnessed what seemed to her a clear act of sodomy (Lewis 2007, 129). One of the men involved would later be among fourteen men put to death after a large-scale investigation by Mexico’s Real Audiencia, its highest criminal court. Over 100 men were accused of sodomy, described by authorities as a “cancer” infecting the kingdom (Garza Carvajal 2003). Despite the clear legality of secular jurisdiction in this case, some clerical authorities protested, believing that the gravity of the sin demanded the Inquisition’s involvement. This case thus showcases some of the key issues concerning the Inquisition’s involvement with sexuality, including both the importance of sexuality to Christian conduct and the often limited reach of the Holy Office. This section discusses how sodomy generally did not fall under the jurisdiction of the Inquisition (except in Brazil) but was prosecuted by secular criminal courts. Thereafter, two other issues are examined: the role of gender in sodomy trials and accusations and the question of sexual subcultures in colonial Latin America.
In the medieval and early modern world, *sodomy* had a much more expansive definition than that of the twenty-first century. The term could refer to several nonprocreative practices, including anal intercourse, oral sex, and the penetration of the vagina by anything but a penis. Thus, sodomy was not inherently “homosexual,” as three modes—male/male, male/female, and female/female—were distinguished. It has therefore been suggested that the Portuguese Inquisitors were interested not in sexual preference or orientation but rather in acts. However, male-male relations and anal sex tended to be viewed most harshly. For example, the first bishop of Mexico, Juan de Zumárraga (1468–1548), concluded that the male-female form of sodomy was less sinful than the male-male form (Nesvig 2001). Over time, anal intercourse between men came to overshadow the other forms of sodomy, and in practice, prosecutions of heterosexual sodomy were rare. Nonetheless, the gravest sodomitical sin was “complete sodomy,” in which a man ejaculated in the rectum of his partner; this, rather than sexual orientation per se, was the index of the sin’s severity.

Most scholars of colonial Latin America feel that sodomy took on additional significance in the colonial setting. Indeed, the elimination of indigenous sodomy became a key feature of colonial practices, particularly because sodomy was often thought of as something taught to indigenous persons by the devil or other demons. While the Inquisition did not directly participate in the “extirpation” of indigenous sodomy, the Holy Office nonetheless stood as the model for and enforcer of the Christian sexual regime.
Because sodomy developed in a male-dominated society that discriminated against women and femininity, those accused of the *pecado nefando* were often inherently feminized. Moreover, some scholars have argued, "active" (insertive) partners in intercourse were sometimes treated differently from "passive" (penetrated) ones. The passive-active distinction has fueled much of the scholarship on sodomy in colonial Latin America, although there is increasing evidence that the distinction was not as meaningful as previously thought. For example, both "actives" and "passives" were apparently punished with equal severity in the absence of compulsion, and men who presented evidence of forcible penetration were often exonerated.

Moreover, the question of "feminization" is more complex than some scholars have suggested. First, many men accused of sodomy were married to women and thus fulfilled the masculine gender role. Even within same-sex relationships, gendering was more fluid than has been assumed. For example, the seventeenth-century Mexican mulatto Juan Ramírez was described as someone who ground corn, made chocolate, shopped for food, and washed clothes—all traditionally feminine tasks—*and* as the insertive partner in sex (Lewis 2007). An insertive ("active") partner might therefore be highly effeminate to the extent of assuming a female social role. Conversely, although the sexual act of sodomy was often described as a man’s "serving as if he were a woman,” a man might be passive *sexually* and yet retain the *social* role of a man with regard to his sexual partner. Thus, it seems increasingly clear that despite the importance of metaphors drawn from male-dominant heterosex, these metaphors "do not always map neatly onto male-male sexual interaction" (Nesvig 2001, 691). Still, feminization remains significant, and it seems that many sodomites did adopt feminized modes of dress and activities.

Sodomy, like other sexual acts in colonial Latin America, occurred within a general context of unequal relations, not only between men and women but also among classes and races. To some degree, wealthy, elite, and clerical men (almost all of whom were of Iberian descent) could protect themselves from punishment or infamy when accused of sodomy. Sodomitical priests in particular were often treated leniently. In a 1595 case from the Real Audiencia of Charcas, for example, a clergyman convicted of sodomy was able to escape punishment because of his status and connections, whereas at least one of his plebeian lovers was executed (Spurling 1998). Priests were tried by religious authorities, who sought to avoid the scandal associated with severe and public punishments and who were conscious of the perennial shortage of clerical personnel. Almost never were clergy punished as harshly as normal plebeians accused of similar offenses.

Even in the case of laymen, however, one should not assume that sodomy was always prosecuted harshly or that the occasional brutal repression of the practice succeeded in eliminating it. There is ample evidence that sexual subcultures flourished, although there is much disagreement on how they should be described. Some refer to them as "gay " or "sodomitical" subcultures, whereas others claim the impossibility of such identities before
the nineteenth-century invention of homosexual (and heterosexual) identities. Whatever the case, occasional statements that suggest social tolerance of same-sex behavior are one of the most interesting features of Inquisition trials involving sexual practices such as sodomy. Certainly, criminal and religious authorities in colonial Latin America exerted unquestionable and brutal power over men who had sex with men. However, both the presence of sodomitical subcultures and the assertions of heterodox ideas about sodomy should caution against overstating the success of religious or secular institutions in extirping same-sex relations.

**Women and Sexual Heterodoxy**

The Holy Office and other bodies policed women’s sexuality as well as men’s, but women’s sexual misdeeds were generally fewer and more likely to be matters for confession rather than prosecution. The sexes were equally represented in concubinage and fornication, for example, but evidence of women’s more serious sexual crimes is scant. And, as this section shows, even same-sex behavior among women was poorly understood and often dismissed, unless it involved insertion or some form of “hermaphroditism.”

While women could theoretically be accused of sodomy, this was rare. Some sixteenth- and seventeenth-century Spanish commentators wrote that coitus between women was not as offensive as male sodomy, because it neither dissipated semen nor offended the image of God. This meant that women should be punished lightly for same-sex relations, unless they used some sort of instrument to copulate. Perhaps even more importantly, commentators were baffled by female sodomy and whether it involved penetration and ejaculation. Given the emphasis on sodomy as “insertion,” it is not surprising that female genitalia were occasionally examined to ascertain, for example, whether an enlarged clitoris could be used as a phallus (Few 2007). However, such cases are rare. In the absence of evidence of penetration, prosecuting authorities and complaining neighbors often had to resort to circumstantial evidence of women’s romantic relationships and gender inversions: hence the use of terms such as *illicit friendship* rather than sodomy in the rare female cases prosecuted. Male officials’ confusion about and disdain for female sexuality meant that same-sex activities between women were, from the perspective of the Holy Office of the Inquisition, effectively decriminalized if not licit. Therefore, for Spanish America in particular, there are far fewer traces of specific female same-sex acts and named desires than in the case of men. The relative inattention to female same-sex relations can be seen even in cases where women volunteered information about acts including kissing, touching one another’s breasts, and reaching orgasm. This may mean that Spanish American women were relatively free to express moderate levels of same-sex eroticism within intimate relationships.

Although the Portuguese Inquisition prosecuted at least twenty-nine cases of female sodomy in Brazil, Brazilian authorities also struggled with the concept of female sodomy.
Indeed, in 1646, Brazilian female sodomy passed from Inquisition jurisdiction to that of secular courts, in large part because of internal controversy and confusion. In both Brazil and Spanish America at the end of the colonial period, then, “female sodomy” was still a topic of minimal interest and maximal bewilderment.

Inquisitors’ relative lack of interest in female same-sex activities might lead one to assume that women’s sexual transgressions were simply unimportant to the Inquisition and other authorities. However, Inquisition cases do reveal intervention in other areas of women’s sexuality, including the “unnatural” sin of masturbation. Masturbation was normally a matter for confession with one’s priest but might reach the attention of the Inquisition in specific cases, such as those involving blasphemous sexual fantasies or masturbation in church. The connection among heretical beliefs, religious fervor, and “unnatural” sexual behaviors such as masturbation was not lost on Inquisitors. Overall, however, neither the Inquisition nor other authorities paid sufficient attention to women’s sexuality to generate the rich detail (and harsh punishments) seen in the trials involving male sexual behavior.

In sum, the Inquisition was a significant force in the creation of Latin America’s distinctive colonial sexual culture. Only one of many religious and secular institutions charged with policing the sexual lives of the diverse colonial population, the Holy Office nonetheless played an important role in establishing and defending a model of ideal Christian sexuality in the Portuguese and Spanish colonies. But despite the power, secrecy, and occasionally draconian punishments associated with the Inquisition, exemplary Christian morality remained elusive. The colonial Latin American sexual regime, then, was highly ambivalent. This remained true after the establishment of independent Latin American nations in the nineteenth century, when new penal codes eliminated many of the old sexual crimes, including the nefarious sin of sodomy.

Institut Für Sexualwissenschaft

HEIKE BAUER
Senior Lecturer, English Literature and Gender Studies Birkbeck University of London, United Kingdom

*Pioneering institute for sexual research founded by the famous German sexologist Magnus Hirschfeld.*

The Institut für Sexualwissenschaft (Institute for Sexual Science) in Berlin was the first of its kind when it was founded in 1919. It is today most closely associated with the work of one of its three founders, the Jewish doctor and homosexual rights activist Magnus Hirschfeld (1868–1935). The other cofounders, the psychiatrist Arthur Kronfeld (1886–1941) and the dermatologist Friedrich Wertheim, have remained in Hirschfeld’s shadow, not only because he was one of the most famous sexologists of the time, but also because it was his many sexual reform initiatives that helped to set up the institute's intellectual and financial structures.

© SUEDDEUTSCHE ZEITUNG PHOTO/ALAMY
Magnus Hirschfeld, Cofounder of the Institut für Sexualwissenschaft, 1928. Both a doctor and a
Hirschfeld published his first treatise on same-sex sexuality, *Sappho und Sokrates* (Sappho and Socrates), in 1896, not long after completing his medical qualification. The following year he cofounded the Wissenschaftlich-humanitäres Komitee (Scientific-Humanitarian Committee), which campaigned for the decriminalization of homosexuality in Germany, and in 1899 he launched the journal *Jahrbuch für sexuelle Zwischenstufen* (Yearbook for sexual intermediaries), which supported the same cause. The term *sexual intermediaries* in the journal's title references one of Hirschfeld's major theoretical claims: that there exist infinite variations in bodies, genders, and desires, as well as in the intersections between them. A second major intervention came in 1910 when Hirschfeld coined the term *transvestite* to distinguish this gender-based identification from the, by then, more established sexual identity of the homosexual.

Hirschfeld collaborated with an international group of scientific colleagues, medical professionals, and activists. In 1919 he gathered many of them together to found the Institut für Sexualwissenschaft. Taking advantage of the sociopolitical changes wrought by World War I (1914–1918), Hirschfeld purchased an imposing building in the Tiergarten area of Berlin, on the corner of In den Zelten and Beethoven streets. It was here that the institute was inaugurated on 6 July 1919. Extended in 1921, the building provided space for medical research, consulting rooms, a library, an exhibition hall, and a public lecture theater.

**“Transvestites” Work**

The Institut für Sexualwissenschaft was in many ways the first LGBTQI archive, a place in which certain kinds of information were formally collected, stored, and analyzed. If this archival work anticipates the development of later LGBTQI library collections, it was only part of the wide range of activities, private and political, of the people who worked and lived at the institute. Hirschfeld and his colleagues aimed to realize a new kind of sexology, one that would be open to all members of the public and use science, including eugenics, to bring about greater social and sexual justice.

The institute's medical wing specialized in supporting people whose gender did not match their body, pioneering a range of hormonal treatments and surgical procedures with the aim of setting itself up as the leading place for *Genitalumwandlung* (which literally translates as “transformation of the genitals”) operations. A team of experts, including Felix Abraham (the institute's specialist in transvestism), the endocrinologist Bernard Shapiro, and the gynecologist Ludwig Levy-Lenz, worked together, sometimes with surgeons from other hospitals such as Erwin Gohrbandt, to perform some of the first gender realignment surgeries. One of their most famous cases was that of Dora, born Rudolph Richter and also
known by the diminutive Dorchen. Dora was referred to the institute by a judge after an arrest for cross-dressing. She received extensive medical treatments to complete her “sex change.” More unusually, perhaps, she was also offered employment at the institute, where she served as a maid until its closure in 1933.

**Sexual Intermediaries in the Frame**

Supporting people such as Dora, whose existence was criminalized beyond the immediate remit of the clinic, was an important part of the institute's sexual reform mission. Many of Berlin's cross-dressers and other “sexual deviants” visited the institute. A large archive of photographs documents the institute’s connection to the various subcultures of the time. Some of this photography crudely exposed the subjects to the gaze of medical experts and lay viewers. Close-ups of the genitals of intersex people, for example, were displayed at the institute and on portable so-called sexual intermediaries panels used in public talks—a visual aid that aimed to illustrate the argument that there exists an infinite number of gender variations. If these photographs treated their subjects as dehumanized objects of study, some same-sex couples, cross-dressers, and other queer folk came to the institute to pose for self-consciously staged pictures. The institute's photographic collection thus contains evidence of both medical practices that turned people into case studies and a more affirmative relationship between such scientific photography and Berlin’s sexual subcultures whose constructions of self thrived in and beyond the institute.

**Domestic Life**

In addition to providing work and exhibition spaces, the institute was also a home. The building was divided into living quarters that housed some of the institute's professionals—including Hirschfeld and his partner, Karl Giese (1898–1938)—as well as temporary and more permanent lodgers, many of whom were attracted to the institute precisely because of its reputation as a gathering place for homosexual women and men. The English archaeologist Francis Turville-Petre (1901–1941) and the American writer Christopher Isherwood (1904–1986), for example, rented rooms at the institute from where they felt free to engage in relationships with other men. Famously memorialized in Isherwood's autobiographical account titled *Christopher and His Kind* (1976), the two men, like other visitors, such as the poet W. H. Auden (1907–1973), experienced the institute as a liberatory space that allowed them to meet, live, and celebrate homosexual culture. Here the boundaries between private and professional life frequently became blurred, not only in Hirschfeld's friendships with the institute tenants but also in domestic arrangements such as those in the Turville-Petre household, which employed two male servants who became the lovers of Turville-Petre and Isherwood. Unlike that of the transgender maid Dora, who remained somewhat apart from her employers, separated by the boundaries between doctor and transgender patient, employer and maid, the lives of the homosexual
servants—a man called Erwin Hansen and one known only by his first name, Heinz—became intimately intertwined with those of their employers.

**A Home for the Left**

The institute attracted not only queer and transgender people. Several prominent thinkers and activists on the left lived in the building at certain points in time. Hirschfeld's widowed eldest sister, Recha Tobias (1857–1942), who had an apartment at the institute, rented out some of her rooms, first to Walter Benjamin (1892–1940) and then, after Benjamin left, to Ernst Bloch (1885–1977). Other rooms were taken up by Willi Münzenberg (1889–1940), the press officer of the Communist Party of Germany and a member of parliament who, together with his partner, the activist and publicist Babette Gross (1898–1990), organized many meetings of the Komintern (Communist International) from the institute. For Münzenberg, Benjamin, Bloch, and other radicals on the left, the institute seems to have mainly functioned as a convenient place to live where they could go about their intellectual and political life without interference. While they did not get directly involved in the sexual reform activities—suggesting that sexual reform and left-wing politics often ran in parallel even when they came into close physical proximity—they nevertheless benefited from the institute's climate of tolerance and its reform-oriented mission.

**Eugenics**

The institute was, however, by no means a place only for intellectual elites or sexual subcultures. It soon became an integral part of life in 1920s Berlin. Next to supporting people who felt that their desires, bodies, and genders challenged the norms of the time, the institute reached wider audiences via its marriage advice and birth control services. It is this work that perhaps most clearly indicates what are today considered the limits of some of the work undertaken at the institute: it was strongly framed in eugenicist terms. Like many other social reformers and political activists, the institute's sexual scientists considered eugenics a means of progress, capable of developing a better, healthier future society. The significance of the institute’s eugenics mission is sometimes minimized because it was not overtly racialized. Yet there can be no doubt that the institute deployed a racialized language of progress when it encouraged reproductive practices that favored a heteronormative view of the world. Homosexuals were discouraged from marriage and reproduction on the grounds that they would likely produce “degenerate” offspring. Such ideas were disseminated not only within the clinic and counseling services but also in hugely popular public events. The institute hosted, for example, public “questionnaire evenings,” which encouraged members of the public to anonymously submit their questions about sex. A member of the institute staff would then answer these questions in a public talk. These sex-education events were complemented by private marriage counseling services and birth control advice.
This work stood in close, and sometimes uneasy, proximity to the growing feminist efforts of the time. The radical feminist activist Helene Stöcker (1869–1943), who in 1905 cofounded the Bund für Mutterschutz und Sexualreform (League for the Protection of Motherhood and Sexual Reform) and a related journal, Mutterschutz (Maternity protection; later renamed Die Neue Generation [The New Generation]) was an ally of Hirschfeld’s, supporting the decriminalization of homosexuality, while Hirschfeld in turn joined campaigns calling for the reform of marriage and antiabortion laws. Stöcker, like many of the institute’s sex reformers, promoted eugenics as a way of protecting racial health.

Nazi Backlash

The institute’s location in Berlin put it physically and symbolically at the center of both the German homosexual liberation movement and the efforts to suppress homosexuality in the country. Given the institute’s popularity, its support of homosexual and transgender people, and the fact that many of the practitioners, Hirschfeld included, were Jewish, it comes as no surprise that the institute became a point of attack soon after the Nazis came to power in January 1933. Hirschfeld had long ago fled into exile by that stage, but the institute continued to function under the general direction of Giese, who was responsible for the large archive, and the administrative support of Friedrich Hauptstein. From exile, Hirschfeld retained the directorship despite an attempt by Shapiro, who had remained at the institute, to take it over in 1933. During the early months of that year, threats against the institute intensified. On the morning of 6 May 1933, a Saturday, Nazi students entered the building and ransacked the library. They were joined in the afternoon by members of the Sturmbteilung (Assault division), the paramilitary wing of the Nazi party better known by the abbreviation SA, who removed books and other materials from the library and other parts of the institute. This material was set alight four days later on Berlin’s Opera Square, an event that inaugurated the infamous Nazi book burnings and marks the end of the Institut für Sexualwissenschaft.

Role in LGBTIQ History Today

After World War II (1939–1945) the Institut für Sexualwissenschaft became a symbol of progressive thinking and hope for reform. Today, it is considered a key institution in the history of the struggle for homosexual rights and transgender visibility. It also serves, however, as a reminder that this history has its own boundaries and exclusions: not only was the domestic life of the institute organized in fairly conventionally classed and gendered terms, it was largely a white space whose existence, like that of other medical and scientific research facilities in 1920s Germany, benefited from the country’s colonial expansions around the turn of the previous century. This unacknowledged debt filtered into research at the institute and not just via the support of eugenics. For example, the institute’s sex education journal Die Aufklärung (the title literally translates into English as
“the enlightenment,” but in German it could also mean “sex education” more specifically, which was coedited by Hirschfeld and the anthropologist Maria Krische (1880–1945), published many articles on sexual anthropology that perpetuated racial stereotyping. Although the Institut für Sexualwissenschaft has been claimed by many LGBTQI activists and educators as the radical birthplace of modern homosexual rights activism, its history also indicates that homosexual liberation in the West was often oblivious to classed and racialized oppression, and not a struggle for social justice per se.

**BIBLIOGRAPHY**

A critical analysis of the role of the internet in relation to LGBTQ identities and activism in Africa presents a geographical and social paradox. Africa is a continent of fifty-four individual countries, within which there is an incredible diversity of individuals and communities whose experiences are not generalizable. It is, however, beyond doubt that the internet and social media has revolutionized everyday experiences of being LGBTQ in Africa.

Africa has experienced rapid penetration of internet access, and social media has become a vital tool for LGBTQ people in Africa to make sense of their sexualities, establish intimate relationships, and engage in individual or collective activism. However, their digital existence has brought several challenges to their ordinary daily experiences. Digital spaces have also radically reshaped scholarship about African sexualities.

### Internet Access

In the twenty-first century, Africa has experienced a rapid rise in access to the internet because of urbanization, penetration of mobile phones over fixed lines, affordable smartphones, and infrastructure such as Wi-Fi, mobile broadband, and fiber-optic technology. Access to the internet and to social media varies across the continent. More advanced African economies such as Nigeria and South Africa have higher rates of internet use than smaller economies such as Malawi and South Sudan. Yet, internet penetration in Africa remains low overall, with only approximately one-third of Africa’s population having access to the internet. Most internet users are urban middle class. Access to social media, including the popular platforms Facebook, WhatsApp, Viber, and Twitter, remains limited as a result of unaffordable mobile internet data charges, poor or slow internet reception, and limited wireless internet infrastructure. Access can also be limited by government restriction of social media and other internet communications tools through repressive laws and regulation, covert surveillance of internet communication, crackdowns on users, or network shutdowns.

### The Internet and LGBTQ Visibility
In African communities, most LGBTQ populations are invisible as they are driven underground owing to stigma, discrimination, and repressive laws that put them at risk of social exclusion or persecution. It remains a rare occurrence to see a nonconforming person in most African public spaces. There are very few public spaces where LGBTQ persons can freely convene as a group. This invisibility has sustained the biggest myth—that homosexuality does not exist in Africa.

The internet has provided an alternative space for existence without the societal restrictions that come with physical spaces. The digital spaces are portable through mobile handsets. One can switch on the handset to enter the internet and switch off to exit at will. Social media has allowed LGBTQ people to create profiles and interact with others within their communities and beyond. For example, they have been able to open accounts on Twitter, Facebook, or Instagram and interact in their own rights as nonconforming citizens, with an option to reveal or anonymize their sexual identities. Such platforms have opened doors to the world and potentially opened the world to them.

The internet and digital spaces have also increased opportunities for dealing with the process of self-awareness and self-acceptance. For most LGBTQ Africans, discovery of their sexuality is a stressful and lonely process because they usually do not know other LGBTQ individuals personally and have no alternative sources of information. This lack of information is even more critical in the rural areas. The internet has availed a wealth of information for them to learn about their sexuality. Through social media they have been able to discover others—and discover that they are not alone. They have approached others for sexual advice and insight. They have also been able to seek out and connect with friends and partners. They have been able to join local or international groups and find a community to belong to. Through this interaction, they have made sense of their sexual identities and communities.

The digital spaces cannot be imagined as separate from the physical spaces. The cyberspace connections have opened a gate to the physical spaces. LGBTQ communities have shared information about safe spaces and services available for local needs. For example, through their connections on WhatsApp or Facebook, LGBTQ people have been invited to residential gatherings or to events and celebrations at other safe public spaces. They have access to information on areas or places that are not safe, sexual health services, or how to avoid threats of homophobia or blackmail. Importantly, LGBTQ persons have been part of the birth of the African internet, meaning their place in digital Africa is not an “import.”

**Coming Out**

Through social media, LGBTQ Africans have showcased their identities by declaring and publicizing their sexuality, sharing their photos, telling stories about their lives, and sharing their worries and hopes. The option of choosing between anonymity and publicity through
profile restrictions has enabled them to restrict access to information about their sexual lives. They have innovated strategies for avoiding homophobia by setting up multiple social media profiles in order to tailor membership for appropriate audiences. In this way, they may, for example, have a profile without their same-sex sexual identity for use in connecting with their relatives or friends whom they do not want to know about their sexuality. However, this dual identity has been viewed, even at times by LGBTQ individuals themselves, as a faking of their identity. Coming out on social media has been viewed as a safer option than revealing sexual identities in physical spaces. Social media reduces the risk of physical violence. Others, however, have suffered verbal abuse and threats when they revealed their sexual lives on social media.

**LGBTQ Activism and Social Media**

LGBTQ persons have taken advantage of social media as a platform for individual and collective activism to enhance their visibility and fight for their rights. At the individual level, they have raised topical issues and worked to mobilize a consensus to call for change. At the collective level, they have established movements and organizations on Facebook, Twitter, and Instagram. Unlike what occurs with physical organizations, organizing through social media is convenient because there is no need for formal registration with the government, and there is a reduced risk of being shut down by authorities. LGBTQ people have been able to join formal organizations that have a social media presence, both locally and internationally. Through such platforms, they have reported incidences of violence and other forms of homophobia to seek support and to demand justice.

Because they view online spaces as safer spaces, LGBTQ persons have been willing to approach likeminded organizations and service providers for help. Online access to services has increasingly become a critical component of the response to HIV/AIDS. For example, service providers have disseminated behavioral change messages through social media, text messaging, and other mobile phone technologies in Kenya and Uganda. In Ghana, an online help line has enabled men who have sex with men (MSM) to connect with service providers to access referrals for HIV testing, treatment, and prevention services. In 2013, for example, a local program reached 15,440 MSM through social media. In Malawi, LGBTQ communities have created secret social media pages to share information directing LGBTQ persons to user-friendly services available in their communities, as well as directing them away from homophobic hot spots.

There have also been increases in online petitions calling for greater protection of LGBTQ persons, news alerts about the persecution of LGBTQ persons, calls for participation in causes, and the sharing of messages about LGBTQ rights. Closed groups have allowed the participation of those who remain closeted or those who prefer to participate confidentially. Some of the social media groups are open to LGBTQ members only, for safety and privacy, whereas others are open to the public. Because the majority of LGBTQ
Africans remain closeted or are uncertain about the repercussions of coming out, closed spaces are proving an effective way to mobilize those who may not otherwise participate in activism. Increasingly, LGBTQ allies are also speaking out against stigmatization, discrimination, and violence directed toward LGBTQ persons.

Social media brings an advantage for hosting social movements because it is cheaper and more convenient than organizing through physical premises and equipment. Events or protests can be hosted without the need for members to physically attend. The circulation of information or updates to constituencies is instant, without the need to print and ship handouts. Messages can be transmitted for free. Movements have been able to consult their constituents through online questionnaires without the need to book a venue and hold a half-day meeting. They have also been able to showcase their work without needing to wait for the end of the year to do an annual report. In other words, they can share instant messages to facilitate change. The internet and social media have also provided platforms to connect local movements to their international counterparts. Increasingly, LGBTQ Africans are able to take advantage of such opportunities as online training, virtual participation in international conferences, and accessing current information materials.

Challenges

While social media has brought opportunities to LGBTQ persons, it is not without challenges. First, it remains a space dominated by heteronormativity in which people who do not conform are policed and regulated. LGBTQ persons have been insulted, ridiculed, or threatened for their sexuality on the internet. In other cases, they have been traced to their physical location, where homophobes have verbally or physically attacked them.

Second, while there is a reduced risk of physical attack on social media, many people have suffered verbal abuse and threats on the internet. LGBTQ persons have been blackmailed by those who threaten to reveal their sexual orientation to their employers, church, or families. Others have been lured into dates that have ended in physical assault and even death. LGBTQ social media groups have been infiltrated, resulting in lists of gay persons being revealed to the public. Some of these cases of revelation have led to arrests and prosecution. Police have cited the internet as a space where they have an opportunity to spot and trace LGBTQ persons for prosecution.

Third, where there is no coordinated moderation in the quality of information related to HIV/AIDS services, there is a risk of misinformation about the location of service providers or guidance about treatment. There is a potential for people to access the wrong information that may be harmful to their welfare.

Fourth, while social media has revolutionized the way LGBTQ persons live, interact, and engage in activism, participation is still dependent on who has access to the internet. For
example, access to social media is higher among the younger, urban, literate, and middle-class populations. It is also influenced by the extent to which local areas have access to internet infrastructure and facilities. The elderly, poor, rural, and less-educated remain marginalized from internet communities.

Fifth, glamour presented in some gay media sites has idealized the gay subjects as the middle-class white male with a perfect body image. It has also idealized specific cities and countries as gay havens. As a result, some LGBTQ Africans aspire to emigrate to the “havens” rather than struggle for equality in their country of origin. Africa has lost several potential leaders in the fight for equality and human rights to the West.

Sixth, the increase in online activism has also been perceived as a risk to more visible forms of protest and demonstration happening offline. For example, submitting an online petition to an African parliament may not be as effective as submitting a physical one, as some state institutions continue to work with hard copy rather than online documents. Government institutions continue to have limited access to the internet. In some cases, officials are not very well conversant with social media. Politicians have also trivialized internet activists.

Scholarship
The internet has revolutionized how contemporary scholarship about African sexualities is conducted. Digital spaces are a modern research field with vast amounts of data, including broad access to research populations. Understanding the future of African sexualities will require inclusion of the digital discourses in scholarly analysis. The key issues will include digital sexualities, online violations, managing big data, digital economies, and struggles for equality.

The internet and social media have revolutionized communication, information sharing, social interaction, relationships, and activism by LGBTQ Africans. The internet has opened access to information through which LGBTQ Africans have interpreted their sexual and gender identities. Facebook, WhatsApp, Twitter, and Viber have enabled LGBTQ Africans to navigate the virtual spaces, whether publicly or privately, to be introduced to their local communities, join groups and causes, connect with new friends, and pursue sexual relationships. Importantly, they have found new ways to take a more prominent role in activism about issues that matter to them.

Internet freedoms have also come with regulation and policing by the state. Since 2015, countries that have executed internet shutdowns include Uganda, Algeria, the Republic of the Congo, and Ethiopia. For example, in 2017 the government of Cameroon shut down the internet for three months in the English-speaking region following public protests. The reach of the internet or social media remains exclusive to those with access to it. Currently, most Africans have no access to the internet, whether they are LGBTQ or not. If internet and social media access is restricted to only a privileged few, there is a risk that such virtual existences are superficial in their representation of the lived experiences of LGBTQ Africans, especially in areas of internet blackouts.

Matters of sex and sexuality remain shrouded in secrecy and silence in most African societies. However, the internet and social media have brought new opportunities for LGBTQ people to negotiate sexual rights and freedoms.

Internet Queer Sites in the Middle East

JEDIDIAH ANDERSON
Visiting Assistant Professor of Arabic
Furman University, Greenville, SC

Descriptions of various current and defunct websites and blogs dealing with LGBTQI issues in the Middle East.

The internet is and has been an extremely important nexus of communication for LGBTQI people both in the Arab world and outside it. Beyond mere dating sites, the internet has also provided new and productive opportunities for activism and a means by which activism is deployed for LGBTQI individuals and their communities. Some of the most notable websites for LGBTQI activism have been Al-Fatiha (Opening), Muscat Confidential, Aswat (Voices), and the online magazine Barra (Out). While this entry discusses the above sites and their role in shaping Middle Eastern queer discourse, it also examines the importance of social media in allowing the LGBTQI community in the Middle East and North Africa region to connect and organize, as well as other websites that were inspired by the aforementioned websites, as three of those four (Al-Fatiha, Muscat Confidential, and Barra) are now defunct.

Al-Fatiha

Al-Fatiha (Arabic for “opening”; also the name of the first chapter of the Qur’an) was founded by Faisal Alam, “a queer-identified Muslim activist of Pakistani descent,” in 1997 as “an organization for lesbian, gay, bisexual, transgender, intersex [and] questioning (LGBTQI) Muslims, and their allies” (Alam 2017; see also Mastracci 2016). Alam stepped down from leading the organization in 2004 in order to pursue his own independent activism, and the organization was dissolved in 2011 (Mastracci 2016). While Al-Fatiha no longer exists as an organization, there is a large number of splinter groups that have risen in its place in order to address the issues that LGBTQI Muslims face. Two of the most notable ones are Muslims for Progressive Values (MPV) and the Muslim Alliance for Sexual and Gender Diversity (MASGD).

Describing itself as “a faith-based, grassroots, international human rights organization that embodies and advocates for the traditional Qur’anic values of social justice and equality for all, for the 21st Century” (MPV 2017b), MPV provides services, such as same-sex Muslim weddings, and drafts of sermons that express the values of MPV. MPV also has consultative status at the United Nations and “monitors human rights issues in Muslim-majority
countries related to women's rights, nondiscrimination of LGBTQI peoples, freedom of and from religion and freedom of expression” (MPV 2017a).

The MASGD describes itself on its website as an organization that “works to support, empower, and connect LGBTQ Muslims. We seek to challenge root causes of oppression, including misogyny and xenophobia. We aim to increase the acceptance of gender and sexual diversity within Muslim communities, and to promote a progressive understanding of Islam that is centered on inclusion, justice, and equality” (MASGD 2017). The organization publishes policy statements on its website and provides links to services that assist queer Muslims. It also hosts “a retreat for LGBTQ Muslims and their partners each May” (MASGD 2017).

**Muscat Confidential**

*Muscat Confidential* is a defunct blog written by a self-described “ex-expatriate who was living in Muscat, Oman, Middle East for too long, but still blogs about the place,” under the alias “Undercover Dragon.” The last entry is dated 27 May 2014. The blog became a site of controversy in Oman in 2010, when Undercover Dragon (even though he described himself as heterosexual) responded to repeated requests for information about LGBT life in Oman by publishing two interviews dealing with the topic: one with a gay “English Gentleman” who was living in Oman (Undercover Dragon 2010b) and one with a bisexual Omani woman who blogged for the (now set private) LGBTQI Omani community blog *Community Queer* (Undercover Dragon 2010c). According to a 6 March 2010 post by blogger “Nadia,” who writes the extant blog *Dhofari Gucci*, the latter interview originally included a picture of two Omani-looking women kissing, which led to *Muscat Confidential* being blocked by the Omani government. This reaction of the Omani government to that interview was particularly interesting in light of the fact that *Community Queer* had just been blocked less than a month prior to the publishing of the interview by *Muscat Confidential*, a fact that *Muscat Confidential* had reported on shortly after it happened (Undercover Dragon 2010a). *Muscat Confidential* was unblocked twelve hours later (Undercover Dragon 2010d).

**Aswat**

Aswat (Arabic for “voices”) is the website for an organization of Palestinian LBTQI women that describes itself as follows:

We are a group of lesbian, bisexual, transgender, intersex, questioning and queer Palestinian women. We came together in 2002 and established a home for Palestinian LBTQI women to allow safe, supportive and empowering spaces to express and address our personal, social and political struggles as a national indigenous minority living inside Israel; as women in a patriarchal society; and
One of the major projects that Aswat has undertaken is called the Information Project. This project is described on the group’s website as having the following aims (among others):

- To combat distortion of information, censorship and ignorance created by social taboos regarding women’s sexuality and lesbianism by disseminating alternative, resisting knowledge.
- To reach-out to other Palestinian gay women struggling with closet, shame, undisclosed feelings and identities and become a main source of information and empowerment by using our direct authentic voice and our own words....
- To increase the presence of women’s sexuality and lesbianism in the Arabic language and culture by forming an alternative glossary and indeed, a “mother tongue” with positive, un-derogatory and affirmative expressions of women and lesbian sexuality and gender.
- To contribute our unique gender and national experiential knowledge to the growing feminist/gay multicultural discourse by encouraging Palestinian gay women to author their “her-stories” and share their experiences, knowledge and perspectives.

To this end, Aswat produced a glossary of LGBTI terms in Arabic (published in 2006) and more than twenty texts on homosexuality and sexual identity, while also publishing essays written by Palestinian lesbian, transgender, and bisexual women about their experiences and their lives. The glossary is a particularly significant contribution to LGBTQI discourse in the Middle East and North Africa region, as it is one of the first times that concepts such as the difference between biological sex and gender identity and Arabic renderings of concepts such as “queer,” “transgender,” and “homophobia” have been tackled in Arabic by the Arab LGBTQI community. The idea of a glossary of Arabic gender and sexual vocabulary was further picked up on and developed by the Lebanese LGBTQI groups Helem and Meem, whose many contributions to the Middle Eastern LGBTQI presence on the internet are discussed in greater detail below, beginning with Barra, a sometimes-online, sometimes-inprint magazine dealing with LGBTQI topics in the Middle East that is published by Helem.

**Barra and Helem**

*Barra* (Lebanese Arabic for “out”) describes itself on its Facebook page as “a bi-quarterly publication by Helem that is oriented to LGBTIQ issues” (*Barra* 2017). Despite this claim, print issues of *Barra* have not been published regularly, and the website address provided on the Facebook page for the magazine (which was last updated in 2014) points to a now-
empty domain. While the magazine is not currently extant, and Helem’s website also has a message saying that it is down, and directing surfers to its hotline, email address, and Twitter and Facebook pages, it is important to note that those Twitter and Facebook pages are very much currently active. Additionally, the Lebanese LGBT Media Monitor, a project run by Helem, is also active on both Twitter and Facebook.

Helem’s Facebook page invites its followers to discussion groups on women’s issues, film screenings, book club meetings, art therapy groups, discussions on sexual diversity, and educational sessions on such topics as hormone therapy and threats posed by the police. The page also posts news articles and essays on LGBTQI history in the Arab world and LGBTQI life in other Arab countries, as well as videos and statements advocating for the improvement of LGBTQI rights in Lebanon and elsewhere (Helem 2017). The Lebanese LGBT Media Monitor project focuses on current events happening in Lebanon and in the Lebanese LGBTQI community, while also serving as a clearinghouse for reporting by media organizations on LGBTQI issues in Lebanon and throughout the Arab world. These same events and announcements are mirrored on Helem’s and the Lebanese LGBT Media Monitor’s Twitter accounts.

Another significant contribution made by Lebanese LGBTQI activists (a small number of whom are associated with Helem) is the creation of what they named the “Gender Dictionary” (Qamus al-jindir). Written by and posted online by people working at Lebanon Support, a nongovernmental organization established with the intent of expanding civil society capacity in Lebanon, the “Gender Dictionary” is similar to the project launched by Aswat but has expanded to include words such as intersectionality, heteronormativity, and cisgender, including, unlike in Aswat’s project, explanations of each of the terms in the dictionary in both English and Arabic in order to provide them with context and to explain the historical and discursive backgrounds of each of the terms (Lebanon Support 2016), reflecting both the extent to which sexual discourse has both changed and developed in the Arab world in a very short period.

*alQaws*

Another website dealing with LGBTQI issues in the Middle East that is still extant is alQaws (“rainbow” in Arabic). On the home page of the website, the group describes itself as:

*a civil society organization founded in grassroots activism ... at the forefront of vibrant Palestinian cultural and social change, building LGBTQ communities and promoting new ideas about the role of gender and sexual diversity in political activism, civil society institutions, media, and everyday life.

*Embracing the diversity of our society, while challenging the political forces*
According to the website, among the resources provided by alQaws are a community center in Ramallah, youth and student groups, intellectual discussion series in both Ramallah and Haifa, and monthly queer community parties. The site also provides information on where these events are happening, articles dealing with issues in the LGBTQI Palestinian community, and a listening and information hotline that LGBTQI Palestinians can call if they have questions or need counseling. alQaws has also launched a singing project called Singing Sexuality, in which LGBTQI Palestinians record songs dealing with their issues, and a safe sex campaign named “I want you safe.”

**IraQueer**

Another important website dealing with LGBTQI issues in the Arab world is that of the organization IraQueer. Available fully in both Arabic and English, the website’s home page states that

*IraQueer is a registered human rights organization focusing on the LGBT+ community in Iraq/Kurdistan region. It was founded on March 2015 making it the first and only LGBT+ focusing on the LGBT+ community in [the] Iraq/Kurdistan region. Having a diverse team of young activists between the age[s] of 18–32 residing mostly inside [the] Iraq/Kurdistan region, IraQueer represents the start of the first queer movement in Iraq’s public history.*

(IRAQUEER 2017A)

Like many of the other sites that deal with LGBTQI issues in the Middle East, IraQueer also has a Facebook and Twitter page. The Twitter page talks about news articles that deal with the LGBTQI situation in Iraq, including executions of LGBTQI people in Iraq by the Islamic State (ISIS). The Facebook page documents the same items as the Twitter page for the most part.
Founded by Amir Ashour, an LGBTQI activist living in Malmö, Sweden, the website provides news related to LGBTQI issues in Iraq, a blog to which LGBTQI Iraqis are invited to contribute, a collection of “journals” in which LGBTQI Iraqis talk about their personal lives and struggles, and a collection of publications, including one titled “Security Guide for LGBT+ Individuals in Iraq/Kurdistan Region,” a pamphlet on sexual health guidelines, and a report to the United Nations on LGBT+ human rights violations in 2015. It is important to note that, as of 2017, both guides were available only in English, but the journals were available in both Arabic and English.

The “Security Guide” focuses primarily on digital security, although it does touch on physical security as well. It advises that Iraqi LGBTQI individuals use a VPN (virtual private network), clear their browser history regularly, password lock their devices, and choose strong passwords that are unique for each site one logs into. It also advises using two-step verification and recommends apps that use encryption, such as Signal, Jitsi, and Telegram (IraQueer 2017b). The “Sexual Health Guide” provides a glossary of sexual terms and talks about safe sex practices, as well as mental health and the sexual rights of Iraqis according to international law (IraQueer 2017c).

Proud Lebanon

Founded by Bertho Makso, Proud Lebanon is an organization and website that deals with the unique issues that Syrian and other refugees in Lebanon face. It describes itself as “a non-profit, non-religious, non-political, nonpartisan civil society that aims to promote sustainable social [and] economic development in Lebanon and the region and is working to achieve protection, empowerment and equality of marginalized groups through community service activities. Proud Lebanon started its activities in August 2013 and is registered since April 2014 as a non-profit civil society” (Proud Lebanon 2017).

The only fully trilingual LGBTQI site discussed in this entry, with articles in Arabic, French, and English, Proud Lebanon’s website deals with issues that LGBTQI refugees face, such as HIV/AIDS, and how Lebanese law applies to and affects refugees in Lebanon. It also features stories from LGBTQI refugees that both are and are not beneficiaries of Proud Lebanon and announces events, including those hosted by Proud Lebanon and events elsewhere in Lebanon that are of interest to the LGBTQI refugee community in Lebanon.

Broader Role of Social Media and Blogs

It is also important to discuss the broader role of social media in the LGBTQI communities in the Middle East. There are numerous social media pages on both Facebook and Twitter that are not affiliated with larger LGBTQI organizations in the Middle East; these span a wide range of themes. Some provide a place for LGBTQI people to meet for dating, others serve a place for people to read news about LGBTQI issues in the Middle East, and others
seem to merely be a place for LGBTQI Middle Easterners to share links on things that they find interesting or funny.

EXCERPT FROM A GAY GIRL IN DAMASCUS BLOG

From 19 February to 6 June 2011, A Gay Girl in Damascus, a blog reportedly written by an “out” lesbian girl in Syria named Amina Abdallah Arraf al-Omari, caused a sensation in the global LGBT community for its daring commentary on politics, gender, sexuality, and Syrian culture. A posting on 6 June, which was supposedly written by Amina’s cousin, reported that Amina had been abducted. The news was covered widely in the mainstream media, with advocacy groups the world over calling for her release. The event prompted others, however, to question Amina’s identity. Within a week, evidence came to light that suggested Amina was not a Syrian lesbian but a married American man, Tom MacMaster, who was living in Edinburgh, Scotland. MacMaster admitted the deception in a posting to Amina’s blog on 12 June.

One of Amina’s most widely republished postings was a 26 April piece titled “My Father the Hero,” in which MacMaster, as Amina, describes a harrowing encounter with two Syrian security agents who arrive at her house late at night to arrest her. She is saved by her father, who manages to shame the two men into leaving through an impassioned speech.

“So you come here to take Amina. Let me tell you something, though. She is not the one you should fear; you should be heaping praises on her and on people like her. They are the ones saying alawi, sunni, arabi, kurdi, duruzi, christian, everyone is the same and will be equal in the new Syria; they are the ones who, if the revolution comes, will be saving your mother and your sisters. They are the ones fighting the Wahhabi most seriously. You idiots are, though, serving them by saying ‘every sunni is salafi, every protester is salafi, every one of them is an enemy’ because when you do that you make it so.

“Your Bashar and your Maher, they will not live forever, they will not rule forever, and you both know that. So, if you want good things for yourselves in the future, you will leave and you will not take Amina with you. You will go back and you will tell the rest of yours that the people like her are the best friends the Alawi could ever have and you will not come for her again.

“And right now, you two will both apologize for waking her and putting her through all this. Do you understand me?”

And time froze when he stopped speaking. Now, they would either smack him down and beat him, rape me, and take us both away ... or....
The first one nodded, then the second one.

“Go back to sleep,” he said. “We are sorry for troubling you.”

And they left!

As soon as the gate shut, I heard clapping; everyone in the house was awake now and had been watching from balconies and doorways and windows all around the courtyard ... and everyone was cheering.... MY DAD had just defeated them! Not with weapons but with words ... and they had left....

I hugged him and kissed him; I literally owe him my life now.

And everyone came down and hugged and kissed, every member of the family, and the servants and everyone. ... We had won ... this time....

My father is a hero; I always knew that ... but now I am sure.

Additionally, there are several privately run and written blogs that deal with Middle Eastern LGBTQI topics, particularly in Lebanon. One of the most notable of these blogs is titled Beirut Boy. Written by an anonymous blogger who goes by a pseudonym eponymous with the blog, the blog deals with LGBTQI news and events in Lebanon, particularly in Beirut, and with the author’s own dating experiences, struggles, and joys. He has been interviewed by Radio France Internationale and engages frequently in his blog with the activities of LGBTQI activist groups in Lebanon, such as Helem.

Another blog that has been important for both the LBTI community and the larger Lebanese feminist community is Sawt Al Niswa (meaning “the voice of women” in Arabic). Describing itself as “a network and a community of feminist writers, activists and artists working towards changing their realities by building a space that critically reflects on the social, political and intellectual experiences of women living in the Arab region—or West Asia and North Africa (however you look at it!)” (Sawt Al Niswa 2017), Sawt Al Niswa has frequently included queer feminist writers and discussed queer issues; the blog also has a podcast on SoundCloud titled Radio Sawt. It has also been frequently referenced by other, more explicitly LGBTQI Middle Eastern groups, such as the now-dissolved (or at least no longer public) Lebanese LBTI group Meem.

Privately written LGBTQI blogs dealing with the Middle East have also been the source of a great deal of controversy and mistrust in the LGBTQI activist community in the Middle East. For example, in 2011, the writer of the Gay Girl in Damascus blog was exposed as actually being an American male graduate student at the University of Edinburgh named Tom
MacMaster (O’Hehir 2015), causing many activists in the Middle East to become more mistrustful of the internet.

**Impact of Queer Internet Sites**

In the second decade of the twenty-first century, there has been a distinct shift from queer websites in the Middle East as a center for activity taking place in cyberspace to queer Middle Eastern websites as the initial public face and point of contact for actual brick-and-mortar organizations. Additionally, the increasing popularity of social media has further changed the nature of queer Middle Eastern websites. Twitter and Facebook often serve as platforms for queer Middle Eastern organizations to send out news and information to the largest number of interested people in the most rapid manner, at times even completely supplanting the standard web page, as in the case of Helem. It is quite possible that the growing prevalence of queer dating websites and apps has also rendered other queer websites and organizations less relevant for the purpose of allowing queer people in the Middle East to find each other and to meet. That being said, queer websites, whether having a presence on social media or not, have provided greater opportunities for LGBTQI activists in the Middle East to find each other and to better connect with both larger internationally focused LGBTQI groups and other smaller LGBTQI activist organizations elsewhere.

Intersex Identities

HILARY MALATINO
Assistant Professor, Department of Women’s, Gender, and Sexuality Studies and Philosophy
Pennsylvania State University

An umbrella term to describe those whose anatomical, chromosomal, and hormonal deviations result in sex-atypical development.

Intersex is an umbrella term that began to be widely utilized by Western medical and sexological practitioners in the mid-twentieth century. It is used to group together a variety of conditions resulting in anatomical, chromosomal, and hormonal deviations from what are considered male-typical and female-typical morphologies. Some of these deviations are apparent at birth, while others develop during puberty. Intersex conditions range from partial or complete androgen insensitivity syndrome, in which people with XY chromosomes (typically considered “male” sex chromosomes) fail to respond to androgens, resulting in female-typical or ambiguous genitalia and sex-atypical morphological development, to congenital adrenal hyperplasia (CAH), a condition wherein people with XX chromosomes (typically considered “female” sex chromosomes) have an adrenal gland that produces larger-than-usual amounts of “virilizing” hormones, resulting in conditions such as clitoromegaly (enlargement of the clitoris), increased facial and body hair growth, voice deepening, and intensified muscle development. CAH also occurs in XY individuals, but in these cases does not manifest in sex-atypical development. While there is significant debate about what conditions fall under the intersex umbrella, scholars of intersex studies and intersex activist organizations tend to include close to twenty conditions that manifest in sex-atypical development, bringing the statistical frequency of such conditions to roughly 1.7 percent of live births (Fausto-Sterling 2000). Public awareness of intersex conditions increased with the publication of Jeffrey Eugenides’s best-selling and widely translated novel Middlesex (2002), a fictional memoir that traces the familial history and experience of an intersex narrator named Cal Stephanides. The Argentine film XXY (2007) also centers the experience of a fictional intersex protagonist as they come of age.

Provincializing Intersex

When discussing the emergence of intersex as a diagnosis and a descriptor of atypical forms of sexed embodiment, it is important to bear in mind that the history of the word intersex is steeped in Western understandings of sex, gender, and embodiment, and emerges out of North American and Western European research on biological sex differentiation. This means that there are significant geographic differences in
nomenclature that are important to bear in mind when considering intersex as an identity category. Additionally, some people with intersex conditions embrace the word *intersex* as an identity descriptor, others are more ambivalent about the use of this term to describe themselves, and some outright reject it. It is imperative that we heed the words of gender theorist David Rubin and “provincialize US [and Western European] debates about intersex” (2015, 74) by bearing in mind that “US and Western understandings of intersex are historically and geopolitically particular, not universal” (52) and that US/Western ways of interpreting intersex bodies and critiquing intersex treatment protocol circulate globally in ways that elide non-Western local and regional histories and contemporary interpretations of nondimorphic sexed embodiment. A counterpoint to the US and Western understandings of biology and sex difference is the set of knowledges that informed late imperial China’s interpretation of biological sex anomalies, wherein an imbalance of yin and yang at the time of conception was understood to cause what in the West would have been understood as “intersex” conditions (Furth 1988).

**Terminological and Diagnostic Debates**

In the West, the term *intersex* came to replace the use of the term *hermaphrodite*—now considered outdated and pejorative in many intersex activist circles—beginning in the early twentieth century. In 1917 German scientist Richard Goldschmidt coined the term in the fourth issue of the journal *Endocrinology*, using it to differentiate a number of conditions that resulted in sex ambiguity that were not specifically hermaphroditic, as the term *hermaphrodite* indexed a being with fully functioning male and female reproductive organs, which is not a phenomenon present among humans. Prior to Goldschmidt’s coining of this term, the dominant diagnostic language used to label intersex conditions consisted of three categories: “true hermaphroditism,” “male pseudo-hermaphroditism,” and “female pseudo-hermaphroditism.” This terminology was elaborated in 1876 by German physician Theodor Albrecht Edwin Klebs, and relied on the histological examination of gonadal tissue in order to determine the “true sex” of intersex subjects. “True hermaphrodites” were subjects whose gonads were a mix of ovarian and testicular tissue; “male pseudo-hermaphrodites” were subjects who had testicular tissue in addition to “feminized” genitalia; and female pseudo-hermaphrodites were those subjects who had ovarian tissue and some apparent “masculinization” of the genitalia (Fausto-Sterling 2000; Dreger 1998).

Historian of science Alice Dreger refers to the period beginning in 1876 and ending in the 1910s as the “age of gonads” (1998, 139), a period when the search for the “true” sex of intersex subjects resulted in the embrace of a moncausal determination of sex—in other words, a method of determining sex where it was understood as “caused” by one discrete biological entity (chromosomes, gonads, hormones), rather than the complex interactions of these phenomena with a broader environment. When confronted with the corporeal sex ambiguities of intersex patients, medical men utilized gonadal tissue to determine sex.
Earlier in the nineteenth century, before the “age of gonads,” multiple and sometimes competing classificatory systems were used to parse, understand, and diagnose intersex conditions. Dreger notes that none of the most widely utilized sex classification systems “divide[d] hermaphrodites along strictly gonadal lines” (140). After the age of gonads, medical practitioners continued to use the three-part classification system developed by Klebs, with the important difference that they ceased relying on gonadal tissue to assign sex, using it to specify conditions, but not to determine the course of “corrective” treatment.

**Medical Sex “Normalization”**

By the middle of the twentieth century, on account of surgical developments that made genital reconstructive surgery possible, as well as the discovery, extraction, synthesis, and mass pharmaceutical production of so-called sex hormones, it became medically possible to intervene in conditions resulting in intersex morphology and “normalize” such sex-atypical bodies. Surgical and hormonal normalization was advocated by sexologist John Money, who cofounded the Johns Hopkins Gender Identity Clinic in the late 1960s and transformed that clinic into a site of experimentation with the “normalization” of intersex infants, children, and adolescents. Money’s recommended treatment method was dictated by his belief that gender identity was largely a matter of social imprinting and could thus be acquired by youths provided that they were socialized into a specific gender at a very young age. He believed that “the sex of assignment and rearing is consistently and conspicuously a more reliable prognosticator of a hermaphrodite’s gender role and orientation than is the chromosomal sex, the gonadal sex, the hormonal sex, the accessory internal reproductive morphology, or the ambiguous morphology of the external genitalia” (Money et al. 1957, 333). However, a key component of successful socialization was genital reconstructive surgery for infants with ambiguous genitalia; Money’s thinking was that if caretakers were attempting to raise a child in female-typical ways but were confronted with such genital atypicality, their ability to consistently relate to the child as female would be compromised. He argued that gender was similar to language acquisition: that it could be taught through immersion, and—like language—was easiest to acquire at a young age. Surgical and hormonal intervention were recommended in order to bring bodies in line with the selected gender of rearing. As gender theorist Jemima Repo explicates, Money’s method of diagnosis and treatment operated by “strategically interfering in the contingent cognitive processes of the behavioral control system of the mind, and by cutting up and reordering ambiguous genitals into normative and normalizing stimuli” (2013, 240).

The treatment paradigm that Money developed at Johns Hopkins, dubbed the optimum gender of rearing (OGR) model by child psychologist Heino Meyer-Bahlburg (Reis 2010), became over the course of the middle and late twentieth century the dominant method of treating intersex infants, children, and adolescents, and resulted in a large number of nonconsensual genital reconstructive surgeries. The surgeries performed were typically
vaginoplasty (surgical construction of a vagina), because it was technically easier than phalloplasty (surgical construction of a phallus), and clitoral reduction or complete cliterodectomy (excision of the clitoris), in order to remove phalloclitoral structures (genital protrusions larger than a typical clitoris but not long enough to be considered as a typical penis) deemed large enough to place genitals within the ambiguous range (which was, according to the practitioners developing this model, somewhere between 1 and 2.5 centimeters in infants). They were performed on infants and small children, who could not adequately consent to such surgical procedures. The criteria for a successful surgical outcome was the ability of the reconstructed genitalia to receive a penis, which demonstrates the heterosexist expectations undergirding such procedures: the end goal being to produce gender-normative, heterosexual women. Many of these surgeries resulted in partial or total lack of genital sensitivity and anorgasmia (difficulty with or inability to achieve orgasm), demonstrating how this model deprioritized the sexual pleasure and agency of intersex subjects.

**Criticisms of Medical Sex “Normalization”**

The OGR model has come under intense criticism from academic feminists and intersex activists, as well as some medical, sexological, and psychiatric clinicians. Intersex studies scholars Dreger and April Herndon, building on the work of feminist sociologist Suzanne Kessler (1998) and feminist biologist Anne Fausto-Sterling (2000), have highlighted the ways it relied on sexist, transphobic, and heterosexist assumptions and violated basic principles of medical ethics, writing that

> it treated children in a sexist, asymmetrical way, valuing aggressiveness and sexual potency for boys and passiveness and reproductive/sexual-receptive potential for girls; it presumed that homosexuality (apparent same-sex relations) and transgenderism (changing or blurring gender identities) constituted bad outcomes; it violated principles of informed consent by failing to tell decision-making parents about the poor evidentiary support for the approach; it violated the axioms of truth telling and “first, do no harm”; it forced children to have their bodies adapted to oppressive social norms, using surgeries and hormone treatments that sometimes resulted in irrevocable harm; it generally involved treating psychosocial issues without the active participation of psychosocial professionals such as psychologists, psychiatrists, and social workers.

*(DREGER AND HERNDON 2009, 204)*
When the first generation of these intersex infants and children came of age in the 1990s, they began to vociferously protest the medical violence done to them in the name of sex normalization. This coincided with the rise of the internet, which increased connectedness and facilitated the sharing of stories and the eventual emergence of intersex activist communities, as well as increased visibility and activity for both gay and lesbian and trans rights movements. Those movements put pressure on institutionalized forms of heterosexism and transphobia in ways that dovetailed with the nascent critique of the OGR model. Early intersex activists organized primarily around ending nonconsensual forms of surgical sex reassignment advocated by the OGR model. The first of these organizations was the Intersex Society of North America (ISNA), founded in 1993 by Bo Laurent (who then went by the name Cheryl Chase) with the mission of ending “shame, secrecy, and unwanted genital surgeries for people born with an anatomy that someone decided is not standard for male or female” (Intersex Society of North America, 1993).

The Intersex Society of North America

The ISNA began as a support group and quickly morphed into an advocacy organization, building a team of intersex adults, parents of intersex children, and empathetically allied medical practitioners, scholars, and lawyers. Representatives from the organization gradually became incorporated within the medical establishment, attending conferences, educating medical students, and drafting papers for publication in medical and bioethics journals arguing for increased medical transparency, an end to nonconsensual medical sex normalization, and increased social acceptance of non-dimorphically sexed bodies. In the middle of the first decade of the twenty-first century they spearheaded the formation of the Consortium on Disorders of Sex Development. In 2006 this consortium published its Handbook for Parents as well as a brochure for medical practitioners, informed by the principles of patient-centered care and titled Clinical Guidelines for the Management of Disorders of Sex Development in Childhood. These documents were consistent with the ISNA’s aims and advocated selecting a gender of rearing for intersex infants and deferring surgical and hormonal treatment until those children were given adequate, nonstigmatizing education on their condition, the risks associated with medical intervention, and the possibilities of living a healthy life in the absence of medical sex normalization. Shortly after releasing this literature, the ISNA disbanded and some former members, including Laurent, formed an organization called the Accord Alliance, which “promotes comprehensive and integrated approaches to care that enhance the health and well-being of people and families affected by DSD” (Accord Alliance, para. 1).

Intersex or “Disorders of Sex Development”? 

It is noteworthy that the Accord Alliance—and the consortium that preceded its formation—does not utilize the word intersex in either its name or mission statement, opting instead
for “disorders of sex development” or “differences of sex development,” both referred to by the initialism DSD. This shift in nomenclature was hotly contested among intersex activists, many of whom claimed “intersex” as an important identity descriptor and objected to applying the language of “disorder” to their nonbinary sexed embodiment, claiming it intensified the feelings of stigma and shame that had only recently come to be countered. The most vociferous and incisive criticisms came from activists affiliated with Organisation Intersex International (OII), a decentralized global network of intersex organizations primarily active in Europe, with affiliate organizations in South Africa, China, Australia, and the Philippines. These critiques were summarized by intersex activist Curtis Hinkle in a 2007 web post wherein he argued that this shift reduced intersex conditions to a genetic “defect,” increased the pathologization of intersex subjects, and relied on Anglocentric diagnostic categories and linguistic norms (because, for instance, in French the word sexual may be used to refer to biological sex as well as sexual orientation and practice, which means that DSD could be mistaken as indexing a “sexual” disorder), and that the consortium promoting this shift did not adequately include intersex subjects in the deliberations that led to the revised clinical and therapeutic guidelines. While the term differences of sex development was coined to sidestep these debates about the pathologization and stigma implied by the word disorder, many intersex activists reject both iterations of the DSD acronym on one or more of the grounds outlined by Hinkle.

Juana la Larga (Long Juana)

The case of Juana Aguilar—dubbed Juana la Larga (Long Juana)—is of particular note when tracing histories of the interpretation sex ambiguities beyond the confines of Europe and North America. Juana la Larga was a purported hermafrodito (hermaphrodite) who was prosecuted in the criminal court of Guatemala City in 1803 for “the crime of double concubinage with men and women” (Few 2007, 159). During the proceedings, physician Narciso Esparragosa was enjoined to examine Juana la Larga, and he concluded that they were not hermaphroditic (both male and female) but rather neither male nor female. Esparragosa’s conclusion debunked medieval and early modern claims of the existence of “hermaphrodites” who supposedly flourished in zones of nascent colonization, and it introduced an understanding of intersex embodiment that differs significantly from the later European discourses of male and female pseudo-hermaphroditism that sought to establish the purported “true sex” of intersex subjects, demonstrating that “by the late eighteenth and early nineteenth century, medical frameworks of sexual difference were not uniform ... nor did medical practitioners in colonial Latin America simply follow European writers on the subject” (Few 2007, 171).

Intersex and Global Human Rights

Rubin’s recommendation to “provincialize” debates about intersex is particularly important
given the burgeoning use of the term *intersex* in the context of global human rights discourses. Since 2012 there has been a proliferation of literature produced by nongovernmental, transnational human rights organizations such as Amnesty International and Human Rights Watch, and several United Nations committees (including the Committee against Torture, the Committee on the Rights of the Child, and the Committee on the Rights of Persons with Disabilities) have spoken out against coercive and nonconsensual medical procedures performed on intersex infants, children, and adolescents. These efforts have resulted in Malta’s 2015 ban on nonconsensual forms of medical intervention that alter the sex characteristics of minors, and a 2016 Chilean Ministry of Health order to suspend all unnecessary normalization treatments for intersex children until they reach an age of consent. Global human rights activism also resulted in the founding of Intersex Awareness Day, observed annually since 2003 on October 26, marking the 1996 protest of the American Academy of Pediatrics by North American intersex activists affiliated with the ISNA and the trans activist organization Transsexual Menace. As these rulings, protests, and declarations regarding intersex medicalization become more common, Western interpretations of sex-ambiguous embodiments gradually elide non-Western local and regional interpretations of the conditions.

**Guevedoces**

Anthropological research on cross-cultural forms of sex variance has documented several local and regional interpretations of nondimorphic embodiment in areas with increased incidences of certain medically identifiable iterations of sex ambiguity. The bulk of this research has focused on population clusters with high incidences of 5-alpha-reductase deficiency, a condition where those that have XY chromosomes and testes do not produce the hormone dihydrotestosterone (DHT), which is largely responsible for the embryonic production of male-typical genitalia and, during and after puberty, for increased hair growth, acne, and hairline recession. This means that individuals with the condition are born with external genitalia that appear either female-typical or ambiguous, but at puberty their bodies effectively masculinize—their voices deepen, their muscle mass increases, they experience a significant growth spurt, and their phallic structure and testes increase in size. Clusters of persons with 5-alpha-reductase deficiency have been identified in Egypt, Papua New Guinea, Turkey, and the Dominican Republic, and in each of these locations different terminologies and epistemologies of sexed embodiment have developed to account for the variations. The best known of these clusters is in the Dominican Republic, where persons referred to as *guevedoces* (roughly translated as “balls at twelve”) were initially socialized as girls and then allowed to transition to a more masculine gender identity at puberty (Lang and Kuhnle 2008). The high rate of reportage on guevedoces in the West is largely due to the role they have played in pharmaceutical research and development. In the 1970s Julianne Imperato-McGinley, a medical doctor based at Cornell University, traveled to the Dominican Republic to study this cluster and bring several
guevedoces back the United States for research. Following Imperato-McGinley’s realization that a lack of DHT had inhibited the growth of the prostate glands of guevedoces, “pharmaceutical giants Merck and GlaxoSmithKline started developing the 5 Alpha Reductase inhibitors finasteride and dutasteride respectively” (Gurram and Ashley 2016, 526) to treat male-pattern baldness and enlarged prostates.

**Sex Testing and Legal Sex/Gender Designations**

The prevalence of binary (male/female) markers on legal identification documents has historically necessitated that intersex people select a binary sex assignation. However, in response to trans and intersex activism on the issue, some nations and states have made it possible to legally change one’s gender identification assigned at birth, and enabled voluntary legal identification in a nonbinary category. In 2003 it became possible to choose an “X” sex designation in Australia and New Zealand, and several other nations have followed this example. Certain US states have adopted an opt-in nonbinary classification for intersex people only. In 2017 New York City issued the first birth certificate with an “intersex” gender designation.

Mandatory sex testing in sport was imposed by the International Association of Athletics Federations (IAAF) in 1950 and first utilized in the Olympics in 1968, and it continues in the early twenty-first century. Initially developed to prevent men from competing in women’s sports, sex testing began as a physical exam, later moved to chromosomal testing, and currently relies on monitoring testosterone levels of female athletes. As a result, many women with intersex conditions have been prevented from competing, subjected to sex normalizing procedures, and forced to take measures to lower the amount of naturally occurring testosterone in their blood.

Involuntary Servitude and Same-Sex Sexuality in Africa

KUUKUWA ANDAM  
PhD candidate  
Queen’s University, Canada

MARC EPPRECHT  
Professor, Department of Global Development Studies  
Queen’s University, Canada

Examples of same-sex sexual practices in involuntary servitude in African history.

Slavery, pawnship, concubinage, and other forms of involuntary servitude were historically common throughout much of Africa. In some societies, unfree laborers constituted the majority of the population (Lovejoy 2011). Even slaves could own slaves, who performed a wide range of tasks that included providing sex. A lingering association between same-sex sexuality and slavery in the popular imagination today complicates initiatives to win rights and dignities for sexual minorities.

Slaves were generated through raids and kidnapping, by voluntary sale of children or other dependents, and by removing accused witches and criminals from free society. People suspected of witchcraft may have included individuals whose sexual behavior could not be explained or accommodated within the heteronormative tent (including homosexuals, as Ikpe 2009 claims). The internal market for slaves was probably the largest in absolute numbers. An export market oriented to the Islamic world (trans-Sahara, trans–Red Sea, and trans–Indian Ocean) also increasingly became internal to Africa as powerful Islamic states consolidated across the Sahel in the eighteenth and nineteenth centuries. From the sixteenth through the nineteenth centuries there was an export market to the Atlantic Ocean islands, then to the Americas, to the Cape of Good Hope, and to plantation economies in the Indian Ocean. The suppression of these slave trades and of slavery itself over the course of the nineteenth and twentieth centuries was commonly cited at the time to justify the extension of European colonialism, although barely disguised forms of slavery, such as indentured labor, survived through the colonial period and indeed, persist into the present day.

The transatlantic slave trade has tended to attract the greatest attention on account of its scale, brutality, and role in stimulating the Industrial Revolution in Western Europe and North America. From the perspective of the history of same-sex sexualities, however, this
trade was significant mainly for occasionally making traditional same-sex practices visible to European observers, and transplanting these from Africa to the Americas. Europeans were seeking slaves primarily for agricultural production for the capitalist market (sugar, tobacco, cotton, and so forth). Exports from Africa of males outnumbered females by roughly two to one, and it was during the process of capturing and transporting them that cases of male-male sexuality were revealed (Sweet 1996; Murray and Roscoe 1998). During this period, anal penetration by or of cult priests was observed as a form of initiation to the cult that represented a transfer of knowledge and power among the Yoruba and Ovimbundu peoples. This practice reputedly survived the transatlantic journey to become entrenched in slave culture in the Americas, expressed, for example, in the adé (“passive homosexual”) priests of candomblé in northeastern Brazil (Matory 2005). By contrast, sexuality was a core feature of the internal and Islamic slave trades, which were predominantly of females. Women were valued for their subsistence agricultural and domestic labor, and for sex. For many female slaves, that low status was a phase on the way to attaining freedom through giving birth and joining a polygynous marriage as a junior wife (Robertson and Klein 1983).

**Muslim Societies**

Male slaves were used for production and porterage, but also for military and administrative purposes. Indeed, they could rise to positions of considerable authority in state bureaucracies. There was also a trade in eunuchs, who were valued in the Muslim world for their loyalty to their masters (rather than to their own families or dynastic ambition), for their discretion with the masters’ female wives, and for their use as sexual objects in their own right. A significant export market was to supply the slaves who ruled Egypt for several hundred years, the Mamluks.

The Mamluks were men imported into Egypt as soldiers, mainly from Central Asia, the Caucasus region, and the Balkans. A Turkish Mamluk effectively ruled in Egypt from as early as 868 CE, although in the later years of that dynasty black Mamluks played a key role in government. They were defeated in 905 by invading Arab armies, but the system was retained. Mamluks lived together in barracks in the encampment that became Cairo, conducted endless military training, and fought fiercely to defend the Islamic world from its many enemies. While they could marry women, neither their wives nor children could inherit any wealth and property. Their ranks as a class were refilled not by producing their own children but by purchasing and attracting recruits, whom they trained in the martial arts and masculine honor. The Mamluks were also notorious for being “addicted to homosexuality” (Murray and Roscoe 1997, 161), primarily with eunuchs imported from elsewhere in Africa rather than with each other.

Islam was sometimes amenable to such relationships, in part because of the way it recognizes (and regulates) slavery, and by how it categorizes sinful behavior. Heterosexual
intercourse outside of legal marriage or concubinage (zina) was the preeminent sexual “enormity.” The penalty for zina was death, and it is easy to see how this arose in relation to the culture of family honor, and particularly masculine honor in the Arab and Berber worlds. The need to protect the virginity of daughters, the modesty of wives, and hence the good reputation of the family over which the husband presided, was paramount. Temptations to commit zina therefore had to be reduced by practices that kept apart boys and girls and men and women in all but the most controlled, carefully watched settings. Strictly enforced segregation by sex meant people spent long periods without any prospects of heterosexual relations. By many accounts, this gave rise to same-sex relations as the lesser of two evils. Indeed, the social rank of the person being penetrated and his or her legal relationship to the penetrator, rather than the act of penetration itself, is what determined the level of moral infraction. Many of the scholars who interpreted Islamic jurisprudence over the centuries thus found same-sex relations between social equals reprehensible, but tacitly condoned the use of slaves however one wished (Gadelrab 2016).

**West Africa**

The jihads that established caliphates and other reformist Islamic states across West Africa imported ideas and institutions from the Middle East, including the use of Mamluks (Stilwell 2004). No study has yet revealed whether such slaves among the Hausa behaved sexually as did their like in Egypt. However, an institution arose in Hausa society, and among the Wolof to the west, that legitimized effeminate men as providers of sex for “normal” men. The ‘yan daudu (singular: ‘dan daudu) were not necessarily in involuntary servitude, but they engaged in sex work, derived their income therefrom, and as such were stigmatized as not far from slaves. ‘Yan daudu performed traditionally feminine roles including cooking, singing, dancing, and using certain gestures and language that they described as wasa (play) to describe the pleasure they derived from these activities (Gaudio 2009). The ‘yan daudu used their feminine mannerisms to attract potential patrons. Among the Wolof, a similar role was performed by gor-digen (men-women), who also wore feminine attire and hairstyles.

‘Yan daudu were sometimes linked to bori, a cult of spirit possession thought to be rooted in the pre-Islamic past. Bori and zar, a similar phenomenon, was known in Sudan and east Africa, honored saints almost in the manner of ancestral worship, and was often frowned upon if not directly suppressed by Islamic purists. Bori allowed the poorest and most oppressed to vent their emotions in a cathartic way, and for that reason was popular among women, slaves, and men who “did the deed” (i.e., had sex with men; Gaudio 2009). Shrines were, meanwhile, typically managed by a woman in whose body a venerated male spirit came to reside. As a male spirit incarnate, she could not have sexual relations with men, but rather took female adepts or servants with whom, it was sometimes whispered, she did have sex. One Islamic scholar from the eastern Senegal region left a damning
account of this on his way home from the hajj to Mecca in 1809. It is worth quoting at length one of the very rare instances of a black African writing on this topic:

Do you not see that they take unaccountable sums of money at the hands of [black] women for the worship of the jinn and for lesbian conduct? Muslim women have begun to steal money from their husbands to pay for the worship of idols and [the practice of] lesbianism. Do you not see that women have exchanged their men folk for slave women? Do you not see that whoever embraces a slave woman, if she is beautiful or wealthy, no one can marry her and she can be married only to none but the bori?

(QUOTED IN MONTANA 2004, 190–191)

Non-Muslim societies also made use of eunuchs for ritual purposes. In Dahomey (a kingdom situated in the geographical area currently occupied by the Republic of Benin) during the nineteenth century, eunuchs were among at least three groups of individuals, pledged in service to the king, who exhibited some degree of gender and sexual diversity. Men were turned into eunuchs through an operation described as involving the pulling apart of the testicles and said to be fatal if deferred into adulthood. The eunuchs were allotted the title of the “king’s wife.” There was a head eunuch who supervised other eunuchs and attended to the king personally. Excluding royalty, the head eunuch was the fourth-most powerful person in the realm and served as a minister of the palace interior. Some eunuchs were said to look almost identical to women in their physical appearance. Eunuchs, along with several of the king’s female wives, were executed when their king died (Burton 1864).

The lagredis were also high-ranking male officials in the king’s council who performed a variety of functions, including accompanying the king’s emissaries, monitoring royal negotiations, and providing feedback to the king. Lagredis were feminine in nature and appearance and were selected to serve in their roles at a young age (Murray and Roscoe 1998). In the nineteenth century the Ashanti and Denkyira (kingdoms situated in the geographical area currently occupied by the Ashanti and Central Regions of the Republic of Ghana) also had customs that provided an environment for homoerotic relations to develop. This tradition was known as the ɔkra or crabbah (soul) custom, whereby royalty chose slaves of the same sex to treat specially, bestow with gifts, and have an intimate relationship with (Ellis 1883; Hutchinson [1861] 1967). They were reputedly killed at their master’s or mistress’s funeral to accompany him/her to the afterlife. Donald L. Donham (1990) describes yet another ritual use of male-male sex through the ashtime role in Maale society of southern Ethiopia. Ashtime (which Donham translates as “male transvestites,”
but it would probably be more accurate to say “transgendered”) performed domestic labor and ritual functions in the king's court. The king, as “the male principle incarnate,” had to be shielded from pollution by female sexuality at key moments in the ritual life of the nation. Men who approached him after having had sex with their wives endangered his purity as a symbolic figure; hence, they should either abstain altogether, or have sex with an ashtime in order to protect the health of the nation.

**Warriors and Boy-Wives**

In the early twentieth century a practice was observed among the Zandes (variation: Azandes, an ethnic group currently found in South Sudan, Democratic Republic of the Congo, and Central African Republic) where bachelor warriors married and had sexual relations with boys. The boys were typically adolescents and young adults, and while not technically slaves or even servants, they were obliged in a patriarchal, gerontocratic society to obey their elders' commands. These marriages were akin to heterosexual marriages in those communities. Bride-price was paid, and the boy was lavished with gifts. The warrior addressed the boy's parents as his in-laws and performed services for them as men did for the parents of their brides. Additionally, the boy performed some traditional duties of a wife, including fetching water and collecting firewood. Boy-wives bore their warriors' shields during journeys, and the couple slept together on the same bed and engaged in intercrural sexual intercourse (nonpenetrative sexual intercourse between the thighs). Any man who had intercourse with another warrior's boy-wife could be sued for adultery and was liable to compensate the offended spouse (Evans-Pritchard 1970).

These practices, like large-scale polygyny, largely disappeared under the influence of Christian ideology and the emerging colonial political economy. Yet, similar arrangements arose in response to the skewed demography of racial capitalism. Best attested in southern Africa, but also found among long-distance porters elsewhere on the continent, boy-wives accompanied men as servants and sexual companions on the long journeys to and from work in such industrial centers as Johannesburg (Harries 1994). Young, unaccompanied arrivals at the mines were recruited by older men into the same servile relationship patterned on a normal heterosexual marriage. The “wife” in these cases would eventually mature out of that role to become a husband in his own right. In some cases, there was a metaphysical aspect to the relationship—to protect the senior partner against the dangers of work, or to achieve a promotion and wage hike through the ritual transgression of sexual norms (Niehaus 2002).

African history is filled with persons who exhibited sexual and gender diversity. Some of these individuals were either in positions of enforced labor, or bound to service to their same-sex partners. Indeed, Stephen Murray and Will Roscoe (1998) note that in discussing the history of homosexual relationships across the continent, one must bear in mind that it is only in relatively modern times that there have been expectations for romantic
relationships to be mutual and egalitarian. The long history of slavery, servitude, and same-sex relations makes it difficult for many Africans to imagine same-sex sexuality as potentially loving, equal, and deserving of human rights protections.

ISIS Gay Trials

HANADI AL-SAMMAN
Associate Professor of Arabic Language and Literature University of Virginia, Charlottesville

The atrocities committed against gay men by those affiliated with the jihadist group known as the Islamic State of Iraq and Syria.

After its emergence in 2011, the jihadist group Islamic State of Iraq and Syria (ISIS) swiftly took a large amount of territory in Iraq and Syria, taking advantage of the Sunni/Shi’i power imbalance created by the US invasion in the former and the civil war in the latter. The group’s fundamentalist interpretation of Islam resulted in various atrocities committed against both people and property. These transgressions included subjecting the people in the areas that ISIS controlled—such as Mosul and Fallujah in Iraq and Raqqa and other cities in Syria—to strict Islamic interpretations in matters of clothing and worship. ISIS also destroyed world heritage sites, such as the ancient city of Palmyra in Syria, on charges that they promoted idolatry. In addition, ISIS soldiers enslaved Yazidi women in sexual servitude and executed suspected members of the LGBT community in what is dubbed the ISIS gay trials.

Though an exact number of those persecuted by ISIS on charges of liwat (sodomy) is neither available nor verifiable, the New York–based OutRight Action International estimates that thirty-six men had been executed as of 2015 (Associated Press 2015). The executions took place in various cities under ISIS control, including Mosul, Raqqa, Palmyra, and others in the Syrian northern region. Reports come from individuals who have escaped areas controlled by ISIS and are awaiting resettlement in the West, in Lebanon, or Turkey. One such account, told by Omar (not his real name), is of two men, Hawas Mallah (age thirty-two) and Mohammad Salamah (age twenty-one), who were executed in Palmyra in December 2015. The two were found guilty of sodomy by an ISIS judge, who ordered them to be thrown off the roof of the nearby Wael Hotel to cleanse their sins and to deter others who might engage in same-sex sexual practices. Asked whether they were satisfied with the judgment, Mallah stated that he preferred a bullet to the head instead, while Salamah begged for a chance to repent. Nevertheless, ISIS militants proceeded to execute the judge’s verdict, announcing that two of “Lot’s people” would be punished on that day in Palmyra’s main square. Subsequently, a black van carried Mallah and Salamah to the execution site, where they were both hurled to the ground from the top of the Wael Hotel; Salamah landed on his head and died instantly, but Mallah, who was tied to a chair, did not, so an ISIS fighter shot him in the head. The bodies were then hung up for two days in Palmyra’s
Freedom Square, each with a placard on his chest that read, “He received the punishment for practicing the crime of Lot People” (Associated Press 2015).

These executions took place after ISIS issued its own penal code on 15 December 2014, titled “Clarification [regarding] the Hudud [Qur’anic punishments].” The document details the punishments—according to shari’a—for various illegal acts, including gay sex: “Death for the person committing the act, as well as for the one receiving it.” ISIS declared that it distributed the penal code as a reminder to people living in the “caliphate” and warned that it would be vigilantly enforced (Counter Extremism Project 2018). The friends and family of those convicted of sodomy may also find themselves in grave danger because ISIS can access the phone contacts and Facebook accounts of suspected homosexuals to entrap others; ISIS informants masquerade as potential dates, thereby catching people redhanded. Those who had escaped to neighboring Turkey or Lebanon admitted to being afraid that their own families would turn them in to ISIS. As refugees, they remain easy targets for persecution by their local and host communities. For that reason, human rights groups describe Syrian and Iraqi gay refugees as “double refugees.”

**Islamic Rulings on Liwat Punishment**

Whether ISIS’s gay persecution is the correct Islamic punishment for those who engage in same-sex sexual acts is a matter of dispute. Like Judaism and Christianity, Islam frowns on same-sex sexual practices. The main admonition comes from the story of Lot and his warning to his people never to commit the sin of desiring men and preferring them over women. The seventh sura (chapter or section) of the Qur’an, known as Surat al-ʿAraf, describes same-sex sexual behavior as al-fahisha (sin) in the following manner: “And Lut said to his people: ‘Do ye commit lewdness such as no people in creation [ever] committed before you? For ye practice your lusts on men in preference to women: ye are indeed a people transgressing beyond bounds’” (7:80–81). Surat Hud continues the story and details the reason for the punishment of Lot’s people. When God’s messengers visited Lot’s house, the people of Sodom barged in, wanting to rape them. Lot offered his daughters for them to marry instead, but they refused, telling him, “Well dost thou know we have no need of thy daughters: indeed thou knowest quite well what we want!” (11:79). It was at that moment that God ordered the destruction of Sodom, turning it upside down and showering it with brimstones: “When Our decree issued, we turned (the cities) upside down, and rained down on them brimstones hard as baked clay, spread layer on layer” (11:82).

In these suras, the Qur’an never mentions individual punishments for persons engaging in same-sex sexual activity but rather a collective punishment of the entire city of Sodom and its inhabitants, with the exception of Lot’s own family (excluding his unrighteous wife). ISIS’s punishment ritual of throwing suspected homosexuals from rooftops and then stoning them comes from its own interpretation of the latter Qur’anic sura (Hud 11:82); by analogy, they equate the heavenly shower of brimstones to throwing convicted men from
buildings. Additionally, several hadiths (the sayings of the prophet Muhammad) have been interpreted as ordaining killing as a punishment of Lot's people, although they do not specify the method of killing. For example, ʿAbdullah bin ʿAbbas cites the following weak (in the sense of not following the proper chain of references) hadith, “If you find anyone doing Lot’s people’s actions, kill both the active and the passive partners” (quoted in Jawziyyah 1996, 334). In the same vein, religious scholars have debated whether liwat is similar to zina (adultery) in nature and in punishment. The caliphs Abu Bakr (573–634) and ʿAli ibn Talib (600–661) found that “liwat’s punishment should be harsher than that of zina, which should be killing at any rate, whether the convicted is single or married” (quoted in Jawziyyah 1996, 331). Others, including al-Shafiʿi (c. 767–820) and Imam Ahmad bin Hanbal (780–855), concluded that the punishment for liwat should be equal to that of zina (usually stoning for married people and flogging for single persons). A third group, including al-Hakim (996–1021) and Abu Hanifa (699–767), argues that “liwat’s punishment should be lesser than zina, and should only be restricted to taʿzir [prevention or corrective measures]” (quoted in Jawziyyah 1996, 331).

Contemporary punishments for sodomy in most Middle Eastern countries vary a great deal, ranging from imprisonment in most Arab countries to death by stoning in Saudi Arabia, Yemen, and Mauritania, and by hanging in Iran (Bearak and Cameron 2016).

The LGBT Brigade

Amid the outbreak of ISIS persecutions of suspected homosexual men, reports surfaced about the creation of an LGBT military unit fighting alongside Kurdish forces in northern Syria to exact revenge on ISIS. As with all information on ISIS and LGBT intersections, it is hard to independently verify the identities of brigade members, their financiers, and even whether they are a real entity or just a hoax. On 25 July 2017 Benjamin Kentish of the Independent (London) reported that a group of international volunteers fighting ISIS had formed a military unit named The Queer Insurrection and Liberation Army (TQILA; pronounced “tequila”), operating under the umbrella of the International Revolutionary People’s Guerrilla Forces (IRPGF), an anarchist group taking part in the fight against ISIS. TQILA’s formation was announced in a statement posted on its Twitter page that read: “We, the International Revolutionary People’s Guerrilla Forces (IRPGF) formally announce the formation of The Queer Insurrection and Liberation Army (TQILA), a subgroup of the IRPGF comprised of LGBTQI+ comrades as well as others who seek to smash the gender binary and advance the women’s revolution as well as the broader gender and sexual revolution” (Kentish 2017). Though TQILA asserts that “the images of gay men being thrown off roofs and stoned to death by Daesh [ISIS] was something [that they] could not idly watch,” it appears that their main audience was the international groups they addressed on Twitter and Facebook. The photos they posted on social media showed masked soldiers in military uniforms holding guns and standing in front of a banner
reading: “These Faggots Kill Fascists, TQILA-IRPGF.” Once again, there is no way of authenticating the photo to determine whether it was real or staged.

The paraphernalia of a rainbow flag and a banner displaying the group’s logo—an AK-47 on a pink background—held aloft by unidentified soldiers in what is purportedly Raqqa, seem to conform to what Joseph Massad (2007) calls a “Gay International” movement’s agenda and discourse rather than a local cause and concern. Supplanting the local terms luti (a person who engages in liwat) and ISIS with the Western discourse of “faggots” and “fascists” undermines the credibility of the group, framing it as an import of the LGBT international agenda rather than a local response. To complicate matters more, three days after the Twitter announcement of the TQILA formation, the Kurdish militia unit (of the Yekineyen Parastina Gel [YPG], or People’s Protection Units) that TQILA was supposed to fight alongside denied the group’s existence and the authenticity of the photo. Mustafa Bali, a spokesperson for the Kurdish-Arab coalition known as the Syrian Democratic Forces (SDF), of which the YPG is a major player, posted on his Facebook page the following statement, which was later aired on the Kurdish news site ARA News: “We in the Syrian Democratic Forces (SDF), while emphasizing our deep respect for human rights, including the rights of homosexuals, we deny the formation of such a battalion within the framework of our forces and we consider this news to be untrue” (Moore 2017).

**ISIS-Inspired Killings in the Diaspora**

The threat for LGBT individuals does not end with their escape from ISIS. Many LGBT refugees in the diaspora report fearing violence from ISIS-affiliated persons or homophobic, conservative populations in their host countries. On 25 July 2016 the decapitated and mutilated body of Muhammad Wisam Sankari, a Syrian refugee, was found in Yenikapi, a central district in Istanbul. Five months before he was killed, Sankari was targeted by a group of men who gang-raped him in a nearby forest; in addition, he and some of his roommates had been harassed by phone and text messages threatening to kill them. Sankari reported these incidents to the Turkish authorities, who did not take them seriously. A Turkish LGBT group, Kaos GL, reported that Sankari was trying to be relocated to another country through the United Nations Refugee Agency because his life was in danger (BBC News 2016). Two days before his body was discovered, Sankari left his home in the conservative Fatih district and then went missing. One of his friends described the condition of his body: "They cut Wisam violently. It was so violent; two knives had broken inside of him. They beheaded him. His upper body was beyond recognition; his internal organs were out. We recognised our friend from his trousers" (Agence France-Presse 2016). Though sodomy has been legal in Turkey since 1923, conservative attitudes and political upheaval and threats by ultranationalist groups have led to the banning of the annual gay pride march since 2015.

It is not only refugees who face threats from ISIS. An ISIS-inspired attack on the gay
nightclub Pulse in Orlando, Florida, on 12 June 2016 resulted in the deaths of forty-nine people, with fifty-three more injured. Before the attack, the shooter, a US citizen of Afghan origin named Omar Mateen, made a 911 call in which he reportedly pledged allegiance to ISIS leader Abu Bakr al-Baghdadi. Following a shootout with police in which Mateen was killed, ISIS officially claimed responsibility for the attack, announcing that “an Islamic State fighter” had “targeted a nightclub for homosexuals” (Tsukayama et al. 2016). Despite Mateen’s claims and ISIS’s assumption of responsibility for the attack, Mateen was not a religious person, and an FBI investigation into his background showed that he was not affiliated with ISIS and did not have any help in planning the attack. Other reports alleged that he was a psychologically troubled person with doubts about his own sexual identity. An examination of his cell phone indicated that he frequented gay dating apps before the attack; it is unclear whether Mateen was employing a tactic often used by ISIS to ensnare LGBT individuals, or he was a closeted gay person whose guilt motivated him to attack the Pulse club as a form of religious atonement for his “sin” of homosexuality. Mateen’s father adamantly denied that his son was homosexual, stating, “Let me tell you: my son is not gay. He’s not.” Mateen’s ex-wife, Sitora Yusufiy, is not so sure. “It's just making more sense in my head from my personal experience that this was probably it,” she said. “He might have been homosexual himself and lived that lifestyle but could never ever come clean about it because of the standards of his father, because of the obligation to be a perfect son” (Alter 2016).

The difficulty of finding credible reporting, the lack of a uniform Islamic verdict on the punishment for sodomy, and the intersections of local and global LGBT international networks with reference to ISIS gay trials and hate crimes make documenting and evaluating these incidents challenging, and raise suspicions of their entanglement with global pinkwashing practices. These methods use LGBT human rights issues to justify targeting, bombing, and colonizing Middle Eastern lands such as Iraq and Syria. Unfortunately, the shadow cast by pinkwashing tactics obscures the visibility of the oppression of Middle Eastern LGBT populations due to entrenched homophobic beliefs and praxes.

Iskandariyya … Leh? (1979; Youssef Chahine)

MICHAEL ALLAN
Associate Professor and Petrone Faculty Scholar, Department of Comparative Literature
University of Oregon

Egyptian movie that includes a subplot of a same-sex encounter between an Egyptian and a British soldier.

*Iskandariyya … leh?* (Alexandria … why?) is the first of a series of autobiographical films directed by the Egyptian filmmaker Youssef Chahine (1926–2008). It was critically acclaimed in Egypt and internationally and was awarded the Silver Bear Special Jury Prize at the 29th Berlin International Film Festival in 1979. Among a number of stories woven together, the film includes a subplot of a same-sex encounter between an aristocratic Egyptian and a young British soldier.

**Plot Summary**

Set against the backdrop of World War II (1939–1945), the film focuses on the coming-of-age of Yehia (played by Mohsen Mohiedine), a student at the prestigious Victoria College in Alexandria, Egypt, who dreams of traveling to Hollywood. Much of the story follows Yehia as he develops his love of acting and struggles to find the resources to study at the Pasadena Playhouse in California. He is shown eschewing the pursuit of women for his love of cinema, and the film tracks his development as an aspiring actor from his recitation of scenes from *Hamlet* to his involvement in the drama club at his school. As the film progresses, Yehia struggles to persuade his father to support him in his Hollywood dreams. After a short time working in a bank, Yehia finally gains admission to the Pasadena Playhouse and secures the support of his family, including his father and grandmother, both of whom are instrumental in helping him procure the visa and financing to undertake the voyage to the United States.
Among a number of stories woven together in this critically acclaimed movie by Egyptian filmmaker Youssef Chahine is a subplot of a same-sex encounter between an aristocratic Egyptian and a young British soldier.

In addition to Yehia's story, the film offers a broader portrait of wartime Alexandria, with attention to groups often written out of accounts framed in ethnic, linguistic, or religious terms. The film both opens and closes with scenes at the coast: the initial scene is of children playing in the water, intercut with images of Nazi wartime air strikes, and the ending scene is of Yehia's departure aboard a ship destined for the United States. What emerges is a vision of Alexandria that points to the city's rich history and complex social composition. Among the various stories told, the film includes a nationalist group plotting to assassinate British prime minister Winston Churchill as part of a plan to liberate Egypt from British rule. It also includes stories about the working classes and connections to the Communist Party, and it gestures at various points to the Christian, Muslim, and Jewish communities intersecting in Alexandria. Newsreel footage interspersed throughout various scenes keeps alive the interplay between the film's narrative and the historical backdrop against which it all transpires.

Most prominent among the various subplots in the film are two distinct love stories, both of which highlight the challenges of taboo relationships. There is the story of an affair between Sarah (played by Naglaa Fathi), the daughter of a wealthy Jewish aristocrat, and Ibrahim (played by Ahmed Zaki), a college student and member of the communist
resistance who is eventually arrested and sentenced to fifteen years’ hard labor. At a crucial moment, anticipating the Nazi invasion of Egypt, Sarah reveals that she is pregnant with Ibrahim’s son just as she and her father are forced to depart Egypt for South Africa and, eventually, Palestine. Later in the film and following the war, Sarah returns to introduce the imprisoned Ibrahim to their son, whom he greets through the bars of the prison. As they speak, Sarah bemoans that Judaism has shifted from being a religion to being a nationality, and she remarks on the challenging conditions of living in Haifa, far from her true homeland in Alexandria.

The other key subplot is the story of a nationalist aristocrat, Adel (played by Ahmed Mehrez), and a working-class British soldier, Tommy (played by Gerry Sundquist). As the film begins, Adel arranges to purchase a kidnapped soldier, ideally one from New Zealand, to be murdered as part of the struggle against British occupation. When drunken Tommy is eventually delivered, Adel brings him to the seaside, leans him across the rail, points his pistol toward Tommy’s slouched body, but ultimately finds himself unable to pull the trigger. In the next scene, Tommy awakens in his underwear in Adel’s bed, seemingly unaware of how he got there. Intrigued by the young soldier, Adel looks upon him fondly, offering him breakfast and then introducing him as his friend when someone enters the room. In subsequent scenes, Adel is shown reading a letter from Tommy, who reports on the battle of El Alamein (al-ʿAlamayn) and complains of the hardship of war and the hierarchy between the generals and the soldiers. Upon the announcement of British victory, Adel discovers that Tommy has, in fact, been killed, perhaps even shortly after composing the letter from the front. A scene of Adel weeping at Tommy’s grave site gives way to a montage of headstones of British, Egyptian, and German soldiers killed in Alexandria, as Vera Lynn’s “The White Cliffs of Dover” plays on the soundtrack.

In the end, the romantic connections between Sarah and Ibrahim, on the one hand, and Adel and Tommy, on the other, are both thwarted by social conditions. And in a film that otherwise tracks the hopes and aspirations of Yehia in pursuit of his dreams, both of these romantic subplots end in tragedy.

SOURCE: MISR INTERNATIONAL FILMS

Scene from the Movie Iskandariyya ... Leh? (1979). In this scene, the British soldier Tommy wakes up in bed to find he is being held at gunpoint by Adel. Although Adel had intended to kill Tommy to advance the
cause against British occupation of Egypt, the two men develop a forbidden relationship.

Iskandariyya ... leh? in the Context of Chahine's Work

As the first film in his autobiographical series, Iskandariyya ... leh? presents Chahine’s early life through the character of Yehia and highlights his connections to Alexandria, filmmaking, and the history of Egypt. This first film concludes with Yehia’s departure to begin his studies at the Pasadena Playhouse. The second, Hadduta masriyya (1982; An Egyptian story), deals with Chahine in his thirties and forties as he aims to establish his career as a filmmaker and struggles with his health. Much of the film transpires in the form of a surreal courtroom drama with staged flashbacks as he undergoes heart surgery in London. As was the case in Iskandariyya ... leh?, Chahine incorporates archival footage, and he also includes a scene with homoerotic glances between himself and his London taxi driver, leaving rather unambiguous the desire between the two men. The third film, Iskandariyya kaman wa kaman (1989; Alexandria, again and forever), considers the director’s then-present moment and depicts the decision of a favorite actor, ‘Amr, to leave to pursue films financed by oil money. The film is seen as a reflection on Mohiedine’s break with Chahine but connects this incident to social questions regarding the Egyptian film industry, contemporary Egypt, and the star system. Together, these three films help to secure Chahine’s status as a global auteur, even if they never met with the popular success of his earlier film Bab el hadid (1958; Cairo station).

There are few directors who share Chahine’s iconic status among Egyptian and Arab filmmakers. In 1997 he was awarded the 50th Anniversary Prize for lifetime achievement at the Cannes Film Festival, and he is well known for helping to launch a number of acting careers, including those of Omar Sharif and Mohamed Henedi. Chahine’s filmography is remarkable for spanning a range of genres and styles, at times even within a single film. He is perhaps most famous for his 1958 film Bab el hadid in which he himself performed the lead role of Qinawi, a worker in the rail yard who falls in love with Hanuma (played by Hind Rostom). His 1969 film Al-ard (The land), an official entry at the 1970 Cannes Film Festival, is based on the novel by Abdel Rahman al-Sharqawi and revolves around a conflict between a rural landlord and peasants in the 1930s. Chahine is also widely respected for his historical epics, including Al-Nasir Salah al-Din (1963; Saladin the Victorious), which presents the twelfth-century Muslim leader Saladin as a sort of hero of Pan-Arabism, as well as Al-masir (1997; Destiny), which recounts the story of the twelfth-century Muslim philosopher Ibn Rushd (Averroës) in the context of an authoritarian government and religious opposition to his work. Never one to shy away from political engagement, Chahine also directed a number of documentaries and films that blurred the boundaries between historical fiction and documentary, including a film dealing with social life in contemporary Cairo and earlier work addressing the formation of the Aswan Dam.

Queerness in Chahine’s Films
Of the many social, cultural, and political issues that Chahine broached in his work, same-sex desire and queerness draw attention, either implicitly or explicitly, in many of his films. In various instances, Chahine’s films present same-sex romance between a foreign man and an Egyptian, and at other times, he highlights homoeroticism in a more general sense, reversing or playing with codes of objectification, spectacle, and looking relations.

In the first of these instances, same-sex relationships seem most pronounced at moments of imperial interaction, as though to suggest that homosexuality is a sort of foreign importation. Chahine’s *Al-nas wa al-Nil* (1972; The Nile and its people), for example, includes a love story between Barak, a Nubian working on the Aswan Dam, and Nicolai, a Soviet engineer assigned to the project. The second film of the series,*Hadduta masriyya*, includes a scene highlighting the director’s flirtation with a taxi driver in London, and a later documentary commissioned by French television,*Le Caire, raconté par Youssef Chahine* (1991; Cairo, as told by Youssef Chahine), highlights relationships between gay men from the West and Egyptians. And true to the conflation of foreignness and homosexuality, Chahine’s film *Wedaʾan Bonapart* (1985; Adieu, Bonaparte) contains a love affair between a French savant and two Egyptian teens. This aspect of *Wedaʾan Bonapart* was quite heavily criticized at the time, and Chahine’s subsequent films often allude even more indirectly to such encounters. It is worth noting that *Iskandariyya ... leh?* deviates from the common account in these other films. Adel is the aristocrat with social power, and he consciously plays with the codes surrounding the imperial nature of Tommy’s presence in Egypt. Unlike the other films that place the Egyptian characters in the position of the seduced, in *Iskandariyya ... leh?* the relationship between Adel and Tommy is one figured explicitly around the war and its structures of domination and insubordination. In this instance, anticolonial sentiments structure the initial plot to deliver Tommy to Adel, and the usual figuration of seducer and seduced is reversed, with Tommy held captive under Adel’s control. No longer a foreign importation imposed on Egypt, homosexuality emerges within the framework of anticolonial resistance.

In addition to the various depictions of same-sex desire between characters, Chahine’s filmography also manifests queerness in other ways, blurring the boundaries between cinematic looking and male bodies. *Iskandariyya kaman wa kaman*, the third film in the autobiographical series, emphasizes the filmmaker’s infatuation with a young actor playing Alexander, even while noting that the filmmaker is married. In these instances, homosexuality is less something broached thematically than something that permeates formal looking relations. In *Al-ʿusfur* (1972; The Sparrow), for example, Chahine presents a male actor stripped to the waist, admiring himself in the mirror as his hand slides down his bare chest toward his groin. When it comes to *Al-masir*, this historical drama presents men wrestling in various states of undress in the bathhouse. Neither of these scenes offers explicit or readily identifiable gay or lesbian characters, but they each make visible a way of looking that routes cinematic seeing outside the conventional optics of women performing for the camera. Much like Chahine himself, who was quite evasive when it came to
questions of his own sexuality, his films demonstrate registers of queerness without embodying these dynamics in recognizably homosexual characters or relationships.

**Formal Queerness in *Iskandariyya ... leh?***

Where there is commentary that treats *Iskandariyya ... leh?* in the context of forbidden relationships, far fewer critics have been attentive to the formal dynamics by which the relationship between Adel and Tommy takes shape. Part of what makes this particular encounter so remarkable is how it interrupts, and seemingly subverts, the conventions associated with the male gaze in classical cinema, especially with regard to the role of women as spectacle. When Tommy is first introduced, he is presented stumbling over himself in a cabaret located below the apartment of Yehia's family. The camera tracks Tommy's movements back and forth across the room as those gathered for the performance turn their attention to him. His drunken singing eclipses that of the performers on stage. As he wanders, he passes in front of the stage and then makes his way back out into the audience. At this point, there is a close-up on the face of Seif El Din, a nationalist intent on ridding Egypt of the British, who stares at the young soldier. It is initially unclear whether Seif El Din's look is lustful or part of a cunning political ploy to entrap him. When Tommy sits down to talk to Seif El Din, he exhibits all the brashness of a drunken soldier, and it becomes clear over the course of the exchange that Seif El Din plans to kidnap Tommy for Adel as part of the effort to thwart the British occupation.

In this initial scene, the viewer's look at Tommy is carefully mediated through a network of glances that frame him as the object of desire—both political, in the sense of a potential captive, and sexual, in the conflation of his place with that of the cabaret performer. As the scene progresses, Tommy drunkenly stands up from the table with Seif El Din and navigates his way backward, presented in long shot as he sings aloud to the music that is playing—or rather, as he sings “The White Cliffs of Dover” over the music that predominates in the cabaret. With the voice of the young British soldier layered over that of the Egyptian cabaret singer, and with the music layering a British song over an Egyptian song, the scene quite masterfully weaves together a number of layers of colonialism, sexuality, and gender. What is objectified in this scene is Tommy himself, a colonial soldier who is the object of the male gaze, at once frozen as a spectacle of a drunken singer and the object of desire.

When the cabaret is interrupted by electrical blackouts and German aerial attacks, the singer implores the musicians to continue. Amid the chaos that ensues, fights break out in the audience, and Seif El Din abducts Tommy, punches him in the face, and the film cuts to newsreel footage of a bomb going off. The film then cuts to a shot of Adel's face behind the wheel of a car, and the viewer learns that Tommy is in the backseat. Adel drags Tommy out of the car and places him over the railing facing the sea before stepping back, pulling his pistol from his jacket, and aiming at the young soldier. At that very moment, drunken
Tommy slumps down from the railing, and Adel moves to lift him up. Already, it is clear that Adel finds himself incapable of following through with the killing. The next shot reveals a close-up of Tommy's drunken face as his arms wrap around Adel in an effort to remain standing, ambiguously straddling an intimate hug and a drunken embrace. In what follows, Adel tells Tommy to act like a man, places him back in the car, and stares down at him as a bell rings and the film cuts to the next scene. When Tommy is next introduced, he is in bed in his underwear as Adel looks upon him with his pistol drawn. The scene proceeds with close-ups on Tommy's face as he asks questions about where he is, how he got there, and who removed his clothes. As the exchange continues, a woman interrupts by walking unexpectedly into the room, and Adel nonchalantly explains that Tommy is a friend and then invites him to join them for breakfast, as though nothing were out of the ordinary.

It is only in a subsequent scene that the nature of what transpired becomes clearer. Adel is shown driving Tommy to his point of deployment for battle. Tommy hands Adel some money, claiming that he has no one closer in his life now, and then adds that he will take it back when he returns from the war. He gets out of the car, walks toward the other soldiers, looks back over his shoulder at Adel, but then returns to the vehicle. When he gets back in the car, he asks Adel if he has, in fact, killed other British soldiers as he intended to do with him, and Adel replies that he has. Tommy curses Adel for his actions and then departs the car angrily. A long shot reveals Tommy walking away toward the soldiers before he looks back at Adel one last time.

What follows of the relationship between Tommy and Adel is revealed most tenderly in a letter that Tommy sends Adel from the front. In a darkened room, Adel is shown reclining in bed with a revolver in one hand and Tommy's letter in the other. Tommy's voice is heard narrating the contents of the letter, as scenes of him at the front appear onscreen. He suggests that he has escaped the shadow of death with the battle now over. As the letter continues and Tommy complains of selfish generals, Adel is shown standing in front of the bed, revolver in hand, shooting his pillow. Toward the film's conclusion, as Adel reports to a military office to search for Tommy, he learns that Tommy did, in fact, die in battle. A close-up on Tommy's gravestone pans out to reveal an entire field of white gravestones. Adel's face is shown surveying the graves solemnly as Vera Lynn singing “The White Cliffs of Dover” plays on the soundtrack. The seemingly impossible love story is one of many casualties of the war.

Senior Lecturer in Religious Studies
Moi University, Kenya

The status of those with nonnormative sexual identities in African Muslim communities.

Same-sex sexuality in African Muslim societies has always existed, but in the twenty-first century it has become more visible. Matters of sexuality have traditionally been dealt with quietly, with public discussion of sexuality considered an affront to cultural ideals of respectability. Given the prominent role played by Western nongovernmental organizations in the advocacy for LGBTQ rights, it is not difficult to see why Islamic religious leaders view nonnormative sexual expressions as a foreign practice that should be condemned. So the irony is that the call for LGBTQ rights, which requires public outing, may actually backfire on those with nonnormative sexualities (Massad 2002). The hatred expressed by the general Islamic clerics (ulema) and some of their followers toward homosexuality has created a hostile environment in which most LGBTQ persons are scared to declare their sexual orientation. On account of the dominance of the ulema in the public domain of their respective communities, homosexuality is projected by most Muslims as a perversion and reversal of the natural sexual orientation of human beings. This makes being a homosexual in African Muslim societies an enormous challenge given the vitriolic attacks from conformist ulema.

Generally, there are several modes that are associated with the spread of Islam in Africa. With significant expansion in the twentieth and twenty-first centuries, Islam has been reinterpreted differently by various Muslim communities on the continent. Regional differences are evident as the cultures of indigenous African societies were integrated with the practices of Islam that readily accommodated them. Islamic accommodation to African cultures has contributed to the observance of a particular form of Islam that differs from one region to the other (Lapidus 2014). Thus, Islamic practice in Africa is very diverse and has changed over time with the ebb and flow of different schools of Islamic jurisprudence, such as the Shafi’i, Maliki, Hanbali, and Hanafi. This variation is also evident when dealing with issues of sex and sexuality. Despite the Qur’an’s lack of a proper term for homosexuals as a concrete idea designating same-sex sexual desires, Muslim ulema in Africa use the particular Qur’anic narrative of the destruction of the cities of Sodom and Gomorrah (see Qur’an 7:84) to condemn homosexuality as a perverse act, with limited theological bases for tolerating it. Even “the terms that became popular in Arabic in later times (Liwat for
acts associated with same-sex relations, and Luti for persons associated with these acts) are not found in the Qur’an at all” (Kugle 2003, 200). But because of the lack of a specific punishment for same-sex relationships in the Qur’an, the decision to arbitrate on the practice was left to the discretion of the local ruling authorities, as observed in Islamic history, which explains the varied attitudes toward LGBTQ persons among African Muslims.

Within Africa south of the Sahara, Islamic expression has demonstrated conflicting views despite nonnormative relations being strongly associated with certain Muslim communities. Historically, in West Africa, Arab Muslims were accused of male-male sexual exploitation and rape during the sixteenth-century conquest of Songhai, while in East Africa Arab Muslim traders “had a reputation for enjoying if not promoting male-male sexual relationships” during their contact with the local population (Epprecht 2013, 95).

Despite the supposed heterosexual emphasis within the Islamic tradition, in Muslim societies, including those in Africa, same-sex practices also seem to have been relatively accommodated (Murray 1997; Eppink 1992). Apart from the reputations of North African Muslim countries (Morocco, Algeria, and Tunisia) as destinations for homosexual escapades in the European imaginary, in Africa south of the Sahara cases of nonnormative sexual expressions by Muslims can be drawn from Senegal, Nigeria, Kenya, and Zanzibar, among others. Among the Wolof Muslims of Senegal, “homosexuals” (gor-digen) are transgendered men who, among other services, offer sex to other men (Epprecht 2013). A similar community of homosexual men (‘yan daudu) is found in northern Nigeria, and among them are people who identify themselves as devoted Muslims. They are known to provide sexual services for supposedly heterosexual “men either as sex workers themselves or procurers of female sex workers” (Epprecht 2013, 98). In Kenya, mainland Tanzania and Zanzibar, shoga (or hanisi or liwati) refers to the passive partner in a same-sex sexual relationship (Amory 1998).

Despite this seeming tolerance of nonnormative sexuality in African Muslim communities, Islam has a reputation for homophobia. Muslim critics of nonnormative sexuality have claimed that the Qur’an is clear in its condemnation of the practice, as indicated above. While there are variations in the punishment for known homosexuals, in some Muslim-majority countries such as Mauritania and Sudan and in certain states in northern Nigeria punishment includes the death penalty (Global Legal Research Center 2014). The coexistence of cultural acceptance of nonnormative sexualities with harsh condemnation points to a radical contradiction with regard to attitudes toward the practice among African Muslims—a theme explored in this entry. The extent to which African Muslim communities have tolerated homosexuality is the focus of this entry, which describes varied attitudes and opinions. Paradoxically, the idea of emphasizing heterosexual sexual fulfillment in some African Muslim societies through female initiation processes has to a certain extent promoted same-sex tendencies among them, as shown in this entry. The apparent signs of
acceptance of same-sex practice, however, have not stopped state and Islamic religious leaders from mobilizing hostility and public religion against nonnormative sexual persons. Therefore, this entry will demonstrate the challenges that African Muslims in same-sex relations face as a result of their status—from the religious clerics and, to a certain extent, the state. In that respect this entry will demonstrate the traditional existence of tolerance toward nonnormative sexualities in African Muslim societies, exploring why same-sex practice has become a public issue of concern among them. This earlier acceptance will be contrasted with the contemporary condemnation of nonnormative sexual expression as manifested on the continent.

**Sex and Sexuality**

In Islamic tradition, sexuality is not an obstacle to spirituality; in fact, the faith values the pursuit of sexual pleasure within specified limits. In this respect, sexual gratification within marriage is regarded as sacred in Islam (Azad 2016). As a result of the enormous value placed on lawful sexual relations, certain Muslim communities in Africa have designed ways of attaining this fulfillment through female initiation (Omar 2012). By the nineteenth century, *unyago* female initiation was a popular practice among coastal Swahili Muslim communities and became the tradition of preparing young girls for marriage, which began with seclusion. When girls experienced their first menses, they were secluded from public interaction with members of the opposite sex to safeguard their sexual purity. In a given locality, the mothers of the young girls would identify older women as instructors (*somo* or *kungwi*) to organize an initiation ritual that lasted for seven days. The *kungwi* provided the young initiates with information regarding female sexuality and morality through the performance of *unyago* rituals and dances (Fair 2004). While the initiation took barely a week, it was the beginning of a lifetime bond between the initiate and the *kungwi*, with the former always seeking advice about marriage, reproduction, and child-rearing from the latter.

During the initiation ritual dance (*unyago*), the young girls were instructed in the art of sexual intercourse. They learned the technique of seductively gyrating their hips, thighs, and buttocks to promote sexual gratification. As a way of mastering the skills to pleasurable sex, the girls tried the techniques on each other, a performance that aroused them sexually. Undoubtedly, the act exposed the female initiates to homosexual experiences. Despite the tacit acceptance of nonnormative sexuality, the female initiation dances provided instruction in “male and female physiology, the physical aspects of sexuality, desire and orgasm, masturbation, and physical relations between men and women” (quoted in Decker 2014, 224). Significantly, the instruction of the dance initiation was designed to produce girls who were skilled lovers and appreciated that the enjoyment of sex was a fundamental aspect of a marriage relationship. While late nineteenth-and early twentieth-century Islamic reformers in Zanzibar claimed that the initiation exposed young “girls to putatively
pornographic information about sex” (Decker 2014, 216), many Swahili Muslims did not see any contradiction between these practices and their faith. Despite the great emphasis on heterosexual relations, same-sex sexuality also prevailed in numerous Muslim societies in Africa, as illustrated below.

**Transgressing the Gender Categorization**

In Swahili Muslim society (Kenya, Zanzibar, and mainland Tanzania) there exist male homosexuals (shoga; plural mashoga) who take the passive role during anal intercourse with a male partner (Amory 1998). Though tolerated, mashoga are considered not to be living consistently with the expectations of a man in Swahili society because they violate “gender position” (Amory 1998, 78). Even though the early crossings of gender boundaries by the mashoga were sometimes harshly castigated, they were also to a certain degree accepted in society through sexual relations with other older men, including teachers (both religious and secular), neighbors, or even relatives. In certain instances, a passive male homosexual among Swahili coastal Muslims would marry a woman but secretly continue engaging in nonnormative sexual behavior (Shepherd 1987). Apart from the conduct being seen as a way of concealing the mashoga’s sexual orientation, marriage in Islam is half of one’s religion, which mashoga appear eager to fulfill.

In coastal Muslim society, societal roles are defined by gender, and they are linked with other gendered behaviors, including dress and speech. Because social space contributes to the construction of gender identities, the public spheres that mashoga occupy indicate their gender as being dissimilar from other men, but akin to women, although “not exactly the same as women, either” (Amory 1998, 79). On account of their nature, mashoga easily interact with women, crossing the stringent boundaries of gender segregation, which is customarily difficult for other men to do (Larsen 2008). Because gender is a social construction, mashoga perform it by being commonly identified by feminine alternative nicknames, as well as by dressing in a way that attracts male sexual partners. Clearly, male homosexuals in Swahili Muslim society violate gender categorization by appearing like women by assuming certain societal gender markers, but without much discrimination.

Generally, it is alleged that during the prerevolutionary era in Zanzibar same-sex relations were considered a normal practice— and even secretly observed during the month of “Ramadan when heterosexual intercourse is prohibited” (Middleton 1992, 120), a view that could not be confirmed in other parts of the Muslim world. In this Muslim society, nonnormative sexual individuals “had their space without having to fight for it” because “the society was neither encouraging them nor subjecting them to any kind of persecution” (Saleh 2009, 199).

Among the Muslim Hausa of northern Nigeria, the ‘yan daudu are men who constitute what can be referred to as a male homosexual community. Their social closeness to women provides cover for certain “men who seek men,” thereby allowing them to secretly interact
without attracting attention. Among the Hausa, nonnormative male sexuality is not viewed as an inclination, but merely an act; hence, gays are described “as men who do homosexuality [rather] than as men who want other men sexually” (Gaudio 1998, 117). In addition, same-sex practice in this Muslim society is not regarded as being in conflict with a heterosexual identity. At a certain moment in their lives, ‘yan daudu are also expected to marry women and have children, even as they discreetly continue with their nonnormative sexual affairs. This characteristic of the ‘yan daudu should not be interpreted as an expression of bisexuality, because in Hausa society marriage is not a choice of an individual but a moral responsibility for every member of society. As a result, even homosexual men are at least expected to “have sex with women” for procreation purposes “and not necessarily for sexual pleasure” (Gaudio 1998, 118).

The ‘yan daudu's inconspicuous engagement in sexual relations with other men is culturally interpreted in terms of gender rather than as a form of sexuality. Because of their feminine gestures and performance of tasks associated with women (cooking and selling food), their behavior is seen only as being “womanlike,” without necessarily forfeiting their fundamentally male identity. And because ‘yan daudu secretly engage in nonnormative sexual expressions, the general society ignores their crossgender conduct and same-sex connotations. Apart from ‘yan daudu always referring to themselves with feminine names, they also consider themselves wives while describing their sexual relations with their male partners. Rudolf Pell Gaudio observes:

*By employing heterosexual concepts to characterize their own sexual roles, ‘yan daudu and their [male partners seem to conform to] dominant ideologies of gender and power relations while challenging others. For, whereas the idea of a man who has a “husband” and calls himself a “wife” disrupts mainstream Hausa beliefs about gender and sexual identity as biologically based, the sexual, economic, and other expectations that ‘yan daudu and their boyfriends/husbands bring to their relationships follow mainstream norms governing how women and men should behave in heterosexual relationships.*

(1998, 121)

As a result of religious and cultural influences the ‘yan daudu conform to the belief that gender is divinely determined, which is why they still marry women as a way of fulfilling one of their religious obligations as men. Clearly, the ‘yan daudu’s exhibition of femininity does not nullify their male social identity, which they consider as God’s will that they cannot alter. And because they identify themselves as practicing Muslims, they believe that it is Allah who created them different from other men (Gaudio 2009).
Among the Muslims of northern Sudan, there is a healing cult (zar or zaar) that is primarily the realm of women. Despite the cultural sexual division of labor and sexual segregation in this society, there are also a number of men who frequently partake in zaar rituals, with some of them even becoming cult group leaders. While some of the men who often attend zaar rituals are suspected by the society of being nonnormative sexual persons, others are accused of merely pretending to be sick to disgracefully gain access to the women in the cult (Murray 1997). Despite the seeming acceptance of same-sex practice in African Muslim societies, in some conservative segments of the Muslim population, as a result of the emergence of Islamic reformist ideas in Africa, those with nonnormative sexual identities are periodically condemned as the source of sexual immorality and thereby subjected to denunciation and abuse.

**Religious Mobilization against Nonnormative Sexuality**

In Zanzibar, while nonnormative sexuality was considered by some to be an inconsequential transgression understood to occur as a result of God’s will, it was also despised by other members of society. This is also true of other African Muslim societies where religious leaders and politicians have come together in an alliance to persecute homosexuals. Religious mobilization against same-sex sexuality in Africa, therefore, is part of the broader political dynamics evident in various African countries where it is viewed as a struggle for the preservation of presumed Islamic, and sometimes African, identity against a domineering Western culture. Out of fear of losing their somewhat overlapping identities, the mobilization is an effort to protect Muslim societies against the hegemonic legacy of Westernization.
In Kenya, which has a significant Muslim minority, some Muslim clerics have called on Kenyans to reject same-sex sexuality because, according to them, it is an act that is contrary to religion as well as to African traditions and beliefs (Ndzovu 2016). They claim that nonnormative sexuality is prevalent in Kenya because of Western influences. As a result, Muslim clerics in the country have strongly fought against any recognition of LGBTQ rights. For instance, they have criticized a proposal to include questions pertaining to nonnormative sexuality in the national census as tantamount to validating its existence. It is the open expression of nonnormative sexual identity that has irritated many Kenya Islamic clerics, who caution that such public acceptance could “easily anger God and invite calamities such as the fire that claimed Sodom and Gomorrah” (Christian Telegraph 2012, np). Yet, the belief that it was same-sex sexuality that caused the destruction of the two cities has been the subject of contestation by scholars (Kugle 2003).

Alarmed by the boldness of some activists advocating for the rights of LGBTQ persons through the support of some Western countries, Muslim clerics in Kenya have suggested that the government “stop taking aid from countries” that “support gay rights,” claiming that such aid could come “with the condition of Kenya supporting gay rights” (Out in Perth: Something Different 2014, np). The increase in homophobic expression coincides,
beginning in the 1990s, with increased agitation for LGBTQ rights by numerous organizations. The most visible LGBTQ organizations in Kenya include the Gay and Lesbian Coalition of Kenya and G-Kenya Trust, whose campaigns are considered an affront to the cultural norm that treats issues of sexuality quietly and away from the public gaze. Undoubtedly, the appearance of the pro-LGBTQ organizations in the country advocating for public display of nonnormative sexuality disturbs the culturally accepted, discreet same-sex relations—hence the opposition (Ndzovu 2016).

In Zanzibar, the seeming accommodation accorded by society to those with nonnormative sexual identities started shrinking after the 1964 revolution as a result of religious and political mobilization. Islamic reform ideas emerged that criticized the past, implicit approval of nonnormative sexual practices in the society (Moen et al. 2014). Apart from religious mobilization, Zanzibar’s criminal law provides that a “person who will be convicted of sodomy will be liable to 25 years imprisonment” (Ottosson 2008, 37). Furthermore, the state’s mobilization against homosexuals is evident through the 1984 censorship board, which among other tasks, has a mandate to “review [taarab] songs … before they [could] be performed and aired” because there has been “a particularly virulent exchange of taarab songs concerning homosexuality” (Arnold 2002, 148). Along the Swahili coast, taarab is a popular form of sung poetry that incorporates performance and instrumental accompaniment and sometimes offers scathing and obscene lyrics depicting sexism (Mosoti 2012), compelling the state to introduce controlling measures.

Perhaps stemming from the influence of Islamic revival movements, there is a group of Muslims in Senegal vandalizing graves and exhuming bodies of supposed LGBTQ persons. Before 2008, Senegal was one of the predominantly Muslim African countries considered to be tolerant toward same-sex sexuality, despite the threat by groups of Muslims that they would attack anyone who openly violated culturally approved sexual orientation. As a consequence, in certain parts of the country, Muslim youth exhumed the bodies of known gor-digen because the latter were deemed to be defiling the graveyard (Awondo, Geschiere, and Reid 2012).

Despite the homophobic expressions evident in African Muslim societies, there are other Muslim clerics who have condemned such actions and have instead urged the acceptance of LGBTQ persons in their communities. For instance, in South Africa, this positive attitude toward nonnormative sexuality is represented by Imam Muhsin Hendricks (1970—), whose mosque provides “LGBT Muslims a safe space in which to worship, away from the condemnation” of conservative Muslim clerics, “many of whom see homosexuality as a sin” (Bruce-Lockhart 2017). A gay Muslim himself, Imam Hendricks in 1996 founded the Inner Circle, a support group for Muslim individuals in same-sex relationships who feel rejected by their religion because of their sexual identity. Hendricks has called on the general Muslim community “to stop the killing and violence perpetrated against queer people in the name of Islam,” and has urged his fellow imams instead to use the mosque pulpit during the
Friday prayer to deliver a message of inclusivity and accommodation (quoted in Arcus Foundation 2017).

In the cases illustrated above, same-sex relations seem to intersect with heterosexual marriage and reproduction. Male nonnormative sexual individuals are aware of the societal expectation that requires them not to upset the heterosexual norms of patriarchal dominance in society. “Indeed, they often explicitly reinforced those norms provided the relationships remained discreet (not talked about or seen) and discrete (kept separate from and not interfering with the needs of family, kin and nation),” Marc Epprecht (2013, 100) argues. As shown from the various examples, same-sex sexual practices among African Muslim societies differ from the Western understanding that allows public displays of nonnormative sexual identity. In response to the increasing public visibility of same-sex relationships, Muslim clerics arose to counter the emerging trend, insisting that it contravenes Qur’anic teachings. However, the texts dealing with homosexuality in the Qur’an have been variously interpreted by different Muslims.

The Jamaica Forum for Lesbians, All-Sexuals and Gays (J-FLAG) emerged in 1998 after the dissolution of Jamaica’s Gay Freedom Movement (GFM). Jamaican activist Larry Chang formed GFM, the first gay rights movement in the Caribbean, in the mid-1970s. GFM’s goals were to raise consciousness among members of Jamaica’s LGBT community and to advocate for gay rights. GFM published a newsletter, in addition to running programs for LGBT youth, a prison outreach, and a free STD (sexually transmitted disease) clinic. GFM’s closure occasioned the need for specific LGBT interventions on the island. Members of the community, including Chang, Brian Williamson, and Ian McKnight, held a series of meetings and workshops in Kingston to develop new strategies and approaches for LGBT advocacy. They launched J-FLAG on 10 December 1998, with a formal announcement to members of the press on International Human Rights Day.

McKnight and Donna Smith were the first cochairs of the organization, and Julius Powell, Philip Dayle, Akin Hubbard, Thomas Glave, and others would later join as members. The primary goal of the organization was to repeal Jamaica’s “buggery” law—a holdover from the British colonial era (1650–1962) that continued to criminalize anal sex and other forms of sexual intimacy among men. They also sought to lobby political leaders to add sexual orientation to the nondiscrimination clause of the Jamaican constitution, which was established when Jamaica gained independence from England in 1962. In the 1990s the government formed the Joint Select Committee on the Charter of Rights to receive submissions from various interest groups and sectors of the public in order to develop a new charter of rights. JFLAG’s public submission to the committee was one of the organization’s first official actions as a gay rights organization.

Given that the founders had limited activist experience and that the organization had little funding, initially J-FLAG operated out of the offices of Jamaica AIDS Support for Life (JASL) —the country’s oldest and largest human rights organization dedicated to fighting the AIDS epidemic and to advocating for people living with HIV. The challenge of separating JASL from J-FLAG became a point of contention among members, and eventually J-FLAG
branched out into its own offices. Following their submission to parliament, however, J-FLAG’s members received anonymous death threats. Subsequently, J-FLAG remained largely underground until Williamson, an upper-middle-class Jamaican gay activist, agreed to be the public face of the organization. Williamson purchased a house and established a nightclub that became the most popular and most visible space for LGBT people in Jamaica. He would often offer financial support and employment to individual members of the community, including to a young man named Dwight Hayden, who, for reasons that remain unclear, murdered Williamson at his home in 2004. When Williamson’s body was discovered, people from surrounding communities assembled outside his home and publicly celebrated his death. Following his murder, J-FLAG returned to operating underground. Over the decade that followed, however, leaders of the organization gradually began to reemerge in media interviews, and by 2015, J-FLAG had returned to being more visible.

Since its founding, J-FLAG has undertaken several activist projects, including a letter-writing campaign to national newspapers, a help line, workshops for members of the community, advocacy training, and, the submission to the Joint Select Committee on the Charter of Rights calling for the inclusion of sexual orientation as a category for nondiscrimination in Jamaica’s constitution. While the submission was unsuccessful, it established J-FLAG’s status as the island’s foremost gay rights organization on the national stage. J-FLAG has also organized a men’s netball league, game nights, and frequent social events for LGBT communities.

Recently, J-FLAG has taken a more visible approach to its advocacy. In 2015, it organized its first annual pride parade, which coincided with national celebrations of Jamaica’s independence. J-FLAG frequently publishes online magazines with positive images of LGBT Jamaicans and with messages, information, and manifestos geared toward empowering members of the community. J-FLAG also has several new affiliate organizations, such as TransWave, an advocacy group for trans Jamaicans founded by Neish McLean in August 2015, and WE-Change, an organization dedicated to lesbian, bisexual, and trans women. J-FLAG’s new approach seeks to diversify and expand its advocacy to facilitate a broader, more multifaceted engagement with human rights in Jamaica.

Barrow, Christine, Marjan de Bruin, and Robert Carr, eds. Sexuality, Social Exclusion, and

The modern Arabic novel has generally lacked complex representations of lesbianism, particularly in comparison to the more nuanced engagements with female homoeroticism in the medieval Arabo-Islamic literary tradition. Medieval Arabic literature includes vivid portrayals of romantic and sexual relations between women. Furthermore, medieval Arab lesbians “are said to have formed groups, to have held meetings, and to have led schools in which they taught other lesbians how best to achieve pleasure” (Amer 2009, 219).

The neglect of nonnormative gender and sexual identities in modern Arabic literature may be attributed to a number of factors, including but not limited to the impact of colonialism, increased censorship and authoritarianism, and sociopolitical changes in the contemporary Middle East (al-Samman 2008; Malti-Douglas 2001; Habib 2007; Amer 2012; Massad 2007). When female homosexuality does appear in the modern Arabic novel, it is typically constructed as a less desirable substitute for heterosexuality. Moreover, lesbian body politics are often subsumed by the text’s feminist agenda. The Syrian writer and researcher Iman al-Ghafari argues that “the feminist discourse that turns lesbianism into a political choice is not liberating. Instead, it puts lesbians in a troublesome position where they have to play a major role in fulfilling the desires and fantasies of some heterosexual feminists at the expense of their true lesbian desires” (2002–2003, 87). In a similar vein, the literary scholar Hanadi Al-Samman contends that “the adherence to a politicized passive/active ‘femme/butch’ formula that is clearly anchored in heterosexual and feminist politics rather than in lesbian body politics” stands in the way of engendering complex literary engagements with Arab female homoeroticism (2008, 301). Barring a few exceptions, including Elham Mansour’s Aná hiya anti (2000; I Am You [2008]) and Nihad Sirees’s Halat shaghaf (1998; A case of passion), most modern Arabic novels do not provide profound engagements with lesbianism, let alone feature well-developed lesbian protagonists.

Nawal El Saadawi’s Jannát wa-Iblīs (1992; The Innocence of the Devil [1994]) is among the novels that offer a reductionist treatment of lesbianism. Once the transgressive character Narguiss proclaims her lesbian identity, she meets a bloody death and does not have the opportunity to truly experience lesbian life (and love) out of the closet. Furthermore,
lesbian body politics are often overshadowed by the text’s predominantly feminist agenda. Despite its limitations in exploring lesbian identity, however, the novel does challenge the pervasive discourse of lesbianism as sin, and it gives voice to (lesbian and heterosexual) female protagonists who question dominant religious and cultural norms that engender the maintenance of a heteronormative patriarchal order. Incorporating religious allusions, intertextuality, symbolism, flashbacks, dialogue (in both formal Arabic and Egyptian dialect), and fantasy and realism, El Saadawi’s postmodern novel examines such topics as patriarchy, gender violence, theology, and lesbianism. This entry focuses on the novel’s portrayal of lesbianism and female subversion of patriarchy.

© MARINA HELLI/AFP/GETTY IMAGES
Tunisian Egyptian Writer Nawal El Saadawi. El Saadawi is perhaps the most recognized Arab woman writer in the world and an ardent feminist. Her works focus on often taboo topics related to women’s rights and sexuality, as is the case with Jannāt wa-Iblīs.

Synopsis and Reception of the Novel

Set in a mental institution, Jannāt wa-Iblīs recounts the experiences of four inmates and the two authority figures tasked with overseeing their treatment and ensuring that they are properly monitored and disciplined. The inmates include two females by the names of Ganat and Nefissa; a male patient with the Arabic devil’s name, Eblis; and a male patient carrying the deity’s name (referred to in the English translation as “God”). The authority figures include the female Head Nurse/Narguiss and her superior, the male Director. As the novel unfolds, the reader becomes privy to the past lives of the asylum inhabitants, who have been scarred by traumatic experiences, including abuse by authority figures, failed relationships, and stigmatization. The asylum, however, does not provide a refuge from past trauma, nor does it offer a space for healing or empowerment. As the gender studies scholar Fedwa Malti-Douglas argues, the asylum “is a place where the past assumes center stage, governing and delimiting the actions of the individuals” rather than a space that engenders “forward vision” (1994, xiv).

Despite its association with the Garden of Eden, the asylum is not a paradise by any means. On the contrary, the injustices that happen behind the asylum’s closed gates mirror and
intersect with those that have occurred in the “real world” outside it, particularly the recurrent physical and mental violation of vulnerable populations. Even the devil, with whom the female characters are often linked, is depicted as a scapegoat who receives his share of oppression at the hands of the male deity. It is the women, however, who receive the biggest share of abuse in the asylum. Most poignantly, Nefissa is raped by the deity shortly after invoking him with the words “ya rabb”—that is, “O God” (El Saadawi 1994, 82). As she is being sexually assaulted by the inmate referred to as God, she recalls the instructions of Sheikh Masoud, the religious leader in her village, regarding the importance of keeping her eyes shut in the face of God’s powerful light. Blinded, literally and figuratively, Nefissa cannot even face her assaulter, let alone defend herself. Nefissa’s story draws attention to the instrumentalization of religion as a means of manipulating women. While Nefissa’s story highlights the victimization of women at the hands of male authority figures, the story involving the Head Nurse/Narguiss, Ganat, and the Director demonstrates both the condemnation of lesbianism and female resistance against a patriarchal, heteronormative order.

_Jannát wa-Iblīs_ is often regarded as a sequel to El Saadawi’s novel _Suqut al-Imam_ (1987; _The Fall of the Imam_[1988]), which also provides a scathing critique of religious figures who abuse their authority and exploit women. Similar to _Suqut al-Imam_, _Jannát wa-Iblīs_ was controversial in Egypt, as some religious clerics considered it yet another example of El Saadawi’s blasphemy and her disregard for religion. The novel has been compared to Salman Rushdie’s _Satanic Verses_ (1988) in its transgression. It also contributed to promoting El Saadawi to the top of the Islamists’ death list (Cooke 2015). The novel has received mixed reviews in the West. Some critics have praised El Saadawi for her authoritative engagement with theology and tenacious rewriting of patriarchy. Others, however, have criticized the novel for its simplistic portrayal of Arab women as endless victims and Arab men as unequivocal oppressors, as well as its stylistic weaknesses, including its abstract and overwritten prose.

**Demonization and Disavowal of Lesbianism**

Soon after Ganat enters the asylum, she meets with the Head Nurse and the Director. Ganat seems to recognize the Head Nurse and inquires if she is “Narguiss.” However, the Head Nurse disavows the name with a “nervous shake of her veiled head as though refuting something” and solemnly declares that she is simply the “Head Nurse.” She fidgets with her whistle, twirls “the long chain with her finger like a rosary,” and mutters “a verse to chase away the evil spirits” (El Saadawi 1994, 11). The Head Nurse’s elusive response—her inability to verbally assert that she is not Narguiss—and her distraught demeanor suggest that the two women have been indeed acquainted in the past. In the mind of the Head Nurse, the women’s past relationship must have been “sinful,” as evidenced by her attempt to ward off the evil spirit and use her chain as makeshift prayer beads at the mere allusion
to her past liaison with Ganat. As the novel unfolds, the reader learns of the women’s past relationship and their fondness for one another.

In a chapter titled “Guilt,” Narguiss recalls her admiration of her best friend Ganat, starting with her name, which means “many paradises,” and her self-confident demeanor, despite being afflicted with a dark complexion like the devil. Narguiss remembers feeling ecstatic upon seeing Ganat and describes how “their bodies would fuse into one another, and she and her friend would become as one” as they hugged closely (124–125). When a schoolteacher asks Narguiss whom “she loved the most,” Narguiss replies that it is Ganat, rather than choosing her mother or father as expected. The narrative suggests that the two girls may have been romantically involved or that, at the very least, their friendship had the potential of developing into a full-fledged lesbian relationship. However, this lesbian love is not allowed to flourish. Narguiss’s unconventional response to the teacher’s question earns her a “zero for manners” and prompts a rumor about “a kind of love which the Devil was trying to make appealing to the hearts of the girls” (128). The text emphasizes that not only do the two girls share the devil’s dark complexion and his propensity for disobedience and nonconformity, but they are also perceived as being lured by the devil into falling in the “wrong kind” of love, which ruins their reputations as rumors start to spread in their conservative neighborhood.

It is worth noting that the association of femaleness (not just lesbianism) with the devil recurs throughout the novel, both literally and metaphorically: he is the serpent-like creature who appears in the cracks of the decrepit walls in the female ward, he is Nefissa’s mischievous brother, and he is the angel Ganat most admires because of his distinctive refusal to kneel before God. The women’s constant association with the devil signifies their “guilt by association.” It follows that the “innocence of the devil,” which the narrative ultimately reveals, suggests the innocence of the women as well. In other words, the novel’s final verdict complicates the dominant narrative that has rendered both the female characters and the devil as deviant partners in crime.

The Director prescribes solitary confinement and three sessions of electric shock therapy as a treatment for Ganat. The text’s reference to electric shock therapy, which ultimately results in a substantial loss of memory, is highly symbolic: for the Head Nurse to maintain the facade of normalcy in her current position as an authority figure, as well as a heterosexual woman who is sexually involved with the Director, both she and Ganat must put their intimate relationship behind them. While the Head Nurse/Narguiss deliberately denies any previous knowledge of Ganat, Ganat is forced to forget the past through an invasive medical treatment that targets her body and mind, forcing her into compliance. Her lesbian (or lesbian-like) past represents a badge of shame that must be forcefully extracted from her memory.

Reclamation of Lesbian Identity and Qur’anic Exegesis
In this novel, El Saadawi creates a narrative space where lesbianism is explored in the realm of theology, not just in everyday life. After Ganat undergoes treatment, she loses her memory and stops referring to the Head Nurse as her childhood friend Narguiss. Satisfied with her “progress,” the Director declares her as cured and ready for release from the asylum. However, when the Director attempts to hand the Head Nurse Ganat’s hospital discharge forms, the Head Nurse looks him straight in the eye and does not budge, a move that stands in contrast to what she had done for thirty years: “reach[ing] out with her hand to take written orders from him ... unable to lift her eyes to him” (El Saadawi 1994, 172). The conversation that ensues between the Head Nurse/Narguiss and the Director merits a close analysis:

–What’s the matter with you, girl? ...
–My name is Narguiss, not girl.
–Since when, you girl? ...
–From now onwards.
–Prepare the beer and the snacks. I’m coming to see you tonight.
–I’m leaving, leaving everything.
–Where are you going? To another man?
–I hate you. I hate all men.
–You love women now, eh?
–Yes.
–You’ll go to Hellfire with Lot’s mother.
–No, sir, I won’t.
–To be a lesbian is a sin, don’t you know that?
–No, sir. It is not mentioned in God’s book.
–You fallen woman. You whore.

(172–173)
Up until this point in the narrative, the Head Nurse/Narguiss may be considered both a complicit participant and a victim of the heterosexist system she inhabits. As the Head Nurse, she exerts power and control over the inmates and participates in managing their docile bodies using electric shock and medication. At the same time, she is a victim of shaming and humiliation at the hands of community members who find her relationship with Ganat deviant, as well as the men and women who later witnessed her failure to prove her chastity on her wedding night. In fact, the Director seems to believe her side of the story: that although she did not bleed on her wedding night, she was a virgin upon entering the marriage. He even explains to her that the most likely reason she did not bleed is that her hymen is “elastic.” Despite understanding Narguiss’s predicament and the injustice committed against her, however, the Director becomes the immediate beneficiary of Narguiss’s ostracization and her sense of worthlessness. He exploits her sexually and professionally behind the asylum’s doors.

Feeling a sense of loss upon realizing that Ganat has finally forgotten her as a result of being “cured,” Narguiss finally rebels against the Director and the patriarchal system that empowers him and undermines her identity as a woman and as a lesbian. First, she reclaims her womanhood by refusing to be referred to as “girl,” and she insists that she has a name, Narguiss. She then challenges the Director by declining to receive and serve him in her room and announces her decision to abandon him. When he assumes that she must be involved with another man, she confronts him and strips him of his alleged knowledge—which he had lorded over her for decades—by declaring that she actually hates all men, including him. By answering “yes,” to the Director’s question regarding her preference for women, Narguiss reclaims her lesbian identity that she has been forced to repress.

The last few lines in the dialogue reveal Narguiss’s daring in challenging the Director’s knowledge of the Qur’an and her powerful intervention in the interpretation of religious scripture. Narguiss argues that, contrary to the Director’s belief—and contrary to popular belief—the Qur’an does not condemn female homosexuality by virtue of the fact that female homosexuality is not mentioned in the Qur’an. Narguiss is right in that the Qur’an does not specifically mention lesbianism, or suhaq (the Arabic word for “lesbianism” that the Director uses), at all. As Al-Samman notes, “Female homosexuality is considered to be a sin only if one uses the *qiyās* Islamic rule of jurisprudence (according to which one act is banned because another of a similar nature is)” (**2008**, **300**). In a similar vein, the gender and sexuality studies scholar Samar Habib contends that “there is nothing to suggest that the Qur’an prohibited female homosexual activity” (**2007**, **60**). In other words, while male homosexuality is referenced in relation to the story of Lot’s people, the Qur’an does not include any reference to female homosexuality or to any punishment relating to it.

In her interpretation of this scene between Narguiss and the Director, Malti-Douglas argues that by demonstrating her “superior knowledge of the religious tradition,” Narguiss proves her ability “to subvert this seemingly eternal alliance between males and the religious
tradition” (1995, 204). If knowledge is power, then Narguiss has now reversed the power dynamic between her and the Director. Furthermore, it is important to note that Narguiss shifts her speech from informal Egyptian Arabic (al-ʿamiyya al-misriyya) to standard Arabic (fusha) when she references the Qurʾan, therefore asserting not only her awareness of the Qurʾan’s position on homosexuality but also her authoritative command of formal Arabic, the language of the Qurʾan and of Qurʾanic exegesis. Not only is she not just a “girl,” but she is a lesbian who is capable of authoritatively engaging in theological discussions. Narguiss’s retaliation against the Director and her protest of a dominant narrative that constructs lesbianism as a religious sin may be contrasted with her earlier (elusive) reaction to Ganat’s question regarding her name. She now confidently asserts her name and her lesbian identity, and she has no qualms about referring to the Qurʾan as a means of defending herself against the charge of engaging in “sinful” behavior.

**Death of the Lesbian Character**

Narguiss’s proclamation of her lesbian identity and her rebellion against the Director turn the world of the novel upside down and lead to insurmountable chaos: “The sky had
collapsed on the earth. Police cars ran over it, their wheels turned upwards to the sky.... Whistles echoed, and bells rang, the bells of schools and the bells of churches. Sounds like bells ringing also came from the minarets (El Saadawi 1994, 173). In this surrealistic and hyperbolic scene, the educational, religious, and law enforcement institutions all sound their alarms at this unprecedented news. They are all implicated for propagating patriarchal values and policing gender and sexuality. As Narguiss attempts to run away from the asylum, her eyes shining with a “new gleam, like the eyes of another woman, happy to be free,” she is caught up in the mayhem around her (174). Narguiss is then transformed into a white butterfly. Another butterfly joins her, and the two hover and laugh. However, the freedom of the two butterflies is short lived as the butterflies are shot and drop to the ground, bleeding. The plot suggests that the second butterfly embodies Narguiss’s childhood friend Ganat.

Although Narguiss succeeds in resisting the patriarchal order and proclaiming her lesbian identity, she ultimately shares the destiny of most homosexual characters in Arabic literature: an inescapable and bloody death. Therefore, while the novel disrupts the dominant discourse about the condemnation of lesbianism in the Qur’an, it does not provide an alternative narrative regarding the tragic fate of the lesbian character. Narguiss’s premature death also precludes a thorough examination of her life and sexual identity as a lesbian. It is in this sense that the novel both challenges and reinscribes dominant narratives about female homosexuality.

BIBLIOGRAPHY

The etymology and significance of the term *jotería* is important to understanding the relatively new but growing academic field known as jotería studies. The term *jotería* derives from the colloquial Spanish-language term *joto* (sissy, faggot), one of three pejorative terms (the others being *puto* and *maricón*) for gay men in Mexico and in Mexican and Chicanx (a gender-neutral version of Chicano/a; also, Latinx) communities in the United States. According to Robert Buffington (1997), the term *joto* resembles a bastardized past participle of the word *joder* (to fuck), but Buffington suggests the word derives not from *joder*, but from *Jota* (Cell Block J) of the Lecumberri federal penitentiary—in existence from 1900 to 1976—in Mexico City, where prison authorities kept effeminate men isolated from the rest of the prison population starting in the early part of the twentieth century. Prisoners in Cell Block J were called *jotos*, Buffington posits, and the word became synonymous with homosexuality; yet, the word existed before this period. Although for some *jotería* is a stand-in for the US umbrella term *queer*, *jotería* has a cultural, linguistic, and political specificity not captured in *queer*. Given the Mexican and US Chicanx origins of the terms *joto* and *jotería*, other Latinx folks sometimes feel excluded by the nomenclature, but this is changing as people engage with it and as the field decolonizes and becomes more inclusive. It is hard to pinpoint an exact year when the field of jotería studies was created, given the long trajectory of queer Chicanx and Latinx folks engaged in scholarship and cultural production. However, the development of the Association for Jotería Arts, Activism, and Scholarship (AJAAS) in 2011, its first conference in 2012, and the publication of a special issue of *Aztlán* on jotería studies in 2014 were critical, formative events in the growth of the field.

**Resignification of Jotería**
Daniel Enrique Pérez argues that jotería studies “can be considered a critical site of inquiry that centers on nonheteronormative gender and sexuality as related to mestizo subjectivities” (2014, 144). For Xamuel Bañales, jotería studies is a decolonial project; he argues that contrary to the “reclaiming of fag or other terms like dyke and queer, the resignification of Jotería ... is part of a decolonial collective movement—an emerging political term that challenges Western thought” (2014, 156). The influential Chicana lesbian scholar Gloria Anzaldúa (1942–2004) helped launch the academic usage of the term jotería in her classic work *Borderlands/La Frontera: The New Mestiza* (1987) when she wrote, “People, listen to what your jotería is saying” (85). This widely cited command has been taken seriously by jotería scholars, artists, and activists as confirming that they have something valuable to say and that their experiences need to be heard. Between 1987 and the *Aztlán* special issue in 2014 (the so-called jotería studies dossier), a vibrant body of work was published using the term and helping to form the field. In the dossier, Anita Tijerina Revilla and José Manuel Santillána (2014) outline tenets of jotería identity and consciousness, which include radical queer love, commitment to multidimensional social justice, and rejection of racism and colonization. Francisco J. Galarte, writing about trans inclusion in jotería studies, asserts that “the challenge for jotería studies is to be attentive to the lived realities of trans* Chican@folk and to consider how this can inform and challenge how we understand varying assemblages of race, gender, sexuality, and nation” (2014, 233).

Importantly, not everyone doing queer and trans studies work at the intersection of Chicanx/Latinx studies is comfortable saying they are engaged in jotería studies. In part, this is due to the lack of legibility of the term in mainstream academic circles, including in queer studies. Another reason is that that field is grounded in border consciousness and may be attributed to Mexican or Chicano communities specifically. For some, the use of the pejorative term jotería as a term of empowerment is still a challenge. Although these scholars choose not to use jotería to describe their work, their contributions are part of the intellectual lineage that nonetheless contributes to an understanding of the field.

Jotería studies is a political project and scholarly field vibrantly evolving at the intersection of Chicanx, Latinx, queer of color, and transgender studies concerned with the histories, identities, scholarly works, and artistic and activist practices of queer Chicanx and Latinx people. In the jotería studies dossier, editor Michael Hames-García defines jotería studies as “identifiable but not yet fully formed” (138). This collection of essays put jotería studies on the map and is regarded by scholars and educators as a foundational pedagogical, historical, and theoretical text, containing essays on topics ranging from jotería activism to spirituality, identity, aesthetics, pedagogy, and trans studies. They serve as an entry into the field and leave room for others to continue to define it and reimagine its contours. As Hames-García wrote, the essays in the dossier are “gestures toward elaborating this emergent formation, whatever it might finally become” (2014, 138).
Emergence of Jotería Studies

For many, jotería studies has a longer historical genealogy than one might expect. The field dates back to the early work of gay and lesbian Chicanx artists and activists of the late 1960s, 1970s, and 1980s, as well as Chicana feminists such as Anzaldúa and Cherrie Moraga (1952–), who coedited the landmark anthology *This Bridge Called My Back: Writings by Radical Women of Color* (1981). Certainly, works such as Moraga’s *Loving in the War Years: Lo que nunca pasó por sus labios* (*Loving in the War Years: That which never passed through her lips*; 2000 [1983]), *The Last Generation* (1993), and *Virgins, Guerrillas, and Locas: Gay Latino Men Write about Love* (2001; edited by Jaime Cortez), Tomás Almaguer’s essay “Chicano Men: A Cartography of Homosexual Identity and Behavior,” and fiction by Michael Nava, John Rechy, and Terri de la Peña are part of the legacy of jotería studies, as are women-of-color feminist texts by Audre Lorde, bell hooks, Emma Pérez, Chela Sandoval, and others. Tatiana de la tierra’s poetry, photographs, and editorial work, and Carla Trujillo’s *Chicana Lesbians: The Girls Our Mothers Warned Us About* (1991) and *Living Chicana Theory* (1997) are included among the foundational influences of jotería studies. More recently, queer-of-color theorists, such as Leonel Cantú, José Esteban Muñoz, Horacio N. Roque Ramírez, Juana María Rodríguez, Richard T. Rodríguez, Catrióna Rueda Esquibel, and Rita Urquijo-Ruiz have also contributed to the expanding field. Rigoberto González’s *Butterfly Boy: Memories of a Chicano Mariposa* (2011) is also an influential text. However, it was the publication of the dossier that helped to name, curate, and shape the field, as well as to provide legibility, primarily within the North American academy.

As jotería studies scholars join the faculties in US universities, more students are exposed to the field. Currently, jotería studies is taught in Chicanx, Latinx, and queer studies, sociology, and education courses, to name a few. Students may find an entire undergraduate or graduate course on jotería studies, or instructors who include readings on the syllabi or use a jotería pedagogical approach in their classes at the University of Nevada, Reno; the University of Nevada, Las Vegas; Portland State University; the University of Oregon; Oregon State University; the University of Michigan; the University of California, Davis; the University of California, Santa Barbara; the University of California, San Diego; the University of Minnesota, and some of the California State Universities, among others, where some of the innovators in the field are teaching or in graduate school. Artists and activists are central to jotería studies, as are movements such as the undocuqueer movement, led by a network of queer undocumented immigrant activists fighting for the rights of undocumented youth and their families (*Equality Archive 2018*). The pathbreaking labors of Bamby Salcedo, immigrant and trans rights activist and founder of the TransLatin@Coalition, have been inspirational to jotería studies. Her work has been documented by several jotería studies scholars, and she has led workshops and given keynote speeches at many conferences and symposia. These examples show how intersectionality and coalition building are important to the field. These coalitions were
germinating as early as 2006, when an undergraduate conference called La Jotería was held at the University of California, Los Angeles, organized by queer Chicanx and Latinx students and activists (Santillana 2011). Many of the organizers and attendees have moved on to make important contributions to the field. US-based artists Monica Palacios, Yosimar Reyes, Julio Salgado, Adelina Anthony, Carlos Manuel, and Hector Silva have made important contributions through the provocations in their art and have inspired jotería scholarship on their work. Recent scholarship on jotería studies in mainstream publications includes Alejandro Madrid’s essay about Mexican icon Juan Gabriel in a 2018 issue of *GLQ: A Journal of Lesbian and Gay Studies*, which also includes a poem by Maya Chinchilla, and Ellie Hernández’s essay “Cultura Jotería (Jotería Culture): The Ins and Outs of Latina/o Popular Culture” in *The Routledge Handbook of Latina/o Pop Culture* (2016). Another key text within this developing canon is *Queer in Aztlan: Chicano Male Recollections of Consciousness and Coming Out*, edited by Adelaida del Castillo and Gibrán Güido. Through these interdisciplinary and intersectional projects, jotería studies engages with activism, popular culture, affect, memory, healing, sex positivity, self-care, and spirituality.

Jotería studies is nurtured by its relationship with the AJAAS, which was founded in 2011 after meetings in Berkeley, Las Vegas, and Los Angeles. The founders of jotería studies met at the National Association for Chicana and Chicano Studies (NACCS), a Chicanx professional organization that brings together academics, students, and community members doing scholarship on or for Chicanas/os/xs and Latinas/os/x. The development of AJAAS followed a route similar to that of Mujeres Activas en Letras y Cambio Social (MALCS; Women Active in Letters and Social Change), which broke off from NACCS and created its own organization in 1982. Women and gay/lesbian members of NACCS became frustrated with the lack of representation and a safe space for them to share their work within the organization. The Lesbian Caucus was created in 1990, and in 1993 the Gay Caucus was incorporated into NACCS and became the Joto Caucus two years later. In 2007 the Joto Caucus of the NACCS hosted its first conference at the University of Nevada, Las Vegas, titled Towards a Queer Homeland: Bridging Communities and Resisting Hate. This conference catapulted a critical mass of queer Latinx and Chicanx people into a sequence of organized events (conferences, working meetings, and symposia), including large events at the University of Oregon (2008) and California State University, Los Angeles (2010). At that point many felt it was time to create their own organization, and the AJAAS was established in 2011. In 2012 the first AJAAS conference took place in Albuquerque, New Mexico, followed by conferences in Phoenix in 2014 and Minneapolis in 2017; the next meetings were planned for 2019 in Portland, Oregon, and 2021 in Reno, Nevada.

As AJAAS and jotería studies are symbiotic, the organization and its regional offshoots have engaged in defining, debating, healing, loving, creating space, and being intentional about centering indigeneity and Afrodiasporic and intraethnic alliances. Cross-generational exchanges among artists, scholars, and activists have led to the intersection of activism, solidarity, community, and coalition, taking seriously activism and politics as central to
knowledge production and art practice. These tenets were important in the development of AJAAS but can also be seen as central to jotería studies scholarship. Several scholars in the jotería studies dossier documented their own engagements with and contributions to the burgeoning field of jotería studies. Since then, both jotería studies and AJAAS have flourished in academic and community spaces in the United States, and several scholars identify their work as jotería studies, although the origins of this work predates both the 2014 dossier and the organization. Speaking of the history of the field, Hames-García noted that “jotería studies is not something new. It feels old, continuous with years of organizing, reading, writing, and activism. In another sense, of course, it is new, so I have been trying to put my finger on exactly what is new about it. I think it has to do with its face-to-faceness” (2014, 4).

**Recent Developments**

Jotería studies is continually being shaped by artistic, cultural, political, and scholarly developments. These include art exhibits, films, activist platforms, and college courses on jotería studies, as well as the AJAAS conferences and opportunities for publication. One important advance was the establishment of Kórima Press by poet and activist Lorenzo Herrera y Lozano, one the original founders of the AJAAS. Kórima Press is an independent publisher committed to “queer Chicana and Chicano literary art,” according to its website. Publishing books by Claudia Rodríguez, Maya Chinchilla, Michael Nava, Anel I. Flores, Adelina Anthony, Joe Delgado, Cathy Arellano, and others, Kórima has been a nexus of creativity, organizing book launches and poetry readings across the United States. Its publications serve as an archive of jotería literary innovation and inspire new theorizations and scholarship grounded in the lexicon of jotería studies. These works take an unapologetically introspective approach to identity and cultural production that is attentive to the impacts of colonialism, homonormativity, neoliberalism, and racism. Another literary and artistic endeavor anchored in jotería studies is the Jotería Storytelling Project developed by Ernesto J. Martínez in collaboration with Maya Gonzalez, Adelina Anthony, and other artists (AJAAS 2018).

While not all projects use the term jotería, many explicitly do, and they are guided by the evolving vocabulary and framework jotería studies provides, which allow them to claim identities and epistemologies typically shunned by the more traditional Chicano studies, Latino studies, and queer theory (espoused especially by white academics who remain uncritical of whiteness). Others build on jotería frameworks, developing such new theories as Daniel Enrique Pérez’s “mariposa consciousness” and Roberto Orozco’s “critical race jotería theory.” The voices of queer US Central Americans have also been part of jotería studies, as exemplified by the scholarship of Horacio N. Roque Ramírez, Suyapa Portillo, Raquel Gutierrez, William Calvo-Quirós, and Juan Ríos, and the poetry, performance, and editorial work of Maya Chinchilla, whose poem “Jota Poetics” insinuates jotería as a “home”
Possible Future Directions

The future of jotería studies is generative. As a political project, jotería studies is providing a truly intersectional perspective and making an effort to continuously engage queer, trans, gender-nonconforming, indigenous, Afro diasporic, and immigrant voices and perspectives. Future directions include transnational approaches that cross borders to address LGBTQ culture and politics not only in Mexico but also in other places, such as Panama, Guatemala, and Argentina, for example. Scholars in the fields of linguistics, philosophy, film and media, art history, and higher education are applying jotería studies to their perspectives. For example, Pedro DiPietro studies modes of being “permeated by indigenous cosmologies (Aymara, Quechua, and Nahua), ... [and] the production of queer space by comparing networks of racialized travestis in the Andes to jotería networks in the San Francisco Bay area,” as noted on his faculty webpage (Syracuse University 2018). Furthermore, “travesti and jotería both point to the geopolitical tensions between West and non-West. Latina and Chicana spatial thinking enables the comparative study that DiPietro pursues.” Cristina Serna, a queer Chicana art historian, writes about the cultural, aesthetic, and political practices of feminist and queer artists in twentieth- and twenty-first-century US Latina/o and Latin American social movements. Serna’s work on Mexican lesbian feminist and queer Chicana feminist art highlights the way art has been a medium for activists to engage in transborder dialogue about identity, the border, culture, and social justice (Colgate University 2018). Across the border, Mexico City–based Alexandra Rodríguez de Ruiz is a trans activist who lived for many years in the United States. Her activism and publications about her work are part of the transnational conversation in jotería studies. These are only a few examples of the transnational conversation unfolding and building jotería studies.

Space limitations in this entry do not permit mention of everyone who has contributed to and continues to shape jotería studies through their scholarship, art, and activism. However, this entry should serve as a starting point for students and scholars interested in doing more thorough research on this growing field. Jotería studies needs more and new critical voices at various intersections of identities and experiences, including the transnational connections described above and engagement with transgender voices and experiences. As a field that is still expanding and finding its range of analytical and methodological approaches, jotería studies continues to be shaped by scholars, activists, and artists as they confront the political climate around them. Its newness and indeed its marginal status in the academy allow for a malleability that is exciting, promising, and fruitful.

BIBLIOGRAPHY

A complex Thai term most commonly used to refer to male-bodied individuals who express a feminine gender and seek relations with heterosexually identified male partners.

The Thai term *kathoey* is often translated as third sex (*phet thi-saam*). The label can have negative connotations and should be used with care. The Royal Thai General System would transliterate *kathoey* as “kathoei,” but “kathoey” is common in English academic use. English Romanizations of the term also include *krathoey*, *gatoei*, and *gatuhy*. *Kathoey* is often used synonymously with “ladyboy.” Alternate English translations of *kathoey* are “gay,” “fag,” “sissy,” “queen,” and “transvestite.” In everyday Thai usage, *kathoey* are considered along a continuum of degree rather than as an absolute difference of kind from gay men. Thus, the term includes intersex individuals, postoperative transsexual women, and feminine gay men (*Jackson 2004; Sinnott 2004; Enteen 2009; Chonwilai 2012; Kang 2014*).

Since the 1980s, urban middle-class usage of the term more narrowly referred to trans women or sissies, queens, and other femininely presenting males. In Bangkok the term is rarely used to refer to gay (*maen maen*, masculine gay men), tom (butch lesbians), or trans masc (trans masculine) individuals assigned female at birth. (Note that the term *trans masc* moves away from the “opposite sex” binary indicated by the term *female to male* to a broader range of masculine identifications.) That is, the term references feminine male-bodied individuals (*ork-sao*, “show out their femininity”) or “effeminacy” more broadly (*Kang 2012*). The two defining characteristics of *kathoey* are feminine gender expression and a desire to attract “real” or “normal” (heterosexually identified) male partners. *Kathoey* can also be used to refer to intersex (“hermaphroditic”) individuals who are referred to as *kathoey thae* (real *kathoey*). In rural areas, *kathoey* is still used to refer to any person whose gender and sexuality are not heterosexual male or female.

In Thai, *kathoey* can be used neutrally or pejoratively based on tone and context. In 2010, after an hours-long deliberation, Khreua-khai Pheuan Kathoey Thai (Thai Transgender Alliance, or Thai TGA) decided to use the term in the Thai version of their name. Founding Thai TGA members felt that it was the broadest and most widely recognizable term in reference to trans women and could be given new positive valences, according to
unpublished fieldwork conducted by Dredge Kang in 2010. When in-group, kathoey refer to each other vocatively as whores (e.g., *i-dok*, *i-tua*, *kari*) and *tut* (fag, sissy, queen; thought to derive either from “Tootsie” or the term for “ass”), which sissies and queens also use self-referentially. This would be highly offensive otherwise.

Kathoey also jokingly use the slang *kratiam* (garlic) to refer to each other, because it sounds similar, allowing them to speak openly about a potentially taboo subject in public, and because food is often used as a metaphor for sex. The term *norg-toey* (younger sibling kathoey) and *kathoey-noi* (a little bit kathoey) are endearing and diminutive, and often are used for youth whose gender expansiveness is evident or who exhibit potential signs of becoming kathoey but are not yet transitioning into womanhood or fully realized. Another term that can apply to these individuals is *hua pok* (shaven head or short hair). When not referring to a youth, *hua pok* is generally pejorative, synonymous with *i-aep*, which refers to kathoey who try to pass as men or closeted gay men. Kathoey also dismiss each other with the term *kathoey khwai* (water buffalo kathoey), which suggests unattractive faces, large masculine builds, or old-fashioned and rural styles. Kathoey prefer being called *sao praphet-sorn* (second category woman), especially in the context of beauty pageants, cabaret performances, and entertainment media. *TG* or *sao thi-ji* (transgender woman) is often used in the context of HIV prevention and services, borrowing from the English abbreviation MSM & TG (males who have sex with males as well as trans women) used in global health discourse. The term *phuying kham-phet* (literally, cross-gender woman; transsexual lady) has become popular since 2010 through the advocacy of Nok Yollada and her Samakhom Bukkhon Kham-phet Haeng Prathet (Transsexual Association of Thailand, or Trans Female Association of Thailand). Terms such as *banteut* and *taeo* typically have negative connotations; they are used primarily in writing rather than speech.

**Thai Genderscapes**

Various formulations of the Thai sex/gender system have been proposed in academic and popular literature identifying three to eighteen or more categories ([Morris 1994](#); [Jackson 2000](#)). Thais are often nonconfrontational in interpersonal interactions and provide room for “following one's heart,” but still stress and tacitly enforce compliance to group and social norms. This includes the standardization of morally legitimate genders and their other permutations. Genderscapes focus on the distribution of sex/gender/sexuality forms in the everyday lived experience of gendered worlds as they are conditioned, practiced, and recontextualized by the ever-transforming historical and sociocultural realities of labeling, meaning, and identification in uneven fields of moral evaluation, social legitimacy, and power ([Kang 2014](#)). Genderscapes thus destabilize universalized notions of sexual dimorphism and compulsive heterosexuality through cross-cultural comparison.

Individuals who identify as kathoey express a broad range of gender presentations, which also frequently change over the life course or due to specific circumstances. (For example,
the death of a parent requires ordination as a monk, which includes shaving the head and removing any breast augmentations.) Some kathoey identify themselves via their gender performance of femininity, others via their sexual desires for "real men"; the latter often compels the former. This is common when, for example, the kathoey from the village who moves to the city changes from being kathoey to gay, including “gay king.” There are also regular cases of gay men in the city transitioning to trans women, tom transitioning to trans men, and so on. Clearly, biological differences, categorical labeling, and social institutions play a role in identity formation, but the flexibility of Thai genderscapes allows for a back-and-forth between kathoey and gay or other identities, sometimes repeatedly. While US gender studies academics and LGBT+ activists have promoted ontologically fixed distinctions between gay/lesbian and trans identities, everyday people often think of these identities on a gender continuum. The conflict between the difference in frameworks of academics and activists and of everyday folx (a gender-inclusive version of “folks” used self-referentially within the LGBT+ community) is rarely explored.

In Thailand there is more or less cultural consensus that gender and sexuality are clearly linked, though this connection has been eroding since Thai gay men and lesbians have been deinstitutionalizing heterogender pairings. Heterogender relationship forms, where one partner is masculine and one is feminine, are no longer presumed. Gay king + gay queen and tom + dee have evolved to include both dai mot (versatile gay men), tut lesbian (sissy + sissy), tom gay (tom + tom), and tom gay two way (reciprocal gay tom). There is an ongoing proliferation of new forms (Sinnott 2012; Kang 2014). Kathoey + “real man” has similarly evolved. Kathoey generally consider sexual relationships with each other to be repulsive: homosexual, homogender, “lesbian.” However, this is changing as kathoey are increasingly pairing with and can find romantic or companionate fulfilment with gay, tom, other kathoey, and women. Furthermore, sex and love need not be mutually entangled. Kathoey generally have no qualms about buying sex from men or gay men. But there are more options for kathoey who can also be sao-siap (penetrating or insertive girl), as their versatility expands their potential partnerships.

**History and Culture**

There are various potential sources of kathoeyness in contemporary Thailand, some of which constitute continuities from the past and others that are novel formations or hybridizations. *Kathoey* can also be used to refer to fruit trees that bear no fruit or seedless fruit (e.g., a barren papaya tree or a seedless longan); this is closer to the meaning of *kathoey* as intersex or sterile. The term is thought to originate from Khmer. Others point to the kathoey origin in the mythology of Lanna, now the region of northern Thailand (Costa and Matzner 2007). The Tripitaka, the core religious texts of Theravada Buddhism practiced in Thailand, notes the existence of five sexes, including those we would now consider trans feminine, trans masculine, and nonbinary or intersex (Jackson 1998).
The first historical evidence for the use of the term is in the Three Seals Law of 1805. Kathoey were barred from serving as witnesses in court cases, suggesting that they were untrustworthy or mentally deficient. What a kathoey was, however, remains unclear. In the early twentieth century the Kingdom of Thailand mounted and legalized a highly codified system of modern sex differentiation. In trying to maintain its independence from colonial European powers, Thailand had to recast its purported lack of gender differentiation into sexual dimorphism (man and woman, and only those two) in a manner clearly legible to the West (Van Esterik 2000; Jackson 2003; Loos 2006). The autocolonial governmentality of regulating gender thus provided the basis from which new cross-gender identities could emerge. That is, fixing binary male and female poles created new opportunities for their transgression and made those transgressions hypervisible.

Kathoey, as trans women, have increasingly differentiated themselves from gay men and tom (and vice versa). The term gay (as a noun) entered Thai in the 1960s, tom (from “tomboy”) in the 1970s. While there is little evidence of kathoeyness before this time, since then the concept of the kathoey has drastically changed, partly in relation to these other categories. Additionally, contra prior work in gay and lesbian studies that suggested that trans individuals would be replaced by modern gay and lesbian identities, there has been a simultaneous proliferation of all major categories of gender-variant individuals in Thailand since the 1960s (Jackson 2000). Dennis Altman’s (1996) original “global gays” hypothesis and subsequent modifications, for example, explicitly argue for the coevalness of indigenous forms of homosexuality, problematically including transgenderism and modern gay identity. However, the globalization of modern gay identities diffuses from a US-centric, post-Stonewall origin. Following the denied but presumed teleological categorizations of sexual identities leading to “modern” egalitarian homogender sexuality (Murray 2002), this framework suggests there would be a reduction in the number of gender-transformed, age-graded, and other “traditional” forms of homosexuality as they are transformed by gay and lesbian identities following capitalist economic development (D’Emilio 1983). Globalization and transnational contact is not creating kathoey but precipitating their current form (Jackson 2009).

Contemporary Thais generally believe that being born kathoey in this lifetime is the result of a karmic infraction of adultery, neglecting the rearing of one’s children, or prostitution in a prior life (Jackson 1998). Other etiologies include environmental factors ranging from cold, distant fathers to the overuse of testosterone-blocking plastics (Kang 2012). Thus, people born kathoey are tolerated and pitied because they have already been karmically punished to suffer in this lifetime: being kathoey is not a choice or lifestyle preference but rather attributable to external causes. Kathoey suffer because they cannot reach enlightenment in this gender form. Only men can be enlightened, through monkhood and training. Some Thais also believe that reincarnation as a kathoey will repeat 500 lifetimes before the sin is released.
Kathoey often do not believe in the karmic origins of their transgenderism. Many posit a “born this way” sense of self that does not entail misdeeds in a previous life. Among these individuals, most point to early experiences that demonstrated they were really girls, based on their choice of clothing, toys, friendships, and crushes. Many kathoey positively express physical pleasure and the crystallization of their identities during early childhood or teenage sexual experiences. These experiences, sometimes with peers but typically with older men, would likely be considered child sexual abuse in a Western context, but almost universally, kathoey suggest that they were beneficial rather than detrimental to their sense of personhood. The stories are often framed with the kathoey as the sexual instigator or aggressor, or as otherwise agentive, and they are compared to stories about cisgender (referring to individuals whose gender identity is aligned with their sex assigned at birth) girls who had much less control over their bodies and life situations. This is not to say that such encounters are objectively positive. Those who are psychologically devastated are the least likely to share their stories, so there is likely bias in how these incidents are reported in the literature.

**Sexual and Romantic Relationships**

Besides being karmically bound, the kathoey suffers in this lifetime because s/he will never find true, lasting love as a kathoey. The sexual, romantic, and affectionate partners of kathoey typically are heterosexually identified men. Because kathoey cannot provide biological children, they are doomed to be abandoned for “real women,” because men have three responsibilities: (1) duty to country (military service), religion (ordination as a monk), and king; (2) duty to marry and raise children; and (3) duty to support one's parents, especially in light of the karmic debt to mothers. Though not the same, tom also suffer under the expectation that feminine dee (from “lady”) will ultimately leave them for “real men” (Sinnott 2004). Local men are thought to “resort” to kathoey because they cannot do better; they are stereotyped as incompetent, lazy, and unable to attract a “real woman” (Kang, unpublished fieldnotes 2009; W. Keeler, personal communication, 26 March 2010). Thus, their status is diminished, and they experience courtesy stigma when in public with kathoey partners.

If gender definitions are fluid in Thailand, the definition of sex workers is even more slippery (Cohen 1982). There is little “prostitution” in Thailand, but there is a great deal of patronage, in both local and international sectors. Foreign partners tend to fetishize Thai kathoey. Aside from the desire for an “Oriental” lady, many sex tourists are explicitly looking for a woman with a penis (“chick with dick” or “shemale”). A man can never know if a woman is faking an orgasm, but a kathoey has a visible orgasm—the evidence is palpable. Therefore, in Thai “ladyboy bars,” sex workers are required to be preoperative. Preoperative and postoperative kathoey can also work in “girl bars” or as freelancers on the street. Male sex tourists who are repulsed by the idea of having sex with another “man”
and anxious about accidentally falling for a ladyboy trade tips to identify the signs of a woman being kathoey. Their homosexual anxieties are proof of masculinity. By contrast, about half of foreign men confronted with the situation think of it as local spice, something to try on a trip when locally available.

**Social Roles and Media Representations**

Kathoey are most commonly associated with sex work, entertainment, beauty pageants, hair salons, fashion, food service, and tourism. Although there is high social tolerance for kathoey, they continue to face discrimination, physical violence, and structural impediments to life opportunities, especially in education and employment. Kathoey reverse some of the gender roles associated with women. For example, kathoey typically financially support their male partners, rather than vice versa. Kathoey are also more likely to be of a higher class standing than their male partners—the reverse of hypergamy, the cross-cultural pattern of women marrying men of higher status. Their putative sexual availability and aggressiveness with men also sharply contrasts Thai gender norms, in which young women’s chastity is prized. When young women are sexually unavailable, young men are thought to resort to kathoey or each other. Kathoey are often involved in care chains, having a foreign patron who regularly sends money and occasionally visits (sometimes maintaining more than one patron simultaneously), continuing to have Thai and foreign clients, and “raising” a local Thai “boy.”

Although some kathoey are involved in Hindu, courtly, and local spirit cults, kathoey are generally not thought to be spiritually more connected with the undifferentiated nature of the universe, as trans people are in other parts of Southeast Asia. Rather, being intermediate between males and females, they are able to effectively channel both male and female deities, kings, and spirits. Additionally, because kathoey are not “real men,” they are permeable to possession; men and especially monks are not. Because kathoey are not “real women,” they do not experience the unholy pollution of menstruation. Furthermore, as former men who ordained as monks, they already have accrued a certain degree of religious power. Thus, kathoey and gay men make ideal spirit mediums.

Trans people are regularly represented in the media. Newspapers primarily associate kathoey with sex work and criminality (e.g., stealing money from their clients). Though trans women have been portrayed as comedic or tragic characters in film and television, their roles are expanding to be more common, activist, and diverse. Like Venezuelans who note the “spectacular beauty” of transformistas (*Ochoa 2006*), Thais often express awe and admiration for the (albeit freakish) “over-beauty” of kathoey, claiming that kathoey cabaret performers, beauty pageant contestants, models, and actors possess corporeal characteristics unattainable by “real” women. Kathoey cosmetic surgery and self-transformation are often valorized instead of stigmatized. Therefore, bodily feminization practices and gender transition in general can be very positive experiences for kathoey, but
more so if they are considered beautiful and do not have the stereotypical impediments of a Chinese father or Muslim community.

One reason foreigners believe kathoey are more accepted in Thailand than they are is because of the media that circulates internationally and is subtitled (Kang 2011). Popular Thai overseas films such as Iron Ladies (2000; Thai title, Satrie lek) and Beautiful Boxer (2004) provide positive affective associations with trans identities. However, the majority of portrayals in Thai films that never get exported, such as Hor taew tak (2007; Haunting me) and Dtaew dte dteen ra-bert (2009; Sassy player), would offend the same audiences. What appears “amazing” to the foreign gaze is often read as amusing, strangely titillating, or abnormally perverted by locals. This has been exacerbated by recent trends in K-pop cover dancing among sissies. The cover group Wonder Gay, for example, was held up by elite commentators as a contagious model promoting lack of genuine masculinity, developmental backwardness, and Korean influence among Thai youth.

**Medical and Legal Issues**

High social tolerance for kathoey does not mean there is no stigma or discrimination. This is especially true for kathoey who are not beautiful and do not pass as cisgender women. The most common complaint among trans and gender-expansive femme individuals in Thailand is that they are not able to find a “husband” (pua). Second, if they have difficulty with their families, they want to improve relations. Third, they want to make changes to their birth certificates, national identification cards, passports, and other legal documents, which in Thailand is not allowed, even after gender surgery.

For kathoey, this means that they have difficulties with safe feminization practices and tenuous access to professional health care, greater social vulnerability to partner violence and HIV infection, higher rates of substance misuse (e.g., methamphetamines), and exposure to invasive bodily searches and sexual harassment during international travel. In addition, they cannot legally marry a partner of the “same sex” or adopt children. The list of policy-level assaults is extensive. Well-documented cases include the 1997 attempt by the Rajabhat Institute (national system of teacher colleges) to prohibit “sexually deviant” individuals from admission, and a 2000 government public relations department request for television producers to limit portrayals of the “third sex.”

Older kathoey are rarely publicly visible. There are various theories to explain this, including that they die young from HIV, violence, drug abuse, or feminization procedures gone awry, or that they are unable to maintain their beauty and therefore revert to living as cisgender men of various sexual orientations. It is important not to stereotype kathoey as sex workers but also to be cognizant that sex work is a common profession among kathoey, in part because of the discrimination they experience in legal employment. About half of kathoey engage in regular sex work. In Bangkok Thai settings, kathoey can charge 100 Thai
baht (THB) (about $3 in 2018) for a quickie hand job or blow job on-site or 500 to 700 THB for service that occurs in a short-term hotel room. Rates for foreigners are more likely to be 1,000 to 1,500 THB for “short time” and 2,000 to 2,500 THB for “all night.” In high tourist areas, police harassment is heightened for kathoey. A kathoey can be arrested simply for being with a Caucasian man, which implicates the couple in sex tourism; the partner is evidence of sex work, as are any condoms s/he is carrying. Kathoey are refused admission to some nightclubs and hotels following the same rationale, to prevent sex workers from doing business on the premises. There is, however, increasing human rights activism and specialized services, such as Munnithi Sittoe (Sisters Foundation) in Pattaya and Sun Thaenchoerin (Tangerine Community Health Center) in Bangkok.

Human rights and policy reforms for kathoey have broad support among LGBT activists in Thailand. Unlike in other parts of the world where trans women were a later addition to lesbian and gay movements, in Thailand kathoey and tom have been central to and actively involved in what is referred to as “sexual diversity” movements; that is, kathoey do not have to be “included” because their perspectives and participation are expected. There have been many legal battles initiated by kathoey and many have been successful, often to the surprise of both local Thais and foreign observers. One of the most publicized involved the 2011 revision of the language that exempted trans women from mandatory military service. Previously, trans women who were conscripted via the lottery system were exempted due to “permanent and severe mental illness,” which made it difficult for kathoey to secure employment because job applicants are required to submit their military service documentation. (Alternatively, kathoey who were on hormones or who had breast augmentation surgery were exempted for having a “deformed chest.”) After the court ruling, the exemption language was softened to the less stigmatizing “gender does not correspond to sex at birth.” Implementation of the policy has been uneven, but it is improving. Trans rights are increasingly being taken up by the courts and garnering broader support among legislators.

BIBLIOGRAPHY

The presence of homosexuality and gender variance in the traditional cultures of the peoples of Kenya can be difficult to trace. The fluidity of the largely oral tradition of Kenya's precolonial culture makes it notoriously unreliable as a source of information on topics as charged as sexual orientation, particularly after coming under the influence of Kenya's dominant religions of Islam and Christianity. Yet it is still possible to find remnants of traditional artifacts that reference homoeroticism and gender variance.

**Sociocultural Context**

Oral literature cannot be studied and analyzed meaningfully outside the sociocultural forces of the society that created it. This limits an individual's ability to write about traditional “Kenyan” cultural understanding on any subject. One may be lucky to establish dominant themes emerging from the forty-two ethnic groups in Kenya, but there will always be nuances and intimate details to any cultural practice that are understood only by the insiders of any one of those cultural practices or worldviews. As such then, the value of the cultural remnants described below may very well be limited to the Kikuyu, the best-documented and historically influential ethnic identity. There are precious few historical writings in Kenya today that speak of homoeroticism or gender variance without ascribing a pseudo-African-Christian/Islamic value judgment at the same time. Themes that emerge range from viewing homoeroticism as something experimental or strictly juvenile to being pseudo-spiritual or a curse. Gender variance is also contextualized within the realm of the spiritual and to be feared. The following are some contextual themes that are important in understanding homoerotic and gender variance in Kenya.

**Homosexuality as a Juvenile Activity** Jomo Kenyatta, with his book *Facing Mount Kenya* ([1938] 1965), became perhaps the first indigenous Kenyan author to write on this subject without overmoralizing it. He casts sexual activity as being highly regulated, but even within this restrictive environment there were socially allowed pressure valves for sexual release. For example, before initiation into adulthood, “it is considered right and proper for boys to practice masturbation as a preparation for their future sexual activities. Sometimes two or more boys compete in this, to see which can show himself more active than the rest”
Competitive masturbation would probably not fit into the modern homoerotic practice of mutual masturbation among self-identifying gay men. One must be careful not to impose a contemporary narrative, especially because masturbation was considered very wrong for girls of a similar age. Indeed, even boys were supposed to outgrow this practice after initiation into adulthood. Others have ascribed homosexuality to juvenile acts that result from hormonal changes during adolescence.

**Heterosexuality as the Normative Behavior** Kenyatta also notes that given the freedom for heterosexual intercourse between young people of opposite sex, homoeroticism was irrelevant. One would therefore contextualize this reasoning to the lack of visibility of minority populations in any meaningful or culturally significant way, especially in the context of a conformist culture. It is therefore hard to find any legacy of minority narratives of homoerotic relationships and/or gender variance. Conformism is itself situated within a metaphysical and deontological (rules- or duty-based ethical) worldview, one featuring benevolent and malevolent spirits and ancestors, who have the ability to cause diseases and other calamities. As Michael T. Katola noted in a 2014 article, children were taught that they do not live alone, and they were therefore required to conform to the social norms and obligations. Death and calamity were seen to result from diversion from the established social order. Individuals operating outside the social norm were seen to be a threat not only to themselves but also to the society as a whole. This had a powerful effect not just of repressing potentially dangerous behaviors but also of silencing knowledge of their existence or encouraging people to avert their eyes from such behavior.

**Gender-Bending Mythical Stories and Proverbs** Myths about the changing of gender are quite common in many African communities in Kenya. Among the Kikuyu, for example, walking around the Mugumo tree seven times would lead one to change one's gender from female to male or vice versa. The Mugumo tree was a sacred place of worship for the Kikuyu, and it is not clear whether this myth was meant to dissuade sacrilege or to emphasize the magical powers associated with the sacred place. At any rate, the very idea of gender change demonstrates that the Kikuyu did not necessarily think of gender as immutable—that change could indeed be countenanced. Yet while one has to be careful not to impose a contemporary understanding of transgender rights to a different cultural milieu, the centrality of the Mugumo tree in the spirituality of this community should not be discounted. Among the Kamba, the Kituluni Hills are respected as sacred. Although the phenomenon that made them respected is now scientifically understood as that of a so-called gravity hill (where, for example, water appears to run uphill as a result of an optical illusion), it is believed that anyone who wanted to change his or her gender needed only to walk around the Kituluni Hills seven times.

**Sex and Sexuality Not Viewed as Moral Issue** Many communities in Kenya did not see sex and sexuality as a moral issue, a view that changed with attempts to normalize African sexuality and make it consistent with a Christian worldview. John S. Mbiti (1990), regarded
as the father of contemporary African theology, stated that sexual activity is a ritual with spiritual value for Africans—hence not at odds with Christian morality. Sexual practice was highly regulated and understood within the context of childbearing and family structure, as well as a community sense of internal and external security. Sexual pleasure per se was not viewed from a puritanical perspective but rather in relation to the risk of premarital pregnancy. Indeed, sexual pleasure that did not lead to pregnancy and did not otherwise enter the realm of public discourse was even encouraged, something that would not happen in the overly moralized view of sexuality in the twenty-first century.

**Religious and Legal Discrimination**

Islam entered the coastal region of Mombasa in the tenth century but did not spread to the interior until the advent of colonial occupation, particularly with the building of the East African Railway line in 1895. The presence of modern Christianity in Kenya can be traced to 1844. According to 2009 census data, about 48 percent of Kenyans have a Protestant affiliation, 24 percent report a Catholic affiliation, and about 11 percent report Muslim. Only 2 percent of Kenyans reported having no religion. The sacred writings of both Islam and Christianity have been widely interpreted to condemn same-sex relations as contrary to the will of God, leading to widespread discrimination against any person who engages in nonheterosexual relations. Under these powerful religious influences, traditional perspectives of homoerotic relationships and gender variance became extremely moralized, and the notion of same-sex sexuality as being contrary to Kenyan religious practices and sensitivities is all too common. The contemporary moralization of homoerotic relationships and gender variance would not be problematic if it were not cast as an accurate reflection of African character and as the normative position. Theology of inculturation posits African culture as primarily Christian in essence. Renowned African theologians of inculturation posit Jesus Christ as the *Nana* (ancestor) or as the *Muthamaki* (ideal elder).

The criminalization of homosexuality in Kenya is rooted in the legacy of colonization. A 2008 report by Human Rights Watch titled *This Alien Legacy: The Origins of “Sodomy” Laws in British Colonialism* provides an insightful perspective on how the British law criminalizing homosexuality, first introduced in India in 1890, became a model that spread to other colonies in Africa—first in Nigeria then to Kenya just before independence in 1963. Therefore, contemporary gender and sexual minority tensions in the society are contextualized within a colonial and postcolonial codification of the normative social order, enforced through legal and political organizing structures that are alien to precolonial African traditions.

The modern LGBTQ community in Kenya faces significant discrimination, both legal and social, as is the case throughout the African continent. According to a 2013 survey by the Pew Research Center, close to 90 percent of Kenyans do not accept homosexuality; LGBTQ
individuals in Kenya who come out, or are outed by others, are frequently disowned by their families, lose their jobs, or face ridicule and physical violence because of their orientation, according to a 2011 report by the Kenya Human Rights Commission. Beyond the social stigma, those in the LGBTQ community can face up to fourteen years in prison for “carnal knowledge of any person against the order of nature,” according to the Kenyan penal code, making homosexual acts a criminal offense.

HIV and AIDS

There is no denying that HIV and AIDS have disrupted the discourse on sexuality in Kenya immensely. There has been an explosion of research in the area of sexuality in the twenty-first century. The first systematic study of homosexual men in Kenya happened in 2005, and among its main findings was that the number of homosexual men in Nairobi was not negligible (Onyango-Ouma, Birungi, and Geibel 2005). After years of neglect in the provision of HIV services (ostensibly because homosexuality does not exist in the country), the government with the urging of international donors undertook a “know your epidemics” study that demonstrated that male-to-male sexual transmission of HIV in Kenya was a significant contributor to the national epidemic (Mbote et al. 2016). Even though homosexuality remains criminalized, the government and gay community groups have
been working together to address the epidemic.

**The LGBTQ Rights Movement**

Although primarily in major urban areas, there are vibrant LGBTQ groups to be found in every part of the country, with the Gay and Lesbian Coalition of Kenya (GALCK) being the main umbrella body that brings the groups together to form a national agenda. The oldest group, Ishtar-MSM, was founded in 1997, while GALCK was established in 2006. In almost every main urban center in Kenya today there exists an LGBTI group though not always a formally organized one (Mbote et al. 2016).

There is also evidence that LGBTQ rights activists in Kenya are gaining ground. In 2009, for example, two Kenyan men got married as what appeared to be loving, equal partners in London, which created a huge cultural shock in Kenya, typically expressed as outrage. Five years later, one of Kenya’s most internationally recognized authors came out as gay. Binyavanga Wainaina’s declaration was met mostly with apathy in the local press and “broadly sympathetic” coverage in the serious press around the continent (Adams 2014).

Meanwhile, the country's constitution, enacted in 2010, enshrined the values of equality, dignity, and freedom. Although no explicit reference to sexual orientation or gender identity was made, the attorney general committed to passing equality legislation that includes gender identity and sexual orientation by 2022. Transgender rights activists have been more active in using the court system to gain their rights. In 2016 Transgender Education and Advocacy became the first transgender-identified organization to be registered in Africa. In 2015 the High Court of Kenya ordered the registration of the National Gay and Lesbian Human Rights Commission by the Non-governmental Organizations Coordination Board. The board subsequently appealed this ruling.

The current criminalization and overmoralization of homoeroticism and gender variance represent an incomplete decolonization enterprise. Ngũgĩ wa Thiong’o, a prominent postcolonial author from Kenya, writes of the need to decolonize the mind in his 1986 book *Decolonising the Mind: The Politics of Language in African Literature*, but Kenyans and Africans need to do much more than deconstruct the colonial legacy in the mind. The criminalization of homoeroticism and gender variance in accordance with British colonial law and non-indigenous African religions could be seen as an example par excellence of contemporary voluntary collaboration with the masters of the colonial enterprise. If African collaborators were to be seen as the nexus between the colonizers and the colonized before independence (Wamagatta 2008), then the current supporters of the British colonial law on the basis of its opposition to homosexuality may be seen as the neo-collaborators perpetuating a British legacy that the British themselves have since abandoned or reformed.

BIBLIOGRAPHY

Khookha McQueer is a Tunisian digital artist, performer, and genderqueer person. In their youth, Khookha came out as a gay man, using their birth name, Khalil Ayari. In 2015 they came out a second time as genderqueer and began using the English personal gender pronouns they/them/their {along with their chosen name, Khookha McQueer}. However, they still maintain some online platforms under Ayari, the name they first used for their artwork. (Their birth name is used here with their permission.) Khookha began their career as a graphic designer, explaining that “at first I was not considering myself making art or producing anything related to art,” but that “it started … during the most oppressive moments in my life, at some points in my life I was not able to externalize my thoughts and feelings through speaking and saying things about my preferences, orientation and gender identity clearly” (Khookha McQueer 2017d).

With their digital artwork, Khookha resists a state apparatus that denies them their subjectivity and sexual autonomy as a nonheterosexual person. Khookha uses almost exclusively digital platforms such as Facebook and Instagram, a progression of their early career as a graphic designer. Furthermore, as a genderqueer person, they experience cis-sexism. Genderqueer and transgender individuals in Tunisia, as is the case globally, are subject to violence and hate not only from heteronormative society but also from less tolerant members of lesbian, gay, bisexual, transgender, queer, intersex, and other marginal sexualities (LGBTQI++) communities. Khookha’s images present opportunities for small shifts in perception that, compounded, may eventually contribute to a less oppressive Tunisia; the mere representation of gender variation challenges viewers to engage with difference. Khookha also strengthens the development of queer and queerness as political-sexual positions by making visible a queer Tunisian politic that resonates with other queer-identified individuals, specifically genderqueer, transgender, and gender-nonconforming people. In doing so, Khookha addresses both the erasure of these individuals from LGBTQI++ communities and the violence perpetrated against them.

**The Tunisian Context**

Heteronormativity, homophobia, and patriarchy are embedded in Tunisia's social
framework, and LGBTQI++ people often experience sexual policing both in public and from their family members. They even risk imprisonment. A 2017 stakeholders report from the Tunisian Coalition for the Rights of LGBTQI People cites multiple incidents of discrimination and violence against LGBTQI++ Tunisians, such as beatings, arrests, detainment, and the Tunisian state’s attempts to prove the occurrence of anal penetration through the abusive practice of anal testing. Khookha, once beaten as a teenager, is no exception and still experiences harassment and hate speech in public and in the digital forums where they show their work (Khookha McQueer 2017a).

Before the 2011 Tunisian revolution that ousted Zine El Abidine Ben Ali from the presidency, the LGBTQI++ community was underground, using coded profiles and message boards to find one another and to organize (Khookha McQueer 2017a). Now, organizations can be more visible and speak out against oppression, both in public forums and online. Yet Article 230 of the penal code, which criminalizes “homosexual or lesbian acts” (quoted in Farchichi and Saghiyeh 2009, 8), continues to present obstacles to the LGBTQI++ community. While the new Tunisian constitution of January 2014 represents significant improvements with regard to the rights and personal freedoms of all citizens, the Tunisian penal code was not revised and remains in direct conflict with many provisions of the constitution.

Although Article 230 is most often applied, Article 226, a morality clause, can be used to criminalize an individual who “displays bawdy [sic] on purpose” and, according to 226a, to “those who publically violates [sic] good morality and public decency by signs or words” (quoted in Farchichi and Saghiyeh 2009, 14). Ali Bousselmi, from the Tunisian LGBTQI++ rights group Mawjoudin We Exist, has explained that Article 226 is often used against transgender people (Bousselmi 2017). Another Tunisian LGBTQI++ activist, Ramy Ayari, articulates that transphobia exists within the LGBTQI++ community and that he “knows certain people who did not like Khookha’s images” (Ayari 2017). Groups such as Shams, for example, perhaps choose to highlight Article 230 because gay men are arrested and prosecuted more often than transgender people (Bousselmi 2017). Thus, transgender and genderqueer people are often not represented in Tunisian LGBTQI++ visibility. The subtle erasure of the transgender population illustrates what Bousselmi calls “a lack of conscience and engagement with regards to transgender people, who remain in the [social] margins” (Bousselmi 2017). Furthermore, the social hierarchy of men who have sex with men is strict. According to Khookha, “tops are not systematically considered gays by society,” but men who receive penetration are stigmatized, as are “feminine boys [who are] subjected to discrimination and oppression within the community too” (Khookha McQueer 2017a, 2017b).

Yet Khookha’s relationship with the community is not antagonistic; rather, they are part of an effort to move toward more inclusive, fluid, and queer concepts of gender and sexuality. They pressed to add Q, I, and ++ to the LGBT initialism in Tunisia and have also been part of
public service announcement–style videos for the advocacy groups Where Love Is Illegal and M-Coalition. When Khookha uses the word *queer*, they mean that they do not want to be attached to an identity that has particular sexual acts and preferences already ascribed to it (*Khookha McQueer 2016*). Instead, Khookha wants to open up new possibilities for sexuality: the range of acts, sentiments, desires, and possibilities that make up a variety of human social interactions (*Weeks 2009*). Khookha’s images thus address a gap in advocacy for and representation of cross-dressing, transgender, and genderqueer individuals.

**Hairy Breast**

Two digital images by Khookha, *Hairy Breast* (*2016*) and *Znous 2* (*2016*), demonstrate how they use themes of masculinity and femininity to expose social constructions of gender and to express fluidity in gender and sexuality. In *Hairy Breast*, masculine and feminine elements coexist in order to disrupt the sex and gender binaries, critiquing how categories of man, woman, gay, lesbian, or straight, for example, are mapped onto gender presentation. While, globally, contemporary art that tackles issues of gender and sexuality often deploys similar strategies, here these elements disrupt the gender essentialism implied by Article 226 and upheld by aspects of the LGBTQI++ community.

![Hairy Breast](image)

**IMAGE COURTESY OF KHOOKHA MCQUEER**

*Hairy Breast (2016) by Khookha McQueer.* In *Hairy Breast*, masculine and feminine elements are shown as coexisting in order to disrupt the sex and gender binaries, critiquing how categories of man, woman, gay, lesbian, or straight, for example, become mapped onto gender presentation.

By creating visual space for effeminate expression, Khookha attempts to counter some of the hypermasculinity and transphobia they perceive within the LGBTQI++ community (*Khookha McQueer 2016*). In *Hairy Breast*, a corseted chest fills the frame, and two hands appear at the edges with fingers spread wide across the pectoral muscles; short, unpainted nails punctuate the fingertips. Because of the close cropping of the image, it is unclear
whether the hands are pushing the muscles together to create roundness or merely to display the chest. The subject’s fingers rest on both the corset and the chest, spread across as if linking the two incongruous elements. These ambiguous elements therefore prevent the projection of gendered expectations onto this body, refuting the violence of gendering experienced by Khookha and others in Tunisia. Tension is evoked with the possibility that the hands could be connoting the desire of embrace or pulling the gendered body apart in self-hatred and discomfort. Khookha’s image embodies the conflicting feelings many people of marginal sexuality experience, where self-affirmation and disgust are in delicate balance.

Znous 2

Like Hairy Breast, Znous 2 highlights gender nonconformity with a portrait of Aya, a young genderqueer Tunisian. The image is part of an ongoing series that documents queer and gender-nonconforming individuals in Tunisia. Aya’s chechia (a distinctive red wool cap), moustache, and cigarette are purposefully styled as markers of Tunisian cultural masculinity. The well-groomed moustache has long been a symbol of Arab male dignity and honor (Daoud 2000), while the chechia is a traditional Tunisian men’s garment. Although uncommon for young men today, it references a deep cultural masculinity (Spring and Hudson 2004). Thus, for Aya to both wear the chechia and sport a moustache symbolizes their claim of masculine identity in the cultural context of Tunisia. The cigarette serves a similar function. In Tunisia, it is still taboo for women to smoke. For boys and men, however, smoking is almost a right of manhood (Ben Romdhane 2017). The hand gesture in particular indicates that Aya uses this prop to perform Tunisian masculinity; holding the cigarette with thumb and forefinger signals a masculine assertiveness, “the way macho man hold the cigarette to show their manly attitude [sic]” (Khookha McQueer 2017d).

For Khookha, the most important aspects of their art are that it is deployed as a visual engagement and collaboration with the Tunisian LGBTQI++ community, as well as a means by which to challenge perceptions of gender in Tunisia (Khookha McQueer 2016). In Znous 2, Khookha demonstrates the existence of queer and non-conforming individuals in Tunisia to different audiences: Tunisians, non-Tunisians, and also the LGBTQI++ community in Tunisia. There are several pronounced cues that locate the photograph in Tunisia, the most immediately recognizable of which is the bright blue door: “The subject in Znous clearly stands in front of a door in the street of the conservative sphere of the Medina of Tunis” (Khookha McQueer 2017d). Written on the door in Arabic are the words “for rent,” a background that Khookha chose in order to complicate the idea of personal rights and freedoms in Tunisia, where women and LGBTQI++ individuals often experience contradictions between self-fulfillment, state laws, social regulations, and family expectations. The “conservative” medina featured behind a genderqueer individual highlights these contrasts (Khookha McQueer 2017e). Khookha therefore visualizes a precise geopolitical location, asking viewers to recognize the presence of gender boundary-blurring individuals in Tunisia.
Despite the inhospitable social climate, Khookha is in fact opening up space for queer possibility within Tunisia; they do not want to leave Tunisia, disown their heritage, or espouse a one-sided and negative attitude about oppression in their locale. Instead, they propose that queerness and Tunisianness are not mutually exclusive. While viewers may dislike the image’s content, Aya’s presentation and the geographical marker that serves as their background locate them indisputably in a particular cultural and geographic space. Furthermore, Khookha articulates that they perceive a disconnection between the Tunisian LGBTQI++ community and the global queer community; they feel isolated from contemporary conversations and issues (Khookha McQueer 2017a). The keffiyeh, a scarf most commonly associated with Palestinian resistance, perhaps then indicates the potential for solidarity with oppressed populations across the Arab world.

Finally, Khookha titled the series Znous, an Arabic word that they repurpose to indicate multiplicity of gender. Khookha explains that “the expansive plural of jens (sex), which is jounouss, is never used to describe human sexes.... Jounouss is the Arabic root of the word znous (and) znous is also meant to say and to be understood in other Arab countries as multiple sexes and genders.” In a play on Arabic language, Khookha references jounouss—used as “janous” in the Persian Gulf region to, for example, humiliate gender-nonconforming people—and recuperates the slur to highlight the diversity of gender expression in Tunisia (Khookha McQueer 2017c).

**The Importance of Digital Spaces**

Khookha’s use of digital spaces means that their work reaches a much larger audience than,
for example, art displayed at Tunisian galleries. They intentionally use this broad platform to make political statements, expressing that “after my second coming out as a genderqueer individual I took my social media expression to a new level, clearly promoting bodily rights, genderlessness and queerness” (Khookha McQueer 2017d). While the anonymity of the internet often exposes Khookha to hate speech, they explain that for these two images “the reactions both on media and outside the media varied, [but] over all the comments were majorly positive, [and] most of the people who saw the work understood the main message,” and that “the most shocking comment I got about [Znous 2] came from an administration agent … [who] works in [an] artistic and cultural organization [who] said that I may represent a harm for the community as my work is disadvantaging the LGBTQI+ cause” (Khookha McQueer 2017e). The agent’s reaction is one example of the cultural inflexibility described by Khookha and found throughout heteronormative, artistic, and LGBTQI++ communities.

Khookha illustrates the complexities of gender and sexuality for the Tunisian context within which they work and live. They are an instrumental part of the small, but active, Tunisian LGBTQI++ community making its mark on the country, and although they sometimes face resistance from within the community itself, Khookha continues to combat the erasure of, and violence against, cross-dressing, transgender issues, and queerness, visualizing a multiplicity of gender expressions in Tunisia.

In 1940 the biologist and sex researcher Alfred C. Kinsey (1894–1956) created the Kinsey scale. This metric, also known as the 0–6 scale or heterosexuality–homosexuality scale, was first published in Kinsey’s coauthored book *Sexual Behavior in the Human Male* (1948; hereafter *Male* volume) and reprinted with additional discussion in the succeeding volume, *Sexual Behavior in the Human Female* (1953; hereafter *Female* volume). The Kinsey scale is a visual representation of human sexual behavior, desire, and fantasy on a seven-point band from zero (wholly heterosexual) to six (wholly homosexual). It also has a separate X category for those who have no sexual experience or attractions at all. Since its initial publication, the Kinsey scale has served as a tool for self-knowledge and a representation of the broader concept that human sexuality exists on a spectrum. It remains a popular instrument for people who want to consider their sexual identity in a numerical form without using the words *heterosexual*, *bisexual*, or *homosexual*.

**History and Context of the Scale**

American social and human scientists in the 1920s and 1930s gradually turned to quantitative methods from the more qualitative research methods that were popular during the previous two decades. Researchers focusing on sex and reproduction—including Robert Latou Dickinson, Katharine Bement Davis, Carney Landis, and Hannah M. Stone—used the titles of their books to announce specifically the number of subjects they studied. Kinsey, who had collected more than 6 million individual galls and gall wasps during his entomological research in the 1920s and 1930s, also believed that collecting and analyzing large samples of biological data were marks of scientific precision. After teaching sex education to biology pedagogy students and reading widely across sex-related literatures, he turned his interest in gathering mass quantities of data from insects to human sexual behavior. Beginning in the summer of 1938, he began leading a marriage course at Indiana University, Bloomington, and collecting data in voluntary private interview sessions from the students, faculty, and faculty spouses who attended the course. The marriage course grew rapidly in popularity among students, largely because of the explicitness of Kinsey’s lectures, and Kinsey encouraged course participants to tell him...
their sex histories in private interviews. The course and the interviews together inspired him to start interviewing people across Indiana and Illinois, particularly members of homosexual communities.

After hostility from the university's medical staff forced Kinsey to terminate the marriage course following its seventh iteration in August 1940, he turned to sex research full time. He developed a standardized interview method, hired staff, and used punched-card machine technology to organize the ever-growing amount of interview data. That September, he wrote a letter to Glenn V. Ramsey, a former marriage course participant and an Indiana University graduate student in education. Ramsey found in his own research with adolescent boys in Peoria, Illinois, that approximately one-third of them engaged in same-sex sexual behavior. Kinsey compared Ramsey's research to his own findings, and in the letter, he described a new numerical method that represented ranges of sexual behavior and that decoupled behavior and desire from the identity categories “homosexual” and “heterosexual.” He also included a drawing of a scale that depicted the method graphically. The original drawing is no longer extant, but Kinsey's textual description resembles the scale printed in both volumes.

![Figure 161. Heterosexual-homosexual rating scale](image)

Based on both psychologic reactions and overt experience, individuals rate as follows:

0. Exclusively heterosexual with no homosexual
1. Predominantly heterosexual, only incidentally homosexual
2. Predominantly heterosexual, but more than incidentally homosexual
3. Equally heterosexual and homosexual
4. Predominantly homosexual, but more than incidentally heterosexual
5. Predominantly homosexual, but incidentally heterosexual
6. Exclusively homosexual
After the creation of the scale and Kinsey’s decision to include it in the standard sex history interview process, Kinsey and his interview staff showed it to interviewees and asked them to select a number that most clearly represented their sexual self-perception on the scale. The interviewer would also include his own observation of the interviewee's scale number on the interview sheet if there was a difference. The interviewer's selected number was then included into the interviewee's data set and integrated into the mass data set generated for the Male and Female volumes (Weinrich 2014). The Male volume was published in January 1948, and the chapter on homosexuality in particular drew immediate wide attention for the large percentages of men across educational, age, and social levels who reported having same-sex sexual arousal and contact to orgasm.

The Scale in the Male Volume

The Male volume compiled data from 5,300 white American men, including men who had served or were serving prison time, and the 0–6 scale appeared in the volume’s “Homosexual Outlet” chapter. Kinsey and his coauthors described the scale as a continuum, pointing out that human sexual behavior, desire, and fantasy rarely fell into simplistic black-and-white categories that contemporary law, medicine, and religion and broader American society established and enforced. An individual could be placed anywhere on the scale, and any measurement device for human sexual behavior needed to reflect such diversity: “It is a fundamental of taxonomy that nature rarely deals with discrete categories.... The living world is a continuum in each and every one of its aspects. The sooner we learn this concerning human sexual behavior the sooner we shall reach a sound understanding of the realities of sex” (Kinsey, Pomeroy, and Martin 1948, 639). The most accurate representation of an individual’s sexual experience, then, would be based on the relative amounts of heterosexual and homosexual experiences in that person's history. Depending on age, social class, marital status, and educational level, between 80 and 97 percent of men were classified as 0s on the scale and the remainder as 1s through 6s. The population with the greatest amount of 1s through 6s was single men with no more than a high school education (Kinsey, Pomeroy, and Martin 1948). Forty-six percent of all men interviewed had experienced some sexual arousal toward other men, and 37 percent had experienced at least one homosexual contact that led to orgasm.

Furthermore, Kinsey and his coauthors argued in both volumes that the scale should be used as scientific evidence that the word homosexual and its many slang variations should be used only to describe certain types of encounters and fantasies, not persons. For example, it was common in the 1940s to consider a man “passively” receiving oral sex from another man as heterosexual and consider only the man “actively” giving oral sex as
homosexual. Because same-sex sexual encounters were illegal across the United States at the time, Kinsey and his team argued that homosexual behavior should be legalized given their evidence. Sexual identities could then be destigmatized by omitting the identity terms *homosexual*, *bisexual*, and *heterosexual* and replacing them with the scale numbers. While this latter idea never took hold broadly, references to being a “Kinsey [number]” or statements that “[this celebrity] raises my Kinsey number from a [2 to a 3]” are common on websites with content in American English related to gender, sex, and pop culture.

**The Scale in the Female Volume**

The authors repeated some of their arguments regarding the 0–6 scale in the *Female* volume when it was published in August 1953. The *Female* volume contained the histories of 5,940 white American women, none of whom had served prison time. According to Kinsey and his colleagues, women had combinations of homosexual experiences at three different levels of arousal, which marked their placement across the 0–6 scale. The authors tracked three types of experience separately: psychological sexual arousal with a same-sex partner or through fantasy, same-sex physical experience without orgasm, and same-sex physical experience to orgasm. By age forty-five, up to 36 percent of women had experienced arousal with a same-sex partner or through fantasy, up to 27 percent had had homosexual experience without orgasm, and up to 19 percent had had homosexual contact to orgasm (Kinsey et al. 1953). Between 11 and 20 percent of unmarried women and 8 to 10 percent of married women were rated 1s between twenty and thirty-five years of age; between 3 and 8 percent of unmarried women and under 1 percent of married women were rated 3s at those ages; and between 1 and 3 percent of unmarried women and less than 0.03 percent of married women were rated 6s at those ages (Kinsey et al. 1953).

The *Female* volume contained a more detailed explanation of the X category because it had a greater importance in women's sexual histories than it did in men's histories. In the *Male* volume, the X category—which was not included in the 0–6 scale graphic—was limited to male children and adolescents who had not yet had their first orgasm and a handful of adult men who “have no socio-sexual contacts or reactions” (Kinsey, Pomeroy, and Martin 1948, 656). The *Female* volume identified those in the X category more specifically as people who “do not respond erotically to either heterosexual or homosexual stimuli, and do not have overt physical contacts with individuals of either sex in which there is evidence of any response” (Kinsey et al. 1953, 472). Twenty-two percent of single women who had reached thirty-seven years of age were labeled as Xs, as were 2 percent of forty-year-old married women and 10 percent of previously married (widowed or divorced) forty-year-old women (Kinsey et al. 1953). On the whole, the Kinsey Reports found that while women were more likely to be Xs, some of the individual women interviewed had a much wider range of sexual experiences than most men did.
The Kinsey Reports in US Politics

While the Kinsey Reports generated thousands of responses in the press, academia, and professional circles, as well as among the public, the findings made a direct impact on US politics in the 1950s. One of the statistics derived from the *Male* volume was critical in both antihomosexual campaigns and in the nascent gay and lesbian rights movement. Kinsey and his colleagues found that 10 percent of men had lived exclusively homosexual lives for at least three years between the ages of sixteen and fifty-five (Kinsey, Pomeroy, and Martin 1948). The figure of 10 percent soon became fixed as the overall percentage of gays and lesbians in the United States (Drucker 2010). Antihomosexual campaigns of the 1950s, and particularly the anti-Communist witch hunts led by Joseph McCarthy (1908–1957), a US senator from Wisconsin, used that figure in order to claim (with no evidence) that 10 percent of federal government employees must be homosexual and therefore must be discovered and removed from employment. Meanwhile, gay and lesbian political movements, beginning in the mid- to late 1950s and growing much larger by the 1970s, proudly proclaimed that they made up 10 percent of the US population and deserved full legal rights. The American Law Institute also used the Kinsey Reports as inspiration for reforming legal codes addressing homosexual behavior (Allyn 1996). “Ten percent,” more than any specific number on the 0–6 scale, remains a well-known and widely reproduced figure representing the percentage of individuals identifying as homosexuals in the United States.

Successors of the Kinsey Scale

Sex researchers have reused and adapted the 0–6 scale into other forms, including Fritz Klein’s Klein Sexual Orientation Grid (KSOG). Klein designed the KSOG specifically for scientific researchers and fellow professional psychologists as a diagnostic tool for use with clients. Klein was inspired to create his adaptation of the 0–6 scale after many therapy sessions with clients who expressed their frustration that the terms *homosexual*, *heterosexual*, and *bisexual* were inadequate to expressing their true identities. As part of Klein’s interest in promoting bisexual identification and activism, the KSOG was designed to extend the scope of the 0–6 scale by including twenty-one questions about an individual’s sexual attractions, behaviors, and fantasies; social and emotional preferences; self-identification; and lifestyle. The user was asked to answer those questions in three time frames: the past (more than twelve months ago), the present (the last twelve months), and an ideal set of circumstances. A clinician could then identify the differences between patients’ actual and ideal activities and senses of sexual selfhood and could help them work through (or come to terms with) gaps between dreams and reality. The KSOG was published in both the 1978 and 1993 editions of *The Bisexual Option* and a 1985 coauthored article but required mathematical calculations of patients’ answers in order to provide clinicians with useful information. Unlike the 0–6 scale, which provided users with
only a single number to represent their identity, KSOG users needed professional assistance to interpret the meaning of a multinumber result such as 2-1-3-6-7-5-4. On the internet, however, the KSOG is the most popular sexual identity scale after the 0–6 scale, and it has since been turned into quizzes that quickly provide a compiled score (equivalent to a Kinsey scale number) after one fills out an online form.

Many other sexual identity scales, also largely aimed at scientific researchers, have been based on the 0–6 scale and, later on, the KSOG (Udis-Kessler 1999). They include Harry Benjamin’s Sex Orientation Scale, which categorized forms of “transvestism” and “transsexualism” in persons assigned a male gender at birth; Michael D. Storms’s Storms scale, which differentiated sex role and erotic orientation; Eli Coleman’s combined scale that examines identity categories, including gender, sex role, physical, and past/idealized; and the Measure of Sexual Identity Exploration and Commitment (MoSIEC) (Benjamin 1966; McWhirter, Sanders, and Reinisch 1990; Worthington et al. 2008). The MoSIEC, using twenty-two items, queries how American psychologist James E. Marcia’s 1966 identity status theory applies to the construction of sexual identity and assesses the processes of sexual identity development among persons of any orientation, whether or not researchers know that orientation beforehand.

The Kinsey Scale Online and Beyond

In the early twenty-first century, the 0–6 scale has been reproduced widely online, and numerous individuals use it as an instrument of self-discovery. It is particularly popular among teens and young people exploring their sexual identity, often along with their gender identity (Drucker 2012). Those who view the scale online can discuss their choice of scale number and the scale itself in internet forums; can take quizzes that promise to provide their “real” Kinsey scale number; can seek community with others contemplating their identities; and can anonymously express past sexual experiences and feelings about sexual identity that their friends and family members may neither know about nor sympathize with. While taking a quiz is unnecessary—all someone needs to do to find their appropriate number on the scale is look at it—quizzes in multiple languages add a dimension of fun (and usually some interpretative or glib inaccuracies in the explanations) to considerations of sexual identity.

The 0–6 scale remains popular because of its simplicity, although many of its viewers and users consider it too simple to represent fully the intersectionality of sexual and gender selfhoods that gender-fluid and gender-queer individuals express. Furthermore, studies of transgender individuals’ sexual identities “have acknowledged the need for conceptualizing pansexual identities” (Galupo et al. 2014, 427). People who claim more than one identity category, such as gay and asexual at the same time, also find continuum scales such as the 0–6 scale and KSOG problematic and unrepresentative of their whole personhood.
The linguistics of sexual and gender identity shift constantly, with new descriptors continuing to emerge; thus, new tools of measurement are necessary to capture new languages and forms of self-understanding (Galupo et al. 2014). Identifying as a Kinsey scale number may never take the place of the dominant English-language categorizations heterosexuality, bisexuality, and homosexuality, or of more recent terms such as monosexual, plurisexual/nonmonosexual, and asexual. Because of its historicity and longevity in the public eye, the 0–6 scale is likely to remain a popular first step in contemplating and discovering one’s unique sexual identity. Given the myriad of other scales and sources of information about sexual identity on the internet and beyond, though, it is not likely to be the last.

Kinship in Europe

ANTU SORAINEN
Researcher
University of Helsinki, Finland

Family models used by LGBTQI persons in Europe.

Kinship, as opposed to marriage and family, refers to a set of practices that address fundamental forms of human dependency, which may include birth, child-rearing, relations of emotional dependency and support, generational ties, illness, dying, and death, as defined by American philosopher of gender Judith Butler (2000). Scholars formative in the field of anthropology, starting from the mid-nineteenth century, sought to categorize, classify, and systematize the origins of kinship and the evolution of civilization. These included the American lawyer and anthropologist Lewis Henry Morgan (1818–1881), who, in his book Ancient Society (1877), studied concepts of kinship in Iroquois society and developed a theory of the three stages of human progress: from savagery to barbarism to civilization. Swiss anthropologist Johann Jakob Bachofen (1815–1887) insisted that prehistoric matriarchal societies predated and were subsumed by patriarchal ones, thus establishing motherhood as the source of all society, religion, and morality. Finnish sociologist Edward Westermarck (1862–1939) claimed that the early humans were actually monogamous, contrary to a widely held belief that early societies were based on promiscuity, thus establishing the nuclear family as the fundamental and universal unit of society. After World War II, French anthropologist Claude Lévi-Strauss (1908–2009) was formative in the development of structuralism, which is a method of analyzing kinship according to a binary system of opposites: brother/sister, husband/wife, father/son, and mother’s brother/sister’s son.

The Bias of the Reproductive Heterosexual Family Model

The American anthropologist David M. Schneider (1918–1995) questioned these approaches in the late 1960s. He pointed out that the kinship studies canon was based on “naturalizing” and “universalizing” those family and kinship habits that these scholars (and others) saw around them and was thus heavily biased toward reproduction in the heterosexual marriage and the importance of blood ties. This bias neglects the different unions and care networks formed by LGBTQI and queer-identified persons in Europe. Only through careful work by feminist and queer scholars has this rich history of marginalized desire, sexualities, and genders beyond the binary of male/female and heterosexuality/homosexuality been scrutinized in depth.
The clan, and later the married couple with children, have long been viewed as the core of Euro-American kinship, while the heteronormative family is considered essential and “natural” both in national legislations and in the rooted attitudes to kinship. This approach assumes that blood-related kinship roles, biological reproduction in wedlock, binary gender division of identity and labor, the hierarchical and oppositional order of two genders, and certain styles of care and parenting were innate and natural practices. In the twenty-first century, the legal landscape and social attitudes regarding intimate relationships and family forms have been swiftly changing, mostly becoming more liberal. However, the larger queer history of kin and family formation gets easily overshadowed, and perhaps lost, with the current focus on same-sex marriage.

The success of twenty-first-century measures to gain equal marriage rights for LGBTQI+ persons connects all sexualities to the reproductive heterosexual family model, causing other queer forms—either historical or present day—of intimate unions or relations of emotional dependency and support to be marginalized or forgotten in the LGBT campaigning for gay marriage. According to the US scholar of sexualities Lisa Duggan (2003), the reproductive same-sex marriage form of kinship abides by the increasingly dominant mode of neoliberal logic and creates new exclusions, as not all queer people want to get married and instead actively look to oppose the conventional forms in their relations with others and in forming support networks. Here, it is relevant to pose the question of what kinship has to do with the state and cultural institutions.

**Civil Partnerships**

Occasionally, the legal imagination and cultural institutions in some European countries have explored the limits of Euro-American kinship. In France and Germany, these explorations have taken place by extending some legal protections to nonmarried couples via civil partnerships. This happened in slightly different ways, while in both cases the new legislation also tended to reconfirm some of the most crucial aspects of the heteronormative logic of the legal imaginations of kinship that it sought to challenge.

For example, as Judith Butler (2000) has discussed, the French *pacte civil de solidarité* (PACS; civil solidarity pact) was approved in 1999 as a contractual form of civil union between any two adults independently of their sexuality—barring close blood relatives—for organizing their joint life. A PACS, as an intimate contract recognized by the state, entails certain rights and responsibilities—for example, in terms of inheritance—but less so than marriage.

Although the primary intention of the French PACS was to offer legal status to same-sex couples, the clear majority of actual PACS have been between opposite-sex couples. Individuals who register as a couple under such pacts are no longer considered *single*, and their official records will show their status as *pacsé*. In 2013, along with adoption rights,
PACS remain an option for them. Interestingly, instead of same-sex couples, it is mostly heterosexual couples who have made use of this form as they have seen in PACS a welcome extension of the narrow marriage form.

The Relevance of Inheritance and Caretaking

Butler (2000) suggests that the initial opposition to the PACS in France was an effort to make the state sustain a certain fantasy of marriage and nation whose hegemony was already, and irreversibly, challenged at the level of social practice. Here, it is noteworthy that explorations of kinship forms moving between the law, cultural institutions, and social practice are not a twenty-first-century development in Europe. For example, until the 1960s, in rural agrarian parts of eastern Finland it was an unofficial practice to adopt an adult son in the household if there were no “legal sons.” Everyday life was harsh during the Nordic winters, and every pair of hands was needed for survival. Arguably, an arrangement that resembled the official kinship system and adopted its terminology made the relationship more secure for both the adopted “son” and the elderly couple who got extra help and an “heir.” This arrangement provided advantages over the system of hired hands, which required cash as part of the salary system in a rural agrarian world where the exchange of goods, work, and social favors formed more of the base of social life than in the urban setting.

In the Balkan mountains, in households where there was no biological son, the custom of sworn virgins, or women who dressed and functioned socially as men under a vow of celibacy, dates back to the fifteenth century. It has been argued by mainstream anthropologists that these practices were done out of necessity (due to circumstances that disrupted the normative kinship model) as opposed to serving as valid alternatives to the heteronormative family model, but queer scholars have also pointed to the illegal desire or nonconformity of gender that could accompany these models. In Germany, existing adoption laws actually allow for adult adoption and are sometimes used to “fix” the inheritance and caretaking responsibilities between gay men (Borneman 1996).
Qamile Stema, One of the Last "Sworn Virgins" of Albania, 2010. In the Balkan mountains a custom of sworn virgins, or women who dressed and functioned socially as men under a vow of celibacy where there was no biological son in the household, dates back to the fifteenth century. It has been argued by mainstream anthropologists that these practices were done out of necessity (due to circumstances that disrupted the normative kinship model) as opposed to serving as valid alternatives to the heteronormative family model, but queer scholars have also pointed to the illegal desire or nonconformity of gender that could accompany these models.

In some other European countries, such as Ireland and Finland, the combination of same-sex marriage rights and the unequal inheritance tax categorizations for chosen heirs outside of wedlock has resulted in situations where children raised in the same rainbow family (i.e., families with queer-identifying parent/s) are set in unequal economic and legally defined kinship positions in terms of inheriting from their parents, or where people got married without an intimate relation to make a pact on caretaking based on the promise of a future payment in the form of inheritance for the caretaking partner (Sorainen 2015; Sorainen 2016; O’Loughlin 2017). More research is needed to say anything conclusive on these examples, but they serve to raise questions about the assumed “naturality” and context of kinship in Europe.

Other Queer Kinship Configurations

In the twenty-first century, several alternative family models to the normative couple form with a reproductive function coexist, including households headed by same-sex parents, family units with more than two parents, households and families that include non-blood-
related children, and households headed by a nonreproductive adult. There are also new
terms for these family units, such as rainbow families or clover families (families with more
than two queer-identifying parents). The idea and concept of “family” has been further
fragmented as a question of “choice,” both in terms of its form and its core members:
instead of seeing one’s family and relatives as being “given” by blood, many queer people
now think that it is better to choose their own family members from among their friends
and the LGBTQI community. In doing so, they redescribe the family form after cutting off or
distancing the homophobic bloodline, as many queers have experienced exclusions or
discrimination from their relatives or parents.

The field of new kinship studies looks at how humans create intimate relations beyond the
rather narrow definition of “family” as heterosexual parents with their biological children.
Queer kinship, for example, is not always familial, dyadic, or even sexual, yet queer
communities have provided a kind of tangible, emotional support different from, but in
ways similar to civil unions or the Euro-American understanding of kinship. Two examples
of queer kinship configurations—one historical and one from present times—help to widen
our views on the concept of kinship in Europe. First, researchers looking through historical
wills and other documents learned that the late nineteenth-century British poet known by
the pseudonym Michael Field was actually two women united in a queer union: Katharine
Harris Bradley (1846–1914) and her niece and ward, Edith Emma Cooper (1862–1913),
who were lifelong lovers and cohabitees. Their beloved dog complemented their union, and
together they created a rather esoteric and unique cosmology and worldview on which
their queer communion of three was based. This union crossed the familial lines of species
relations and challenged the incest taboo and the obligation to reproduce (in the biological
sense), while it also contributes to the archive of lesbian desire and age difference.

The second, more current example comes from Finland. In a 2018 essay, Antu Sorainen
focused on a family unit in Helsinki composed of four marginalized gay men in their fifties
whose lives and choices are not easily understood in light of the LGBTQI movements'
campaigns for gay marriage. Their support network is complex, as some of them live
together, some of them are in a relationship, and some of them sometimes have sex. The
fluid nature of their relationships defies their classification as a commune, a romantic
couple, or single gay men looking for sex, but is, in fact, something else that resembles, but
also challenges, both the heteronormative and homonormative (gay marriage versus the
lone cruising gay) ideas of intimate relations and care. Their complex mutual support
network includes cross-species and cross-national companionship: a stray dog the men
adopted together from Spain. Their support relations are not recognized in the legal
conceptualizations of what constitutes “kin,” as they practice domestic and intimate
arrangements that do not easily accommodate the general lexicons of family or kin.

The case opens up wider perspectives on how the lexicon of gay male intimacies connects
to wider gendered kinship patterns and to specific configurations and histories of gay male
sexualities and cultures. Masculine sexuality has often been seen as an antithesis of kinship in European cultures, as it has been seen as building on temporary, selfish desire, not on perspectives of building responsibilities of care and reproduction. Hence, gay men have no ready-made social forms available to them, and such case studies have provided information on how gay men adjust to, but also challenge the prevailing expectations of social relatedness and gay identity.

Together, these two examples show that queer kinship relies on conceptual and practical reconfigurations between legal, social, political, and cultural categorizations and conceptualizations. They suggest that we need to approach queer lives from the perspective of social practices and cultural identifications rather than only from the perspective of sex and sexuality, so as to reshape the terms of the everyday and legal understandings of who actually is “kin” and who is not.

Lambda Legal Defense and Education Fund

MICHAEL SMYTH
Associate Professor in Sociology
Susquehanna University, Selinsgrove, PA

JORDAN SANDERSON
Department of Sociology and Anthropology
Susquehanna University, Selinsgrove, PA

The first organization in the United States established to protect and advance the civil rights of LGBT and HIV-positive persons.

Lambda Legal Defense and Education Fund, more commonly known as Lambda Legal or simply Lambda, is the first organization formed in the United States aimed specifically at protecting and advancing the civil rights of the LGBT community and people living with HIV through impact litigation, public policy advocacy, and education and outreach. The organization was officially established in 1973 when the New York State Court of Appeals ruled in favor of founder William J. Thom's appellate petition to recognize Lambda as a nonprofit and to practice law in that capacity (In re Thom, 301 N.E.2d 542). The successful appeal followed a ruling in which a panel of lower court judges had turned down Lambda's petition for nonprofit status, opining that, in its view, the organization's mission was "neither benevolent nor charitable" (Lambda Legal 2018d). The appeal was the first in a plethora of legal victories for Lambda Legal over the next several decades.

Cause Lawyering

The legitimation of Lambda Legal through In re Thom led to the organization of a group of attorneys dedicated to pursuing the cause of LGBTQ rights. To that end, Lambda Legal has employed a practice known as impact litigation, or “cause lawyering,” wherein cases are selected for litigation based on the likelihood that success in the courtroom will not only further the principals' interests but also lead to social change favoring the class of individuals to which the principals belong (Etienne 2005). While cause lawyering can be controversial—coming at a time when there was little acceptance or even tolerance toward homosexual individuals, and other LGBTQ people and the majority of the legal community refused to advocate for this community—the role that Lambda Legal played filled a void, offering LGBTQ people needed advocacy in the legal arena (Docoo 2014).

In the more than forty-five years since its founding, Lambda Legal's victories in state and
federal courtrooms across the country have been legion and its educational outreach to the LGBT and HIV-positive community has expanded exponentially. In one of the first legal victories in which the newly formed nonprofit was involved, *Gay Student Organization of the University of New Hampshire v. Bonner* (376 F. Supp. 1088 [1974]), Lambda Legal participated in a successful attempt by a gay student organization at the University of New Hampshire to overturn the school’s ban on its social events. In effect, the decision required the university to treat LGBT organizations like it treated other student groups. Over the course of the 1980s and 1990s, the organization redoubled its efforts against state and institutional discrimination against the LGBT community, shifting its focus somewhat to include antigay bias in corporate America and state-run institutions.

**Supreme Court Cases**

Lambda Legal has been party to a number of landmark US Supreme Court battles related to LGBT rights. In 1996, for example, Lambda partnered with the American Civil Liberties Union (ACLU) and various Colorado-based attorneys to secure a victory in *Romer v. Evans* (1996), a case focused on whether Amendment 2 of Colorado’s state constitution violated the equal protection clause of the Fourteenth Amendment to the US Constitution. Specifically, Richard G. Evans filed suit after a statewide referendum in Colorado passed Amendment 2, which repealed all ordinances enacted by the cities of Aspen, Boulder, and Denver that banned discrimination based on sexual orientation in many transactions and services and prohibited future judicial, executive, and legislative action protecting the named class, being of a “homosexual, lesbian, or bisexual orientation” (*Romer v. Evans* 517 U.S. 620). At the time it was decided, the court’s six to three decision in favor of the plaintiff was hailed as “the single most positive Supreme Court ruling in the history of the gay rights movement” (Lambda Legal 2018f). In *Romer*, the court made it “clear that lesbians, gay men, and bisexuals have the same right to seek government protection against discrimination in the United States as any other group of people” (Lambda Legal 2018f). Perhaps as important as the holding itself, the court’s decision in *Romer v. Evans* set into motion another landmark case that the court would hear seven years later (Davidson 2016).

In September 1998 police arrested John Lawrence and Tyron Garner in Lawrence’s Houston apartment and charged the two with having consensual sex in violation of Texas’s “homosexual conduct” law. The men pleaded nolo contendere after their motion to quash the charges as unconstitutional was denied in criminal court. The following year, Lambda Legal challenged the lower court’s decision to the Fourteenth Court of Appeals in Houston on constitutional grounds. The conviction was initially overturned but was later reinstated by a larger panel of the same Texas court. Lambda appealed again, but Texas’s highest court refused to hear the case. Having exhausted its options at the state level, in 2002 Lambda Legal and Lawrence petitioned the US Supreme Court to review Texas’s homosexual
conducted law based on two independent claims: first, that the law violated the equal protection clause of the Fourteenth Amendment, and second, that it violated rights of privacy and liberty. In December 2002 the court granted a writ of certiorari in the case, and in January 2003 Lambda Legal filed its brief urging the court to overturn Texas’s homosexual conduct law in *Lawrence v. Texas*. Following oral arguments, most notably by Paul Smith for the plaintiff, in June 2003 the justices ruled six to three in favor of Lawrence’s argument. Writing for the majority, Justice Anthony Kennedy reasoned that “[homosexuals’] right to liberty under the Due Process Clause gives them the full right to engage in their conduct without intervention of the government” (*Lawrence v. Texas*, 539 US 558 [USSC 2003]). Directly contradicting the court’s earlier decision in *Bowers v. Hardwick*, 478 US 186 ([USSC 1986]), with its “sweeping language about gay people’s equal rights to liberty” ([Lambda Legal 2018e], *Lawrence v. Texas* (2003) is widely considered to be the most important breakthrough for gay rights in the current era. Without a doubt, the case paved the way for subsequent landmark decisions, particularly those related to marriage equality, such as *Obergefell v. Himes* (2015).

**Other Notable Cases**

Lambda Legal has continued to expand its legacy of involvement in landmark cases related to LGBTQ rights. In the realm of employment law, for example, Lambda Legal petitioned the Seventh Circuit Court of Appeals to reverse a lower court decision and allow Kimberly Hively, a lesbian, to present her case against Ivy Tech Community College. Having worked as an instructor at the institution for more than fourteen years, Hively claimed that Ivy Tech had denied her both full-time employment and promotions and ultimately terminated her employment because of her sexual orientation. Attorneys through Lambda Legal argued for the plaintiff in *Hively v. Ivy Tech Community College* (853 F. 3d 338; Court of Appeals, 7th Circuit [2017]), convincing the judges to reexamine the case, since the Supreme Court had not previously ruled on the issue of Title VII and sexual orientation. Although traditionally it had been assumed that sexual orientation was excluded from protection under the Civil Rights Act of 1964, in an eight to three decision the Seventh Circuit Court ultimately ruled that Title VII’s protection of individuals based on their race, color, religion, sex, and national origin also protected against discrimination based on sexual orientation. As Greg Nevins of Lambda Legal noted, “[The decision in *Hively*] is a gamechanger for lesbian and gay employees facing discrimination in the workplace and sends a clear message to employers: it is against the law to discriminate on the basis of sexual orientation” ([Lambda Legal 2017]).

As part of its campaign to protect and extend the rights of people living with HIV, in *Hickman v. Donna Curry Investments, LLC, et al.* (2006) Lambda Legal announced that it had settled a lawsuit filed in the US District Court for the District of Nevada on behalf of a man who was fired by a Subway restaurant owner because he had HIV. The fully executed
settlement between Hickman and his employer required that the company provide written policies explicitly stating that it does not discriminate against any qualified individuals living with HIV. Furthermore, all managers and employees in supervisory roles had to thereafter be trained on how HIV is transmitted, thus putting to rest any concern about HIV transmission in the food service industry, and they would be instructed regarding the legal obligation not to discriminate against existing or potential employees based on their HIV status (Lambda Legal 2006).

More recently, on 30 May 2018 Lambda Legal and OutServe-SLDN joined with pro bono cocounsel in filing suit for declaratory and injunctive relief in US District Court for the Eastern District of Virginia on behalf of a sergeant in the DC Army National Guard who was denied the opportunity to serve as an officer and faced possible discharge from the US armed services because he was living with HIV. The lawsuit challenged the Pentagon’s policies preventing enlistment, deployment, or commissioning as an officer of a person living with HIV, and likely would affect implementation of the “deploy or get out” policy unveiled by the Donald Trump administration in February 2018. The deploy or get out policy directs the Pentagon to identify service members who cannot be deployed to military posts outside of the United States for more than twelve consecutive months and to separate them from military service. Despite current scientific and medical knowledge to the contrary, most service members living with HIV remain classified as nondeployable under military policies developed in the 1990s. One of the largest employers in the world, the Department of Defense, like other employers, is not allowed to discriminate against people living with HIV without reason. “The Pentagon needs to catch up with the twenty-first century. Recruitment, retention, deployment, and commissioning should be based on a candidate’s qualifications to serve, not unfounded fears about HIV,” a spokesperson for Lambda Legal observed (Lambda Legal 2018a). Harrison v. Mattis (2018), along with a companion complaint (Voe v. Mattias [2018]), was pending in US District Court as of June 2018.

Expansion

Since its founding in 1973, Lambda Legal has grown exponentially. In just the four years from 2010 to 2014, the number of cases on its docket soared 65 percent, its social media audience increased by 802 percent (from 31,351 to 282,804), and its operating budget expanded by 58 percent. Recognizing that legal victories alone are insufficient to secure the future for LGBT people and all those living with HIV, the central mission—to advance the rights of its constituency through impact litigation—was expanded to include multiple programs aimed at promoting LGBT and HIV-positive individuals’ ability to access and secure the rights and privileges they had won in the courtroom. Foremost among these is Lambda’s Fair Courts Project, which aims to ensure that the judiciary remains free to “make decisions based on constitutional and legal principles—not politics or popular
opinion" (Lambda Legal 2018b). In addition, Lambda Legal maintains programs specifically intended to provide advocacy and disseminate information about such diverse issues as workplace equality, family law, laws affecting LGBT immigrants and asylum seekers, the well-being of LGBT and HIV+ seniors, low-income LGBT and HIV-positive populations, and police misconduct. Lambda maintains an extensive web presence, which includes a legal help desk and a media center on its website.

https://www.lambdalegal.org/in-court/cases/romer-v-evans
At a basic level, language can be viewed as a highly elaborate semiotic system that facilitates interaction by making communication possible. But it also accomplishes much more; it indexes various aspects of a speaker’s—or community of speakers’—identity, thus signaling meanings that go far beyond the specific contents of a message.

**Language of and Language about**

In discussing language in relation to LGBTQI+ issues, the focus of research by linguists has often been twofold. First, it preoccupied itself with how homosexuals (initially, mainly, homosexual men and only later lesbians, bisexuals, transgender and transsexual persons, queers, intersex persons, etc.) use language. What, in other words, if anything, distinguishes homosexuals linguistically from nonhomosexuals. In this context, the meaning of homosexuals has traditionally been males who have sex with males and females who have sex with females. Initially, the question of whether these individuals self-identify as homosexuals, or “gay,” did not receive particular attention. However, the situation later changed, especially following the rise of gay liberation movements in the 1960s and especially the 1970s. Most research viewed the perceived linguistic differences as culturally based rather than inherent. There is also, however, another perspective that has received attention, and this is the language used by non-LGBTQI+ people to talk about and, at times, to them.

Research on the language used by gays and lesbians has its roots in a preexisting interest in the relationship between language and masculinity and femininity, and, later, language and sexuality, in the 1970s and 1990s, respectively. It later expanded to include other sexual minorities and owes a considerable debt to the feminist movement and the research that the latter inspired. One should bear in mind, however, when this research began; as previously mentioned, it was mainly concerned with homosexual men; lesbians were almost an aside, and it was not until much later that the whole gamut of postmodern sexualities began to be investigated. This fact should be kept in mind whenever terms such as gay and homosexual appear in this entry. As Deborah Cameron and Don Kulick note, in
the field of language and sexuality the question that has been asked most is: “how does the language of homosexuals differ from that of heterosexuals?” (2006, 3). Early work carried out in the 1970s and early 1980s concentrated on finding differences between the way in which men speak and how women speak, trying to identify the culturally based differences in language use between the sexes.

Interest in the distinctive language of (mainly) homosexual men in Europe and North America has a relatively long history (Cameron 2005), which can be dated back to the late 1920s. Initially, what seems to have interested researchers the most have been the words and phrases used mainly by homosexual men, later resulting in the publication of a number of “gay” dictionaries, glossaries, and lexicons. In addition to the dictionaries, there were also some more extensive studies on language use (i.e., language in context—what later came to be known as “discourse”) by, again, mainly homosexual men. These include Donald Webster Cory (1951) and David Sonenschein ([1969] 2006), who argued that the main function of a gay slang was not mainly about lowering one’s visibility as a gay person but, rather, about signaling in-group membership. But it is the period between 1980 and the present that saw what Kulick terms an “explosion of work on gay language” (2000, 243).

It has to be said that the study of the language of and on homosexuality and other queer identities presents some challenges, the first of which is the difficulty of locating sources. This is a result of the stigma generally associated with homosexual practices. This is particularly true of language originating from within queer circles, as opposed to that used by nonhomosexuals to refer to what is sometimes seen as a problem, sometimes as an example of moral degeneration, and sometimes as a medical issue. Marcel Barriault (2009) argues that an important source on the language-homosexuality nexus is gay male erotica and pornography. This, as well as many other records, were either suppressed or destroyed, and those that survived were often censored and altered, which, in itself, provides another level of evidence. Indeed, early references to a “gay lexicon” are attested to in at least two examples of pornographic literature of the Victorian era: *The Sins of the Cities of the Plain; or, The Recollections of a Mary-Ann, with Short Essays on Sodomy and Tribadism* (1881) and *Teleny; or, The Reverse of the Medal* (1893). Although the former purports to be the autobiography of a famous male London prostitute (*Mary-Ann* being slang for a homosexual), the book is probably the work of James Campbell Reddie (1807–1878) and Simeon Solomon (1840–1905). The authorship of the latter is unknown, although it has often been attributed to the famed Irish writer Oscar Wilde (1854–1900). Of the two, because of its alleged autobiographical nature, *Sins* delves more fully into homosexual slang of the time. Indeed, it offers a sort of homosexual slang dictionary. Most of the words listed refer to sexual organs, both male and female—such as *stones* and *bubby* (testicles) and *charms* (the male genitals)—and sexual activities, such as “to tongue” (to fellate). As Jonathon Green (2014) notes, however, all the listed lexical items would have been applicable to heterosexual sexual activity, too. It is therefore the context that provided the homosexual connotation, apparently lending support to Kulick’s theses that to speak of
an exclusively "gay language" is somewhat misleading.

The aforementioned examples are instances of language of homosexuality. The nineteenth century is also, however, a resource for the emergence of language on homosexuality, especially in the socioscientific field. In a book titled *La corruption à Paris* (1889; Corruption in Paris), the French social observer Ali Coffignon created a taxonomy of homosexual types. It is not clear if the terms he uses to label the various “types” were in common usage at the time and if homosexuals themselves employed them. They are nonetheless important as linguistic signs that codify—albeit disapprovingly—homosexuals (*pédér-astes*) and homosexual behavior. Coffignon divides homosexual men into two main groups: active and passive. The former are *amateurs, entreteneurs*, or *souteneurs*. The latter comprise the *pétits-jésus* (little jesuses), *jésus* (jesuses), and *tantes* (aunties). The *entreteneurs* are basically closeted gay men. Often belonging to well-to-do families, they have everything to lose by revealing their condition. The *souteneurs* are men who have been found out and received punishment; they keep their jesuses, whom they use to procure new young men (*faire chanter la rivette*) with whom they then proceed to have intercourse. The little jesuses or aunties (notice the feminization) are young males seduced and then used by the *amateurs*, who are then trained to become prostitutes, whether they themselves are homosexual or not.

**Homosexual Argots**

Historically, “in-group languages”—sometimes referred to as “argot,” “slang,” or “jargon”—have served a number of functions. First, they signal membership of a group, often while simultaneously concealing it to outsiders. In a world in which nonadherence to the prevailing societal rules about, in this case, appropriate sexual behavior can literally be fatal, this cryptic signaling of belonging allows for interactions while offering protection, through what M. A. K. Halliday (1976) defined as an "anti-language": a coded use of familiar words and expressions designed to exclude outsiders. Indeed, anti-languages often develop among socially excluded, oppressed, and stigmatized groups, such as criminals or members of politically proscribed groups, in an effort not only for members to hide and protect themselves but also to show, through unusual linguistic practices, defiance of mainstream norms.

There are documented examples of this practice in the distant past, even in highly cultured and literary circles. For example, Giovanni Dall'Orto (2015) discusses the nature and function of the *gergo* (“slang” or “jargon”) *burchiellesco* in fifteenth- and sixteenth-century Italy. It takes its name from the poetry of Domenico di Giovanni (1404–1449), also known as Burchiello. Dall'Orto explains that the essence of *poesia burcellesca* (poetry in the style of Burchiello) is humor that relies on puns and double entendres based on slang terms that were already in use. Although at a highly complex level, this type of literary communication relies on the interactive meaning-making efforts between author and interlocutor, like
those in action in the slang-based communication discussed by the aforementioned authors. Interestingly, as Dall'Orto points out, Burchiello’s poetry was homophobic. He—and his readers—were laughing at not with homosexuals.

In 1941 Gershon Legman (1917–1999) compiled “The Language of Homosexuality: An American Glossary.” He begins by discussing the term homosexual, as well as all the terms then current in the United States to describe homosexuals and their sexual practices. The author comments on the paucity of terms in relation to female homosexuality, which he curiously attributes to the “tradition of gentlemanly restraint among lesbians” (2:1154). He acknowledges that some of the listed terms are also used by heterosexuals, which is generally true of those present in most argots, as there are no truly discrete homosexual languages. Most of the entries pertain to sexual activity. However, interestingly, Legman comments on some linguistic behavior that in later research will be considered markers of “in-group” identity and of “performativity” (the practice of “enacting” or affirming identity) through repeated and repeatable linguistic acts, such as “the substitution of feminine pronouns and titles for properly masculine ones” (2:1155).

The signaling of identity and in-group belonging through linguistic practices need not only rely on single words. It can, of course, make use of discursive practices that encode and embody belonging by referring, for example, to certain cultural milieus. In his 2003 work on London’s geography of homosexuality in the period from 1885 to 1914, Matt Cook discusses the references to Hellenic ideals of beauty and love, in particular “Greek love”—that is, homosexual love—that highly educated men used to reify and publicly discuss their experiences, their desires, and often their wishes for social and legal reform. Indeed, homoerotic literature inspired by Hellenism continued to be published until at least the 1930s. In Cook’s words, “It had become a barely obscured code which yet enabled continuing communication about an outlawed set of practices” (126–127). Yet again, language was used by homosexuals to simultaneously bring their lived experience into the open and keep a protective veil on it.

Cory dedicates one chapter of his 1951 book on homosexuality in the United States to “gay slang.” He also offers sociological explanations for the phenomenon—namely, the need to dissimulate but also, crucially, to feel empowered by electing to define themselves rather than being defined by (often unsympathetic) others. While discussing the lexicon used by American, mostly male, homosexuals—and in particular the then-emerging term gay—Cory notes that “one of the most desirable purposes [that it offers] is that it facilitates discarding the mask [i.e., to “come out,” if only intragroup] by offering a language free of odium [in other words to feel empowered through a process of relabeling]” (108; emphasis added).

In 1972 The Queens’ Vernacular: A Gay Lexicon, by Bruce Rodgers, was published. This was a rather extensive work of more than 219 pages. Although The Queens’ Vernacular is still
essentially a list of lexical items (nouns, adjectives, verbs), it shows, in embryo but more explicitly than previous works, a shift toward an understanding of language as constitutive of gay men’s and women’s identities, as well as signaling in-group belonging and resistance to the majority’s oppressive culture. Tellingly, in his introduction, Rodgers writes that

*Gay slang, like black slang, enriches our language immeasurably.... [It] was invented, coined, dished and shrieked by the Gay stereotypes: The flaming faggots, men who look like women, flagrant wrist-benders, the women who don't shave their legs, all those who find it difficult to be accepted for what they feel and are even within the pariah Gay subculture.*

*(11; EMPHASIS ADDED)*

**Examples of Documented Argots**

Having mentioned gay argots, the following are examples of a small selection of them. They represent different geographical and cultural areas, such as Britain, Spain, the Philippines, and South Africa. Since the 1980s, investigations into these argots have become more frequent and broader in scope so as to somewhat rectify the previous Anglo-American, male homosexual bias. Space limitations do not allow a full survey of the interplay between sexuality and gender identity across the world. Therefore, what follows can offer only a partial overview of research conducted across different cultures and areas of the world.

One of the most interesting examples of a well-developed gay slang is the British *Polari* *(Baker 2002)*. Polari (the name derives from Italian *parlare*, meaning “to speak”) consisted of around 100 words derived from different sources. Among them is the lingua franca used by entertainers in the eighteenth and nineteenth centuries *(Cameron and Kulick 2003)*. Leslie Cox and Richard Fay *(1994)* suggest that, in the 1940s and 1950s, at least some of the vocabulary was in usage in cities such as Liverpool, Bristol, and London and was strongly associated with male homosexuality. Polari’s links to pre-Stonewall times and its connotations of effeminacy led gay liberation activists to oppose it. More recently, however, there have been efforts to re-evaluate it and to preserve it, as witnessed by Paul Baker’s 2004 dictionary *Fantabulosa: A Dictionary of Polari and Gay Slang* and by the launch of an app dedicated to it. Gay slangs have been documented and studied in countries other than the United Kingdom and the United States. Some of these are briefly introduced below.

**Spain** In documenting the argot used by (mostly) gay men in Spain, Ferran Pereda *(2004)* has commented on its linguistic characteristics, most of which are applicable to other argots. This includes semantic change, whereby a word is borrowed from the general vocabulary and transported into the argot with an altered meaning. For example, the
Spanish word *hermana* (sister) is used by gay men to mean a very close, platonic friend, or a “bosom buddy.” This word also exemplifies another characteristic of gay argots—namely, the feminization of nouns and adjectives. So, *hermana*, which in ordinary Spanish has a female referent, has in the gay argot a male one, as in English and Italian where gay men often refer to each other as “girlfriend” and *amica* (girlfriend) or *sorella* (sister). An early example of the use of the word *sister* to refer to fellow homosexuals can be found in one of the cases presented by Richard von Krafft-Ebing in his *Psychopathia sexualis* (1886), where—quoting the words of one of his subjects—he writes, “In T. I was unspeakably unhappy, in spite of some ‘sisters’ whom I found” (*Krafft-Ebing 1947, 199*). This practice, ubiquitous across languages, allows the speaker to play and subvert societal heteronormativity and ideas of masculinity and to depotentiate, by actually embracing them, the majority’s prejudices (that a gay man is partly or wholly a woman, or “non-man”). Another characteristic is the use of prefixes and suffixes, especially to coin new words. Very common is the use of *mari* (from *maricon*, or “faggot”) to “homosexualize” words and create neologisms such as *marifiesta* for a party (*fiesta*) organized by and for gay men. Another common lexical creation that uses the same prefix is *marimacho*, more or less equivalent to the English *tomboy*. The term is used to refer to a woman who, in her physical appearance and her actions, resembles a male. Francisco Molina Díaz, in his 2014 study of homosexual-related terms in Spanish academic dictionaries, notes that the term was first recorded in 1734 and has been in usage ever since, often with pejorative connotations.

Another phenomenon is the borrowing of foreign words, mainly English. Many of these denote sexual practices, such as *barebacking*, *cruising*, and *fist fucking*; others refer to types of people, or “tribes,” that gay men may feel a connection with: *bear*, *chubby*, and *drag queen*. This, in effect, results in what linguists call *code-mixing*. As Heidi Minning notes about the same phenomenon in relation to German, this helps construct “group membership and a sense of the self as a participant in larger gay and lesbian local and transnational cultures” (2004, 65). Another characteristic of the Spanish gay argot noted by Pereda is the use of non-gender-specific language, often to maintain vagueness about one’s sexual orientation. So one finds *pareja* (couple) for *marido* (husband) and *mujer* (wife). Then there is the use of hyperbole, clichés, metaphors, and puns; the shortening of words; vocatives; compound words; onomatopoeia; and, finally, the reliance on extralinguistic devices, such as hand gestures. In addition to extralinguistic elements, the speech of gay men has often been associated with and identified by the use of particular types of what linguists call “suprasegmentals.” These are features such as intonation and voice pitch, as well as particular phonological traits, such as breathiness—the lengthening of sounds such as /s/ and /z/. Collectively, these features have often been referred to as “the voice.” This, however, does not mean that all speakers who use elements of “the voice” are, in fact, homosexual, or that all those who do. “The voice,” especially coupled with a certain type of hand gesture, is one of the main characteristics of the phenomenon known as “camp.”

**Philippines, Indonesia, China, and Thailand** Donn Hart and Harriett Hart (*1990*) have
documented what is known in the Philippines as *swardspeak* (from the word that designates male homosexuals: *swards*), also known as *Bekimon* and *lingo gay*. This argot is well known and widely used by those who work in fashion and entertainment. *Swardspeak* borrows from Tagalog, English, Spanish, and even Japanese and is heavily influenced by pop, celebrity, and consumer culture. J. Neil C. Garcia (2008) situates the conceptual birth of Philippine self-reflective gay culture in the 1960s. It is during this period that open reflection of the terminology used to refer to gays (especially men) begins, especially the term *bakla*. *Bakla* is often translated as “gay”; its meaning, however, is much more fluid and complex. In his study of gay culture in the Philippines, Garcia observes that *bakla* and *homosexual* are not the same. Mainly, this is because the dichotomous distinction homo/hetero has no equivalent in Filipino culture. It does not, for example, necessarily denote sexual orientation and cannot be used to refer to a female homosexual, for whom the derivative term *babaeng bakla* is used instead. As is the case for other nationalities, the economic situation in the Philippines has resulted in emigration and the consequent formation of Filipino diasporas across the world. Because, as Gary Simes puts it, language is the “most transportable item an individual possesses” (quoted in Manalansan 1995, 250), it is inevitable that the linguistic practices of gay Filipinos spread and adapt in the new social, economic, and cultural settings in which gay Filipinos find themselves. In his research on Filipino gay argot in New York City, Martin F. Manalansan IV (1995) argues that *swardspeak* is continually transformed by its users in response to local and global events. In part, this evolution is driven by resistance to the pressures of homogenization originating in white, gay culture. Consequently, gay Filipinos in the United States enact their evolving identity through linguistic choices at all levels, from the lexical to the discursive. As Manalansan argues, gay immigrants and laborers do not accept passively the cultural and social hierarchies society imposes on them. On the contrary, they engage with and resist them through language.

Tom Boellstorff (2004) researched gay language in Indonesia. In that country, many homosexual men speak what they call *bahasa gay* (gay language). *Bahasa gay* comprises vocabulary, intonation, and pragmatics (contextually determined elements); however, what speakers of this language variety find more prominent is the lexical element. This is a language, or “code,” based on *bahasa Indonesia* (Indonesian, the national language). *Bahasa gay* is characterized by derivational processes, which often include suffixes and word substitutions. For example, the words *aluk, muttu, sibollo*, and *tabu*—all of unknown origin—are used in place of the existing Indonesian terms to mean, respectively, “penis,” “to have sex,” “friend,” and “to eat.” Interestingly, not all the words refer to the sexual sphere; *indexicality* (the signaling of gay identity) operates at various levels of the lexical and semantic fields. The words *kula* (“I,” “me,” “my”) and *sampeyan* (you), for example, which derive from Javanese, encode gender identity at the level of pronouns and possessive adjectives. Boellstorff notes that *bahasa gay* words are never coined from Sanskrit or Arabic words, despite their frequency in Indonesian. He argues that what this indicates is
that “gay subjectivities take form less through organized religion or the historical links between India and Indonesia than through national and transnational mass media” (256).

Like all living languages and language varieties, bahasa gay is productive. What this means is that it—or, to be precise, its users—continue to create, or produce, new words and expression by resorting to the existing rules, grammatical and otherwise, of the language. There are several ways to do this. One of the most common is to retain “the first syllable of a standard Indonesian word and then [modify] the ending” (255). To be a fluent bahasa gay speaker, one does not need to know all the words of its vocabulary; instead, one needs to be able to master the rules to be a productive (in the sense specified previously) user.

In a 1988 work (republished in 1992) Fang-fu Ruan and Yung-mei Tsai discussed homosexuality in China. Using a corpus of letters written by homosexual men, they were able to describe and discuss the isolation and the suffering of gay people in the People’s Republic of China and their wish for a better future. In the intervening thirty years, China has undergone an enormous transformation, both economically and socially.

Homosexuality is more visible and so are studies of it, including its linguistic aspects. Wei Wei (2007) researched and discussed the evolution of gay identities in contemporary China. He concentrated in particular on the city of Chengdu, the capital of the province of Sichuan. Wei focuses on piao piao, the identity of local homosexual men. This identity emerged before tongzhi, the predominant Chinese gay identity that, Wei argues, is an invention by gay activists beginning in the early 2000s that is a local appropriation of imported, Western models of homosexual identity. The classic Chinese view of homosexuality was that it was a series of tendencies and inclinations, rather than an innate “nature” or identity. The Chinese language has had terms relating to homosexuality for a long time. These include the rather obscure duan xiu zhi pi (the passion of the cut sleeve) and fen tao (the bitten peach), both of which derived from classical Chinese literature. More recent, and more transparent, are nanfeng (male trend) and xianghuo xiongdi (allied brothers). Following the creation of the People’s Republic of China, the term tongxinglian (same-sex love/homosexual) came into use to refer to homosexuals. Given the size of China, there is considerable geographical variation in the terms used to refer to homosexuals. However, because most words are derogatory in nature, most homosexuals do not use them. In addition, traditional words do not denote a permanent, “innate,” and stable gay identity. Yet, this is what has been emerging since the 1990s, influenced by European and American models of homosexuality. In Chengdu, this new, self-conscious identity has been embodied linguistically by the term piao piao, used as a noun to refer to homosexuals. The word also has derivative meanings; these include piao chang (a cruising area). From a linguistic point of view, it is interesting to note that, originally, in standard Chinese, piao was used as an intransitive verb. Locally, however, gay men use it as a transitive, as in “to piao somebody,” which means “to cruise somebody or check somebody out.” Piao yu is the name that the piao piao give to their language. Like other argots discussed in this entry, piao yu is an elaboration of existing linguistic resources.
used by the gay, mainly male, subculture to signal and enact a preferred identity—one that, in this case, is not just a local replica of the Western model of homosexuality.

**MOFFIE**

The term *moffie* is used by some South Africans to denote a gay or effeminate man. It is used mainly by Afrikaans speakers, particularly among white and so-called coloured people, a broad racial category that includes mixed-race people and those of indigenous South African (Khoisan) or Malay descent. The word *moffie* is believed to stem from seafarers who used it as a derogatory reference to men who were well groomed or seen as “delicate” or weak, its documented use stretching back as early as 1929 ([Luirink 2000](Luirink2000)).

Since its earliest use, the term became important to gender construction in white Afrikaner culture, where sexual minorities and gender-nonconforming men were set up as a foil to idealized patriarchal versions of masculinity. Under Nationalist politics (1948–1994), the state viewed homosexuality as threatening to the form of conservative patriarchal masculinity that underpinned white Afrikaner power in the country, and sexual minorities “did not fit into the prevailing meta-narratives of Afrikaners as heroic *volk* [nation or people] or racist scoundrels” ([Pieterse 2013, 620](Pieterse2013)). Consequently, the term *moffie* continues to carry a negative connotation among mostly white Afrikaans-speaking people.

Within coloured cultures, moffies were historically integrated into communities and were mostly seen as humorous figures as they were associated with quick wit and sassy, flamboyant personalities. Coloured moffies were simultaneously viewed as “an important constituent of coloured culture and an embarrassing element [for coloured people]” ([Tucker 2009, 149](Tucker2009)). The coloured moffie was a more acceptable, nonthreatening figure because of this association with humor and wit, and thus the scant representations of queer people in South African popular entertainment often relied on this figure. In fact, cross-dressing coloured moffies have even taken part in the Cape Minstrel Carnival, a large public display in the city of Cape Town, since the 1930s, a time when both cross-dressing and homosexuality were illegal in the country ([Pacey 2014](Pacey2014)). Moffies thus played a subversive role in the patriarchal pre-apartheid and apartheid state by challenging gender binaries and were a visible and at times celebrated part of coloured culture. Despite their ambivalent integration, however, effeminate men (and all queer people) were and are still ostracized and are frequently the victims of hate crimes in the country.

Cape coloured gay men have developed their own lexicon known as *moffietaal* (queer language) or Gayle. This lexicon has since spread to other racial groups and expanded out of Cape Town as well ([Cage and Evans 2003](Cage2003)). One of the features of Gayle is that
female names are used in place of certain words as a type of code that many gay men would understand. The cohesiveness of the coloured gay community has led to many queer men taking pride in the title *moffie*, embracing cross-dressing and effeminate gestures and styles of speaking, and calling each other *moffie* as a term of endearment and to solidify their sense of community.

Even so, the word still holds power to enforce patriarchal masculine expectations through its use as hate speech and as a form of ridicule. André Carl van der Merwe’s autobiographical book *Moffie* (2006) demonstrates how this word is used for shaming the protagonist about his failure to live up to the norms of white, Afrikaner, patriarchal masculinity. The protagonist, Nicholas, is called a *moffie* by his father, and his mother says that it is “the most despicable thing you could call anybody, never mind your own son” (20). The multiple meanings of this word and its cultural specificity make it a complex component of South African queer identities.

**BIBLIOGRAPHY**

**Grant Andrews**  
*Stellenbosch University*  
*Stellenbosch, South Africa*

Elsewhere, it has been mentioned that “gayspeak” can be in different parts of the linguistic system of a language, including its intonational patterns. Chi-kukHau (2007) has
investigated the acoustic characteristics of gay speech and perceived sexual orientations. In his empirical work, he was able to identify some differences in the production of certain sounds, such as /s/, which are often recognized—and not only in Chinese—as typical of gay speech. These were also frequently found, however, in the speech of straight men, but their identification as markers of a gay sexual orientation persists in China as elsewhere.

Thailand offers another interesting case for the study of homosexual identity in Asia and for the role that language plays in it. Like other non-Western locations, Thailand is often represented abroad as a “gay paradise.” In reality, the situation is far more complex and nuanced. Megan Sinnott (2000) conducted research on the representation of transgendered and/or homosexual identity in the Thai press. She argues that the representations are varied and often contradictory and that this reflects evolving debates within society and the formation of a local gay identity. In Thailand, homosexuality as a category is less often used. Instead, notions of masculinity and femininity are used. The terms *tom* and *kathoey* indicate, respectively, a masculine woman or a feminine man. *Kathoey* is the only traditional Thai term that refers to a “sexually eccentric individual” (Jackson 1995, 23), rather than “sexually eccentric behavior.” The term indicates what, in modern Western terms, might be referred to as a third sexual category. It should be noted that the term usually refers to a man, rarely a woman. More recently, new terms have appeared; they witness the emergence of new, evolving homosexual identities, including *tom-dee* and *gay*. The former derives from the English *tomboy* and refers to a masculine-identified woman. *Dee* refers to the feminine component of the *tom* and is derived from the English word *lady*. There is a long history of same-sex sexual activities between women in Thai culture; however, a recognizable transgendered identity began to appear in or just after the 1970s. Lexically, the shift is reflected in the change from the term *len-pheuan* (playing friends) to *tom-dee*. Peter A. Jackson has devoted considerable attention to homosexuality in Thailand, including its linguistic aspects. In a 1995 study of the topic through letters to a Thai “agony aunt” (someone who dispenses advice by replying to letters addressed to her or him, usually in a print publication but increasingly online)—or, in this case, “uncle”—he reviews the terminology relating to homosexuality, used both by heterosexuals (language about homosexuals) and by homosexuals themselves (language of homosexuals), as revealed by the correspondence he examined. He points out that the now-archaic term *len sawat* (literally meaning “playing love”) has acquired a sexual connotation and has come to denote anal sexual activity between males. It is interesting to note that the use of *len* (playing) is not in itself an indication that homosexual activity is seen by heterosexual society as harmless or in any way natural. Despite this, in the letters examined by Jackson, there is ample evidence that this and etymologically similar words are used by homosexuals themselves. This illustrates once again that a minority community can reappropriate lexical items in a move that both depotentiates hostility and enacts empowerment. During the second half of the twentieth century, as Western influence grew, Western-influenced terms to describe homosexuality and homosexual activity were
introduced. So rak-ruam-phet ("love for the same gender"—i.e., homosexuality) has been introduced, coined on the model of the existing rak-tang-phet ("love of a different gender"—i.e., heterosexuality). More recently, in another sign of cultural adaptation, the term for bisexuality, rak-sorng-phet (to love two genders), came into common usage.

**South Africa** South Africa presents an interesting case because of the double oppression of homophobia, which was encoded legislatively, and racial discrimination, enacted through the apartheid system. There, the complexities of the racial situation, which initially divided the population between whites, blacks, and coloured, and between Afrikaans and English speakers, helped shape the argot of male homosexuals. Ken Cage has documented and named it *Gayle* (*Cage and Evans 2003*). Initially it was used by coloured, Afrikaans-speaking gay men in the Western Cape but was later adopted by English-speaking whites. Following the end of apartheid, and the increased social mixing, usage of Gayle has been declining but has not disappeared.

Unlike in other regions of the world, following the abolition of apartheid in the early 1990s South Africa has brought homosexual identities to the foreground, enshrining gay equality in its 1996 constitution. William L. Leap, who has conducted research in the Cape Town area, observes that accompanying this emerging (self-)awareness and visibility are novel ways of "talking about same-sex desires and erotic practices as well as new ways of naming same-sex related identities and subjectivities" (*2004, 134–135*). These new ways of talking rely in part on traditional South African discourses on sexuality, and indeed they also draw on native linguistic resources derived, for example, from languages such as Xhosa and Afrikaans, as well as English. Yet, globalization has had its effects in this arena, too, and the incorporation into local discourse of North Atlantic and European linguistic features and cultural models—through tourism and the media, among other things—has had its effects. The new language of sexual citizenship, for both male and female homosexuals, is still not as formalized as Indonesia's *bahasa gay*. The function of this new code, or language, is not that of an anti-language, such as the one associated with Polari in Britain. In his research, Leap (*2004*) looked at the naming practices of gay bars and the language used in a South African national gay newspaper, in personal ads, and in personal narratives. What is apparent is that in the new South Africa speakers made full use of the existing cultural and linguistic traditions, mixing languages in a creative way. The result is not a cryptic argot, although this new way of talking can be used to conceal, at least in part, one's sexuality. What comes into being is a language that circulates in the wider society and becomes the preferred language used by queer individuals to talk about and among themselves. At the same time, it gives heterosexual South Africans a nonconfrontational way to talk about their fellow, homosexual citizens.

**From Gayspeak to the Lavender Language**

The word *gayspeak* was coined in 1976. From the 1960s the view among scholars changed,
and the vocabulary and expressions used by (still mostly) gay men—although increasingly also the speech of lesbians—ceased to be viewed as “exotic lingo or a mysterious argot” (Kulick 2000, 258). Whereas earlier views implied that gays were using a code that had been bequeathed to them, like an object or a ready meal, research conducted in the 1960s and 1970s recognized greater agency on the part of speakers. They were not, in other words, passive recipients of a prepackaged lingo, and it was recognized that the words and expressions they used existed in, and helped to constitute, a social and political context: to establish and maintain, through discursive practices, communities that were more or less transient. During this period, visibility and assertion replaced concealment (but not for all, of course, especially in non-Western societies), and intragroup homogeneity, rather than difference from those on the outside, became salient.

In addition to the name “gayspeak,” which remains one of the most used, other labels have been suggested. These, as listed by Kulick (2000), are, in chronological order: faglish, gay English, gay speech, lavender language, queerspeak, lgb talk, gay male language, gay and lesbian language, gay male speech, lesbian speech, and lesbian language. The term lavender linguistics was introduced by Leap, one of the most prolific scholars in the field of language and homosexuality, who also initiated the Lavender Languages and Linguistics Conference in 1993. This is now a regular event and attracts researchers from all over the world. Broadly, the term refers to research on how lesbians, gays, bisexuals, queers, transsexuals/transgender, and asexuals use language in everyday life and how particular forms of language use contribute to the formation and affirmation of identities in a variety of sociopolitical contexts. Lavender linguistics comprises, but is not limited to, homosexual argots such as the ones mentioned above. It includes, among other things, the use of language in gay erotica. The advent of lavender linguistics was instrumental in broadening the scope of research, so that, finally, lesbians, bisexuals, asexuals, intersex persons, or simply “queer” individuals were finally included, and not only sexual orientation but sexuality and desire began to be properly investigated.

**Language, Transgender, and Drag Communities**

As a result of the aforementioned broadening of scope, transgenderism (used here as an umbrella term to include transsexualism), like the other forms of gender and sexual nonconformity discussed previously, is highly intertwined with language. An added dimension to the debate, however, is that, especially in cases of sex reassignment, linguistic research is often used to educate transsexuals to speak appropriately, to “pass” as members of their chosen sex. Interestingly, the preoccupation seems higher for male-to-female transsexuals. The phonologists, logopedists, and others who advise transsexuals seem to rely on old, now-discarded models of “women’s language.” For example, they suggest using greater pitch variation, the use of tag questions (i.e., a statement turned into a question to ask for confirmation, for example: “he’s gay; isn’t he?”), and “empty adjectives”
(such as lovely and precious), thus apparently confirming, rather than subverting, gender stereotypes.

The construction and construal of transgender identity has also been studied cross-culturally, with inputs both from linguists and anthropologists. An example is Niko Besnier (2003), who studied language and transgenderism in Tonga. In Tonga (and in the Tongan diaspora) the term fakaleiti (also referred to as leiti or fakafine) refers to individuals who embody a broad range of characteristics. The term consists of the prefix faka (in the manner of) and leiti (lady). A fakaleiti is stereotypically identified as a man who presents “feminine” characteristics, such as talking emotionally and animatedly; and in domestic or rural settings, leiti engage in traditionally feminine endeavors, such as doing the laundry and childcare. Fakaleiti identity is performed and, crucially, identified through linguistic practices. Besnier reports that, in his research, when informants were asked how they identified a fakaleiti, they answered by citing their ways of speaking: tone, intonation, high pitch, a fast tempo. Interestingly, a noticeable feature in the linguistic display of fakaleiti is the use of English, even by relatively uneducated individuals. This practice allows speakers to align themselves with modernity and sophistication, as embodied by the English language. This common signaling of modernity and cosmopolitanism is likely to often operate at a subconscious level and results in frequent use of more or less adapted English words and phrases in the speech of Tongan male transgender individuals.

Another area that has attracted interest is that of the relationship between language and drag—in particular, drag queens. Rusty Barrett (1998) has explored the language of African American drag queens. His work concentrates on the significance of drag queens switching from one language variety (African American drag queen style) to another (white woman style, with its connotations of sophistication) to enact aspects of their race, gender, or sexuality. Stephen L. Mann expands Barrett’s work by “considering examples of drag queen language in which the discreteness of language is no longer clear” (2011, 794).

The language of drag has been receiving increasing attention and exposure, especially thanks to reality television shows such as RuPaul’s Drag Race, broadcast from the United States and with audiences in many countries. Libby Anthony identified and investigated the “meshing of languages” (2014, 64; quoting A. Suresh Canagarajah) as displayed by nonnative speakers of English in the show, which, among other things, exposes viewers to other ways of “doing (and speaking) drag.” Matthew Goldmark (2015) looked at the way the linguistic practices of the show, such as the frequent catchphrases, simultaneously work to include and exclude and to configure a common geographical space (the United States) that can symbolize common values and aspirations.

**Does “Gay Language” Even Exist?**

The idea of a “gay language,” or “gayspeak,” is not uncontested. As soon as the idea of
“gayspeak” was advanced, James Darsey ([1981] 2006) pointed out that nothing that had been identified as constitutive of “gayspeak” (i.e., secrecy, its function as enabler in a subculture, and its ability to be used to resist the dominant culture) was actually unique to gays. The circularity of Darsey’s argument—that the fact that gays do X does not make X gay—has been pointed out. For Cameron and Kulick ([2006]), to postulate something like the existence of a “gay language,” researchers would have to actually document how LGBTQI+ people use language in empirical ways. Because of the many ways, cultures, and situations in which LGBTQI+ live, generalizations are rarely possible. And even if it were achievable to document that something like gayspeak existed, in what sense would that language be “gay”?

Despite these doubts and ongoing debates, work on the language-sexuality nexus continues. Work since the late 1990s, for example, has expanded the existing methodologies by using, among other tools, vast searchable databases of texts stored on computers. These are called “corpora” (the plural of corpus, or “body” in Latin) and use the methods of the subfield of linguistics known as corpus linguistics. This might go some way toward solving the issues of generalizability. And with the new development pointing to investigations of “language and desire,” rather than language and gender or sexuality, the field is likely to remain active and productive in the years to come and to finally gather data from more areas of the world and different sociocultural groups, thus putting sounder foundations under possible generalizations. One such sociocultural group comprises deaf LGBTQI+ individuals in different countries. It is now generally accepted that signed language, such as British Sign Language, American Sign Language, and Lingua dei Segni Italiana, to name only three, are fully developed languages like their oral counterparts. As such, they too exhibit internal sociolinguistic variation; many LGBTQI+ signers are aware of specialized signs used by their community, or at least members thereof. In truth, work variation in the gay deaf community was investigated as early as 1981 (Rudner and Butowsky) and 1996 (Kleinfeld and Warner). It was noted by William A. Rudner and Rochelle Butowsky (1981) that in the United States, gay deaf women appeared more reserved about the use of special gay signs, and deaf heterosexual women knew more signs than gay deaf men. Mala Silverman Kleinfeld and Noni Warner (1996) chartered the spread of the accepted sign for “gay” among gay and nongay deaf students. Interestingly, and similar to what has been happened in their hearing counterparts, the adoption of preferred signs to referred LGBTQI+ identity has been pushed from within the community until it became, in many cases, the favored option among the larger population.

The ways in which the West has imagined African sexuality has, in part, led to the belief that homosexuality is a fundamentally Western phenomenon introduced to African people through colonialism. Western hegemonic interpretations of African practices and perceptions of gender, sexuality, and queer identities are not new, and they present interesting issues of translation. These issues are not limited to questions concerning the equivalence of terms relating to queer identity and intimacies between the Western world and African societies. Instead, issues of translation highlight deeper historical underpinnings between varying social, cultural, and political behaviors relating to identity. The translation and terminology of African sexuality are frequently encumbered by colonial misinterpretations and distortions.

The Colonial Legacy
